## CONTENTS OF VOLUME 1.

### THE COMMISSIONER'S INTRODUCTION.

	Page.
Total enrollment in schools and colleges.....	IX
The common schools.....	XII
The average amount of schooling per inhabitant.....	XVIII
Franklin's influence on education.....	XX
The college-bred negro.....	XX
Francis W. Parker.....	XXI
Northern churches and the freedmen.....	XXII
Laws relating to temperance instruction.....	XXV
Education in Canada.....	XXVI
Education in British South Africa.....	XXVIII
Early English writers on education.....	XXX
Medical inspection of schools abroad.....	XXXI
Admission to college on certificate.....	XXXII
Miscellaneous educational topics.....	XXXII
Educational progress in 1901-2.....	XXXIV
Education in France.....	XXXVI
Education in Italy.....	XLI
Illiteracy of the voting population.....	XLVII
Commercial schools in Switzerland.....	XLVIII
Henry Barnard.....	XLVIII
Length of college course.....	L
Oxford University and the Rhodes scholarships.....	L
Education in Great Britain and Ireland.....	L
The educational problem in England.....	LIV
Correspondence schools.....	LXI
Universities, colleges, and schools of technology.....	LXII

### STATISTICS OF STATE SCHOOL SYSTEMS.

Total population, school population, and adult male population.....	LXVII
School ages and State school censuses.....	LXIX
Enrollment of pupils.....	LXX
Average daily attendance.....	LXXV
Length of school term.....	LXXVIII
Teachers.....	LXXX
School moneys received.....	LXXXIII
School expenditures.....	LXXXV
Wealth and school expenditure.....	XCI
Permanent school funds.....	XCII
LEGAL PROVISIONS GOVERNING THE PRACTICE OF MEDICINE.....	XCVII
LEGAL PROVISIONS GOVERNING THE PRACTICE OF DENTISTRY.....	CH

### CHAPTER I.—GENERAL LAWS RELATING TO AGRICULTURAL AND MECHANICAL LAND-GRANT COLLEGES.

Presidents of colleges for women .....	1168
Presidents of schools of technology .....	1169
Principals of normal schools .....	1170

# REPORT OF THE COMMISSIONER OF EDUCATION.

---

DEPARTMENT OF THE INTERIOR,  
BUREAU OF EDUCATION,  
*Washington, D. C., July 22, 1903.*

SIR: I have the honor to submit herewith the Annual Report of this Office for the year ending June 30, 1902.

The enrollment in schools and colleges, public and private, during the year 1901-2 was 17,460,000, the same being an increase of 160,770 pupils over the previous year. Of this number there were enrolled in public institutions supported by taxation and funds belonging to States and municipalities 16,041,016, as against 15,710,394, the number reported for the previous year.

Besides the enrollment in schools and colleges, as given above, there were pupils enrolled in special institutions more or less educational in their character and more or less of a practical or business character as follows:

*Enrollment in special schools, 1901-2.*

City evening schools, estimated .....	207, 162
Business schools.....	137, 247
Schools for defectives.....	28, 827
Reform schools.....	35, 247
Government Indian schools.....	24, 120
Indian schools (Five Civilized Tribes) .....	13, 864
Schools in Alaska supported by the Government .....	1, 741
Schools in Alaska supported by incorporated municipalities (partly estimated) .....	1, 700
Orphan asylums and other benevolent institutions.....	15, 000
Private kindergartens .....	105, 932
Miscellaneous (including schools of music, oratory, elocution, cookery, and various special arts) .....	50, 000
Total .....	620, 840

Adding the enrollment in these special schools to the total of schools giving general education, we have a total of 18,080,840.

The general items of statistics for the country as a whole and for the five census divisions may be seen in the following three tables.

In Table I is given a comparative summary of items of attendance of pupils, the number of teachers, receipts and expenditures, showing the increase from decade to decade for more than thirty years in what are called common schools, including under this designation schools of the elementary and secondary grades supported from public funds.

It will be seen that in the past six years the per cent of the total population enrolled in the common schools has not materially changed, being between 20 and 21 per cent of the entire population and about 72 per cent of the entire number of persons from 5 years to 18. The number in daily attendance during the sessions of the schools has risen from about 4,000,000 in the year 1869-70 to nearly 11,000,000 in the past year. The attendance has increased in regularity somewhat in the past thirty years. But the greatest increase has been in the length of the school term. This is due to the growth of villages and cities. A continually growing per centum of the population lives in large villages and cities and holds its schools open for a larger number of days each year. The average term of all schools was 132 days in 1870 and 145 days the past year. The average number of days attended by each pupil enrolled in the schools reached 100 days the past year for the first time in the history of the schools. The normal length of the school session in villages and cities is nine or ten months of 20 days each, vacation days being excluded, but public holidays such as fall within the school year—for example, Washington's Birthday and Memorial Day—are included in the school year, which amounts in cities to 200 days and perhaps in the majority of villages to 180 days.

The number of women teachers has risen to 317,204 out of a total of 439,596 teachers in the common schools of the United States. It will be noticed that twenty-two years ago the percentage of male teachers was nearly 43, while the past year it had fallen below 28. The average salary of teachers shows a very slight increase, that of male teachers being nearly \$50 a month and that of women teachers being nearly \$40. The aggregate of school property arose to more than \$600,000,000 the past year, its increase being \$25,000,000 over the previous year and an increase of \$471,188,299 over the value of common school property in 1869-70.

The amount of money for the support of schools derived from local taxation—that is to say, municipal and county taxation—has steadily increased, due chiefly to the incorporation of large villages into cities and the provision for the schools out of the municipal tax fund. The increase of income from local taxes the past year was nearly \$10,000,000 over the previous year, and the increase of receipts from all sources over the previous year, for the use of schools, was nearly \$15,000,000.

The average expenditure per pupil of average attendance has

increased pretty constantly since 1880, the total expenditure being \$12.71 per pupil of average attendance in 1880 and \$21.38 per pupil in 1902. The percentage of expenditure for several purposes is shown in Table I to be as follows: 17.7 per cent for sites and buildings; salaries of teachers and superintendents, 63.8 per cent; other purposes, such as janitor hire, fuel, apparatus, text-books for indigent pupils, etc., 18.5 per cent.

TABLE II.—Number of pupils and students of all grades in both public and private schools and colleges, 1901-2.

NOTE.—The classification of States made use of in the following table is the same as that adopted by the United States census, and is as follows: *North Atlantic Division:* Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, and Pennsylvania. *South Atlantic Division:* Delaware, Maryland, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, and Florida. *South Central Division:* Kentucky, Tennessee, Alabama, Mississippi, Louisiana, Texas, Arkansas, Oklahoma, and Indian Territory. *North Central Division:* Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, Iowa, Missouri, North Dakota, South Dakota, Nebraska, and Kansas. *Western Division:* Montana, Wyoming, Colorado, New Mexico, Arizona, Utah, Nevada, Idaho, Washington, Oregon, and California.

Division.	Pupils receiving elementary instruction (primary and grammar grades). <sup>a</sup>		Pupils receiving secondary instruction (high-school grades). <sup>a</sup>		Students receiving higher instruction.								Total higher.		
	Public.	Private (largely estimated).	Public. <sup>b</sup>	Private (in preparatory schools, academies, seminaries, etc.). <sup>c</sup>	In universities and colleges. <sup>e</sup>		In schools of medicine, law, and theology. <sup>e</sup>		In normal schools. <sup>g</sup>						
					Public. <sup>d</sup>	Private.	Total.	Public. <sup>f</sup>	Private.	Total.	Public.	Private.		Total.

<sup>a</sup> Including pupils in preparatory or academic departments of higher institutions, public and private, and excluding elementary pupils, who are classed in columns 2 and 3.

<sup>b</sup> This is made up from the returns of public and of private secondary students according to the character of the institutions in which they are found, is given in Chap. XXXIX., vol. 2, organized high schools whom there are no means of enumerating.

<sup>c</sup> Including colleges for women, agricultural and mechanical (land-grant) colleges, and scientific schools. Students in law, theological, and medical departments are excluded, being tabulated in columns 9-11. Students in academic and preparatory departments are also excluded, being tabulated in columns 4 and 5.

<sup>d</sup> Mainly State universities and agricultural and mechanical colleges.

<sup>e</sup> Including schools of dentistry, pharmacy, and veterinary medicine.

<sup>f</sup> Mainly in schools or departments of medicine and law attached to State universities.

<sup>g</sup> Nonprofessional pupils in normal schools are included in columns 4 and 5.

<sup>h</sup> There are, in addition to this number, 29,065 students taking normal courses in universities, colleges, and public and private high schools. (See Chap. XXXVIII., vol. 2.)

In Table II the pupils are enumerated according to their grades of work, as elementary including the first eight years of the course of study, secondary including the ninth to the twelfth year's work of the course of study, and higher education including all higher instruction, which in colleges goes on from the thirteenth to the sixteenth year's work of the course of study, and in medical schools, divinity schools, and law schools for the most part including the thirteenth to the fifteenth year's work of the course of study. The tendency is to require a bachelor's degree for entrance upon the work of the professional school, but this tendency has not yet come to prevail extensively.

The enrollment in normal schools, which is counted in higher education, because of the severity of its methods of work rather than for the advanced grade of its topics, is shown separately in columns 12, 13, and 14 in Table II. In pursuing a branch of study in the normal school, the pupil is required to study it in the light of other related branches and to note especially the method of instruction in the branch. This general practice in normal schools requires more maturity than the grade of work done on the secondary course of study in high schools.

The number of secondary pupils enrolled in public high schools and other public institutions the past year is given at 566,124, an increase of about 8,000 over the previous year. The number of pupils of secondary rank in private academies and higher institutions was 168,636, the same being a decrease of nearly 9,000, so that the total number of secondary pupils has slightly decreased during the past year from the year previous.

The following table shows the movement of secondary students in public and private institutions in the past ten years; also the same figures reduced to per cent of population:

*Secondary students and per cent of population.*

Year.	In public institutions.		In private institutions.		In both classes.	
	Secondary students.	Per cent of population.	Secondary students.	Per cent of population.	Secondary students.	Per cent of population.

1901-2.....	6,292	22,415	550,611	1,835	9,903	104,690	8,127	32,318	655,301

The enormous increase of secondary instruction in public high schools in recent years is due to the policy adopted by large villages and counties to provide for free secondary instruction from public taxation. The number of public high schools increased from 2,526 in 1890 to 6,005 in 1900, and to 6,292 in 1902.

The number of students in universities and colleges the past year was 119,496, the same being an increase of 4,225 over the previous year. This number includes students in scientific schools. The number reported in the regular professional schools, of medicine, law, and theology, has reached 61,499. Adding together these, with the number in normal schools, the grand total in higher education of all sorts amounts to 246,063 students, of whom 99,616 are in institutions supported by public taxes and 146,447 in institutions supported by private corporations.

In the following table (III*a*) the variation of increase of the school system in the United States for the past twelve years is shown. In my Report of last year I have discussed these variations and endeavored to account for irregularities from year to year. I pointed out, for instance, the waves of increase of productive industry in the country. During the rising tide of these waves there is a movement of the population from farming to industries connected with manufacturing, transportation, and commerce. In the ebb tide there is a cessation and sometimes an actual return wave from manufacturing and commerce to agriculture. The commencement of the ebb tide, therefore, shows an actual increase of pupils enrolled in the elementary and secondary schools because the loss of remunerative employment is accompanied by an attempt to make the days and months of idleness remunerative in the shape of increased education.

The increase in secondary and higher education has taken the form of an ascending wave, which reaches its maximum when the majority of the community begin to find themselves burdened with debt and with high taxes, and therefore elect school committees who reverse the policy of school expenditure. The reversal sometimes continues for several years.

TABLE IIIa.—*Increase in twelve years of the total number of persons receiving education and of the total population.*

School year.	Pupils, public and private, of all grades.	Increase over preceding year.	Per cent of increase.	Estimated population.	Increase over preceding year.	Per cent of increase.

#### THE AVERAGE AMOUNT OF SCHOOLING PER INHABITANT.

In Table IV *a* the average number of years of schooling measured according to the city session of schools of 200 days each is given. The scale gradually ascends from 1870 to 1902, having for the past six years exceeded five years of 200 days each as the average education given to each member of the population. The maximum was reached in 1900, when about five years and a quarter of 200 days each, that is to say, 1,046 days, would have been given to each individual in the country at the rate of public instruction for that year. The following year (in 1901) the rate decreased to 1,028 days, and the rate of the

past year was 1,032 days for each individual of the population. This table takes into account public and private schooling of whatever grade.

The following table, IV *b*, gives the same item, taking into account only the schooling furnished in elementary and secondary schools supported by public taxes. It seems that the past year shows a rate of instruction which if continued for the school age would give 930 days instruction in public schools to each individual of the population.

TABLE IV *a*.—Average number of years of schooling (of 200 days each) that each individual of the population received at the different dates specified in the table, taking into account all public and private schooling of whatever grade.

In my last Report I called attention to certain estimates which I have made on the entire amount of schooling in former epochs, which are briefly summarized as follows:

The average amount of schooling to each individual of the population did not exceed in—

	Days.		Days.
1800 .....	82	1870 .....	672
1840 .....	208	1880 .....	792
1850 .....	420	1890 .....	892
1860 .....	434	1902 .....	1,032

*Laws relating to agricultural and mechanical colleges.*—In Chapter I is given the first installment of a compilation of the general laws relating to the colleges established under the acts of Congress of July 2, 1862, and August 30, 1890, for the establishment and for the more complete endowment and support of colleges for the benefit of agriculture and the mechanic arts. The chapter opens with the acts of

Congress relating to these institutions and is followed by the State legislation in the following-named States: Alabama, Arizona, Arkansas, California, Colorado, Connecticut, Delaware, Florida, Georgia, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, and Louisiana. The legislative provisions given have been taken from the revised statutes or codes of the several States, except in the case of Idaho, and include only such laws as are now in force. It is hoped that the legislative provisions of the other States will be published in future Reports.

*Franklin's influence in education.*—In Chapter II (pp. 91–190) Professor Thorpe, of the University of Pennsylvania, has given the results of a long study devoted to the life and work of Dr. Franklin. While Thomas Jefferson stood for the political point of view of American affairs, Dr. Franklin stood for its economical point of view. His mind was bent upon seeing the conduct of life from the point of the social and industrial individual. His chief interest was the self-help of the individual, especially in the making of a fortune by industry and economy. He anticipates this age in the great interest which he felt in experimental natural science. The article has been prepared by its author to show Franklin's influence in American education, and the glimpses given of the ideas of Franklin's contemporaries on the subject of education add value to this study and give point to the presentation made of Franklin's ideals.

*The college-bred negro* (Chapter III, pp. 191–229).—A number of institutions for the higher education of the negro have united, under the lead of Atlanta University, in the investigation of certain phases of the "negro problem," and have held five annual conferences in connection with this movement. A concerted inquiry of this character, made by members of the race in question, should result in the collection of much valuable material, a study of which may be expected to throw light on existing conditions. Indeed, a considerable body of statistical and other data has already been gathered relating to the mortality and general condition of negroes in cities, the success of negroes in business and in promoting their social betterment, and kindred topics. The fifth conference, held at Atlanta in May, 1900, was devoted to an inquiry regarding college-bred negroes, their number, distribution, occupations, and success in life. A report on this subject was made to the conference by Prof. W. E. Burghardt Du Bois, of Atlanta University, a considerable part of which is reprinted in Chapter III. The report was based on a study of 2,331 graduates, of whom 1,941 were from negro and 390 from white colleges.

A considerable number of unsolicited statements by college authorities are given by Professor Du Bois, tending to show that the standing and character of negro students in Northern white colleges are at

least as good as those of the average white student. The chosen field of the college-bred negro would seem to be in the South. Nearly 90 per cent of the Southern-born graduates remained in the South, while of the Northern born about 50 per cent went South.

A large number of brief statements by the graduates show the character of their early life and training, their struggles and ambitions. These narratives possess great human interest and are well calculated to awaken sympathy; that there are so many earnest spirits among the youth of the race is an encouraging sign.

Of the 1,312 graduates reporting their occupations, over one-half are teachers, one-sixth are preachers, and one-ninth lawyers or doctors; about 4 per cent are in business, and less than 3 per cent are farmers or artisans. Statements by a number of lawyers and doctors as to their practice and treatment by the community are given. The assessed value of real estate owned by 557 negro college graduates is shown in a table. Only 23 had real estate to the value of \$10,000 or over. The average was \$2,411. About one-fourth of the whole owned between \$1,000 and \$2,000 worth of this kind of property.

Not the least valuable are the numerous replies to the questions, "Are you hopeful for the future of the negro in this country?" and "Have you any suggestions?" This unique collection of views and opinions, apparently for the most part expressed with great candor, exposes the underlying currents of thought in the minds of educated negroes as to the needs and prospects of their race. As summed up by Professor Du Bois, of 733 answers received 641 were hopeful, 40 were doubtful, and 52 were not hopeful. As to what the race most needed, 125 suggested college and industrial training, 49 an accumulation of land and wealth, 47 better-trained leaders, 34 more unity among themselves, 17 a more friendly feeling between the races, 8 better sexual morals, 8 keeping out of politics, 7 the emigration of some, 6 economy.

*Francis W. Parker* (Chapter IV, pp. 231-283).—The recent death of Francis W. Parker has recalled attention to his work as school superintendent in Quincy, Mass., from 1878 to 1880, and subsequently as principal of the Cook County Normal School, in Illinois. In Chapter IV are collected a number of papers, memorial and other addresses, etc., in which the work of Colonel Parker as an educator is reviewed and summed up, and estimates are given of the value of what has come to be known as the "Quincy method." An account of the work of the Cook County and Chicago Normal School from 1883 to 1899 by Colonel Parker himself is included, presenting the successive steps by which that school was brought to realize in a high degree his ideal.

*The northern churches and the freedmen.*—In Chapter V (pp. 285-314) Rev. A. D. Mayo records the history of the missionary and educational efforts of certain northern churches in behalf of the freedmen of the

Southern States. This intervention began with the missionary activity of the American Missionary Association, a strict antislavery organization, in 1861 among the "contrabands" at Hampton, Va. Between 1866 and 1870 this association received \$243,753.22, during which time its sphere of action had vastly extended. The Freedman's Bureau turned over a large sum of money to it, which was expended in buildings for schools at Hampton, Va., Nashville, Tenn., Charleston, S. C., New Orleans, La., and elsewhere. It is estimated that the people of Great Britain contributed not less than \$1,000,000 in money and clothing for the colored people during these years. Many rural schools for negroes were also founded in the Southern States by the association in these early years. The author speaks of the ridicule excited by the exalted titles of the schools established during this period, and gives details of the founding of a number of institutions which have since become more worthy of the name of colleges and universities. In 1870 the American Missionary Association was giving instruction to 21,840 pupils. The Freedman's Bureau withdrew its aid at this time, after having disbursed \$213,000 for Southern education through this agency. The teachers sent to the slave States as a rule "were not received in any proper social or even religious fellowship by the white people among whom they came to serve," from easily understood reasons, although, adds the author, "there was no considerable portion of the superior people of the South who ever showed any persistent and public hostility to this work." By 1880 the association had 8 chartered "institutions of the higher education under the titles of college, university, and institute; 111 high and normal and 35 common schools, instructed by 230 teachers and missionaries." In 1886 it began founding schools among the 2,000,000 white mountaineers in the Southern Appalachians, who were largely illiterate. In 1896 the receipts of the association were \$340,793.65 and expenditures \$311,223.35, with a debt of \$66,000. It had expended \$11,610,000 from 1860 to 1896. This association has, more than other church organizations, "discouraged the mischievous habit of ingrafting the old-time parochial school" on the churches it has developed. In 1891 it reported 8 higher and secondary schools, 4 seminaries for the mountain whites in North Carolina, Tennessee, and Kentucky, and 93 normal, industrial, and graded schools. The association is under the auspices of the Congregational Church.

As early as 1862-63 the churches of the various denominations took steps to aid the negroes, and it was decided in 1863 that the chief need was schools and teachers. Teachers were sent to the seaboard in 1862 and up the Mississippi in 1863, i. e., even during the civil war. It was, however, decided by the various churches that the educational workers among the negroes must be church members, a decision which

prevented cooperation between the different denominations, and which rendered the secularizing of the schools for negroes impossible for a number of years. The Methodist Episcopal Church organized the Freedmen's Aid Society in 1866. By March 1, 1868, notwithstanding the financial depression of the country, \$58,477.69 (\$54,231.73 in cash) had been collected, of which \$35,815.83 was expended in 9 States. There were 59 schools, with 124 teachers and 7,000 pupils. A large number of the teachers were ministers of the gospel, who labored both in church and school, and they all taught in the Sunday school. The superintendent spoke especially of the work of the schools in promoting the morals of the pupils. By 1878 the school-work (leaving out of account the great church work in the South) showed 5 chartered institutions, 3 theological schools, 2 medical colleges, 10 academies, with an attendance of 2,040 students, 1,000 of whom were normal, in 11 States. Of the 6,000,000 colored people it was estimated that 64 per cent were "in the darkness of ignorance." The Freedmen's Aid Society's school work was distinguished by the attention given to industrial training. During the first thirty years of its existence the society expended more than \$6,000,000. In 1901 it had 47 institutions "of Christian learning," about equally divided between negroes and poor whites, in all the former slave States, with lands and buildings worth \$2,165,000. The number of students in all the industrial schools was 2,906 in 1901. Of the \$90,625 annual appropriation \$79,975 was for institutions for colored students, consisting of 1 theological school, 2 medical schools, 10 colleges or universities (so entitled), and 10 academies. There were also 3 universities and 22 academies for white students. It expended \$171,773.01 for colored schools during the year 1900.

The author ascribes the want of success in raising funds in the North for educational propaganda among the negroes in the South largely to the fact that the denominations persisted in adhering to the parochial school—"the old European method of education"—while the majority of the people had become familiar with the public school system. He says that after thirty years of effort more than 50 per cent of the colored people of the South over 10 years of age can neither read nor write. The Presbyterian Church (North) in 1865 had declared in favor of special efforts in behalf of the freedmen. The report of its committee on missions for the freedmen in 1871 showed an indebtedness of \$17,789.15. There were then 45 parochial schools, with 58 teachers and 4,530 pupils, besides a theological and 2 normal schools, an academy, and a seminary for colored girls. In 1893 the annual income of the board had risen to \$108,120.85, the number of schools (parochial) to 65, with 6,995 pupils and 129 teachers. The board stated that 76 per cent of the freedmen were illiterate.

In 1896-97 there were 6 "superior" schools and 67 day schools, with 204 teachers and 9,442 pupils. During the twenty-seven years of its existence the board had expended \$1,000,287.

The Protestant Episcopal Church expended \$351,514 from 1866 until 1886 in church and school work among the negroes, when the commission for the colored race was established. The main object of the commission was to "provide educated and consecrated ministers" (colored) to labor among their brethren. Of the five chief institutions established by the Episcopal Church through this commission, only two are of the usual type of normal and industrial schools. These had 23 teachers and 500 pupils in 1900, and are of the better class. From 1886 to 1896 \$441,494 was expended, making a total of \$793,008 for thirty years. In the 15 old slave States and the District of Columbia, with a negro population of 8,000,000, the parochial schools of this church had an average attendance of 4,346 in 1896. There were 61 colored churches and 60 white clergymen engaged in work among the negroes of the South in that year.

The author refers briefly to the early opposition of the Society of Friends, or Quakers, to slavery, and as a result thereof the emigration of large numbers of Friends from slave-holding communities to the free "Northwest" (Ohio and Indiana) in the eighteenth and especially during the nineteenth century. After the close of the civil war efforts were made to prevent the removal of such a desirable population from the Southern States by the Baltimore Association of Friends, which sent supplies of provisions and money to the South. The denominational schools were rehabilitated in North Carolina, including a normal school. This movement extended to the schools for freedmen. In 1867 there were 6 day and 22 Sunday schools with 1,600 or 2,000 colored pupils. In 1869 the number of schools had increased to 24 day and 35 Sunday schools with 1,707 pupils, and after this the movement for colored schools seems to have declined. In 1869 the Pennsylvania Friends engaged in the work for freedmen reported 29 day schools, 40 teachers, and 2,000 pupils. The New York and New England Friends established seminaries and colleges for colored students in North Carolina and Tennessee. In 1895 the Friends of North Carolina reported 6 academies with 530 students and an expenditure of \$1,776.25, and 14 schools, all preparatory for Guilford College, with an attendance of 6,000.

The Baptist Church began its missionary work in the organization of the Home Mission Society in 1832 for the purpose of "preaching the Gospel in destitute regions, more especially in the West," and extended its work to the freedmen in 1861-1865. In 1896 attention is called to the improvement in the provision for educating the colored people in thirty years. These consisted in (1) a system of public

schools from primary to normal supported by taxation, the appropriation for colored schools being 10 per cent of the total amount raised in that way for this purpose; (2) the industrial and normal schools founded by the Peabody, Slater, and Hand funds; (3) the missionary and educational work of the northern churches; (4) the work of the A. B. H. M. Society, which had expended \$3,000,000 in teaching and training colored youth.

There are other important observations on the negro which should be brought out because of their authoritative source. Thus the superintendent of the Baptist education work says (1891), "While remarkable progress has been made by a certain portion of the colored people during the past twenty-five years in everything that pertains to mental, intellectual, and moral advancement, it has been confined to a comparatively small number of the 6,741,951 colored population. The masses of these are still in a deplorable condition." He attributes this to (1) unfavorable conditions; (2) indolent and improvident habits; (3) the one-room cabin; (4) the unkind and often cruel and criminal treatment of the women and children by the men; (5) the comparatively low degree of the social and parental relation, and the presence of ignorant and often unprincipled leaders, ministers and others, who dominate their ignorant fellows; (6) not teaching the subjects best fitted to elevate and instruct the masses of the negroes. The report for 1894 has this to say for competition with the whites, that the negro "must not be handicapped by any inferiority of preparation. He must neither ask nor receive any favor on the ground of race or color." Much of the inefficiency in the colored schools is due to intrusting their administration entirely to the colored members of boards of education. This results in placing the schools under the control of contentious preachers or politicians, and the superintendent is emphatic in saying "no" to the question whether the superintendency and management of colored schools should be intrusted to the colored public school teacher. This course would be retrograde. The weak point of the colored people is their lack of executive capacity and their tendency to jealousy and contention. In 1897 the 29 colored schools of the Baptist denomination were supported at an expense of \$108,869.75. They had an attendance of 5,000. The colored people contributed \$84,216.89 to the expenses.

*Laws relating to temperance instruction* (Chapter VI, pp. 315-338).—The enactment in 1901 by the general assembly of Georgia of a law providing for instruction in the "nature and effects of alcoholic drinks and other narcotics upon the human system" in connection with the study of physiology completes the list of the States and Territories, all of which now have upon their statute books laws of this character more or less rigid in their requirements. The present seems, therefore, an opportune time for reviewing the existing legislation upon

this subject, and I have accordingly caused to be collected and printed in Chapter VI the various State laws requiring this species of instruction.

*Necrology.*—In Chapter VII (pp. 339–422) are given brief obituary notices of educators, school and college officials, and other persons whose gifts or services in the cause of education deserve a permanent record.

*Education in Canada.*—Chapter VIII (pp. 423–463) treats of the conditions of education in Canada, comprising a brief historic outline of the several provincial systems of education, with current and comparative statistics. These Provinces have, like the States of our own Union, independent control of their respective school affairs. Prior to the federation of the Provinces in 1867, education had become a matter of general interest. Both the English and French settlers had brought with them traditional respect for parochial schools and ecclesiastical control of education, but the English settlers were also imbued with the ideas that were tending toward the supremacy of civil authorities in all secular affairs, and the first system of public education organized in the Provinces, namely, that of Ontario, was distinctly a system under public control. With the exception of Quebec, all the Provinces followed more or less closely the lead of Ontario in this respect. The school systems established resemble in many respects those of our own country, but in general they give larger place to central authority. The minister of public instruction in Ontario, for example, is more than the executive head of the system. As a member of the legislature he initiates and largely directs school legislation; he has also extensive power of appointment and important judicial functions. No other Province has given equal authority to its chief officer of education, but all have sought to secure uniformity of school provisions and educational standards by means of the central authority. Ontario is also characterized by very equitable regulations in regard to separate schools for Roman Catholic and Protestant pupils where desired. The latter seldom avail themselves of the provision, only seven separate Protestant schools, with 416 pupils, having been reported in 1900. At the same time there were 355 Roman Catholic separate schools with 42,397 pupils. This Province also has made ample provision and very strict regulations with respect to the training of teachers. Every position, from the lowest in the kindergarten to the highest in a collegiate institute, must be filled by a teacher who has obtained a government certificate. The lowest grade of certificate is valid only for three years, and the holder who during that time fails to meet the requirements for a higher certificate is eliminated from the service. The other Provinces have made great efforts to maintain a high standard of professional qualification on the part of their teachers, but the conditions are not so favorable to this result as in Ontario. The superintendent of education for New Brunswick complains par-

ticularly of a scarcity of competent teachers, which he attributes very largely to the more lucrative employments that attract educated and energetic young persons of both sexes. His discussion in his report for 1901 of the possible means of providing salaries which shall attract young people of ability to the service is given in full in Chapter VIII.

The public school systems of the several Provinces are supported by legislative grants and local funds. The latter are derived from two separate sources, municipal appropriations (made by divisions corresponding to counties and townships in the United States) and district taxes (in Quebec school fees also). The relative proportions from the different sources vary greatly in the several Provinces. In Ontario the local sources furnish about 93 per cent of the school income, and the legislative grant a little above 6 per cent. In Nova Scotia the legislative grant furnishes about 30 per cent and in British Columbia about 65 per cent of the entire income (Tables 4 and 5, p. 427). Nearly all the Provinces have adopted legal provisions for making the distribution of the legislative grant dependent in some measure upon the local effort put forth for the support of the schools, as indicated either by the amount of tax raised or by the average school attendance maintained. In Nova Scotia and New Brunswick the legislative grant is apportioned directly to the teachers.

The school system of Quebec differs in essential particulars from those of the other Provinces. The British Government has always shown great tolerance for the religious convictions of the Roman Catholic population, which forms about 86 per cent of the total population of this Province. The public schools are in charge of a council composed of two committees, one intrusted with the interest of the Roman Catholic schools and the other with those of the Protestant schools. The council acts as a whole in respect to all school questions in which the interest of Roman Catholics and Protestants are collectively concerned. School questions pertaining exclusively to the interests of either denomination are decided by that one of the two committees which represents the religious belief of the persons concerned. The executive head of the system is the superintendent of public instruction, who administers the affairs of both classes of schools. He is ex officio a member of the council of public instruction and of each of its two committees, but he may vote only in the committee of the religious faith to which he belongs. By this arrangement the Roman Catholic population virtually have a system of parochial schools under ecclesiastical control, since the law provides that the Roman Catholic committee of the council shall consist of the bishops and certain subordinate ecclesiastical officials of the Roman Catholic dioceses as ex officio members and an equal number of Roman Catholic laymen appointed by the lieutenant-governor in council. The extent of the elementary school work under this particular committee may be inferred from

statistics given (p. 441). It will be noticed that the elementary schools correspond practically to the first four or six years of the public schools in the United States. In 1900 they enrolled 201,124 pupils, of whom 169,729, or 84 per cent, were in parochial schools under the control of the Roman Catholic committee of the council, 4,884 were in independent Catholic schools, and only 26,511, or 13 per cent, in Protestant public schools. Since 1875, when this particular organization was effected, this system has been found to work very satisfactorily. Quite recently there have been signs of dissatisfaction with the parochial schools, but almost wholly because of their failure to adapt their instruction to modern requirements. Both committees of the council have, however, shown great interest in increasing the efficiency and elevating the standard of their respective schools. This unique system is described very fully (pp. 438-445), and offers very marked contrast with that of Ontario, which is also described quite fully (pp. 427-438).

The accounts of the public school systems of the separate Provinces contained in Chapter VIII include in each case retrospective tables that enable one to see at a glance the progress that has been made during an extended period. The survey includes also a brief review of higher education, for which provision was begun at an early date and has been continually increased. The preparation for the universities is made either in the high schools, which are especially flourishing in Ontario, or in academies, which generally have a semi-public character, as in Quebec. Under the head of "Higher educational institutions" are included universities that confer degrees, and classical colleges, which are either affiliated with a university or prepare students for matriculation (tables, pp. 460-461). Recently much attention has been given to scientific and technical education. The Ontario Agricultural College, at Guelph, which dates from 1874, is an institution of marked distinction. A special impulse has been given to provision for technical instruction within the last three years through the bequests of Sir William Macdonald, whose liberal benefaction to McGill University, amounting to \$2,500,000, was speedily followed by a provision for a central manual training school in each Province, with a fund sufficient to maintain the same for three years.

*Education in British South Africa.*—Chapter IX (pp. 465-480) presents a somewhat extended sketch of the history of educational work in the late South African Republic, prepared by Mr. John Robinson, secretary to the director of the council of education, Witwatersrand, a local body formed in 1895 to foster education in the important district mentioned, which includes Johannesburg and the surrounding mining region. The paper is written from a purely English standpoint, but for this reason it has a peculiar historic interest, not only as setting forth the educational needs of the district, but because it

throws some light on the internal conditions that helped to precipitate the late war and discloses also among the English settlers in the Transvaal that impulse to concerted civic action which is everywhere characteristic of the race.

This paper is preceded by a brief survey of education in the several British colonies of South Africa. Cape Colony, which has a population of 1,527,224, of whom 376,987 are white and 1,150,237 are colored, reported in 1899 an enrollment of 147,424 pupils in schools supervised and partly supported by the Government. Of this enrollment 59,825 were white children and 87,599 were colored children; the former comprised 15.8 per cent of the white population and the latter 7.6 per cent of the colored. The schools for the colored children are chiefly mission schools, supported in a great measure by the church. The educational standard of these schools appears to be very low, but recent efforts for the improvement of the teachers and other essential conditions seem to promise better results in the near future. The general condition of the schools for the white children is reported to be very satisfactory. Higher education is fostered by the Government, which apportions grants to six colleges having departments of classics, mathematics, and physical sciences. The University of Cape Colony is merely an examining and degree-conferring body. There is also a Government school of agriculture at Stellenbosh. Among several private seminaries which receive some aid from the public treasury one of the most important is the Huguenot Seminary at Wellington, founded through the efforts of the Rev. Andrew Murray, whose action was inspired by reading the life of Mary Lyon. In response to an earnest appeal for assistance in his enterprise, two graduates of Mount Holyoke went out to the colony in 1874 and took charge of the institution at Wellington, which under their leadership has educated more than 1,000 young women, many of whom have become teachers in colonial schools or missionaries in the surrounding regions.

Since the annexation of the Transvaal by the British Government a system of public education has been organized in that colony, and considering the circumstances remarkable progress has been made in the practical work of establishing new schools and reviving those that had been broken up by the war. It is interesting to note that while according to the statistics of the late Transvaal Government 14,700 children were under instruction at the outbreak of the war, the number under instruction had reached 15,000 early in 1902. A similar work is going on in the Orange River Colony. The director of education for the Transvaal, Mr. E. B. Sargent, has given special attention to devising means for bringing the children living on the isolated farms within reach of educational advantages. For this purpose a particular form of "traveling school" has been adopted (see p. 479). It is purposed

to establish a permanent school in every village, and in every province a school of high grade located in the most important town. Every endeavor is being made to attract university men to the post of provincial headmaster. The salary offered for this position is £500 a year, with a house, together with £250 for an assistant. The system, which has been carefully worked out in all its details, is to be applied alike to the Transvaal and the Orange River Colony.

*Early English writers on education* (Chapter X, pp. 481-508).—In this interesting chapter Prof. Foster Watson, of University College, Aberystwith, Wales, gives brief biographical notices of the famous pioneers of the new education of the sixteenth century in England, together with some account of their works on education, with extracts. Some of the names of these early educators are not familiar to the ordinary reader, such as those of Lupset, Vivès, and Palsgrave, for example, while Lily's name perhaps may be known to a few as the author of the famous Latin grammar which served as a text for Charles Lamb's "Old and New Schoolmaster" in the *Essays of Elia*, and which was actually authorized by royal proclamation of Henry VIII in 1540 as the only grammar to be used in all England. Roger Ascham's book, the "Scholemaster," however, is a part of English literature, like his "Toxophilus," a treatise on archery, while the name of Sir Thomas More is sacred as that of one of the martyrs of history and a noteworthy philosopher of the Platonic type of mind. All these early writers treated education as a sacred subject, almost on a parallel with religion, with which it was associated. A curious historical fact is brought out in Palsgrave's dedication of his translation of a Latin play to Henry VIII. In speaking of the incompetency of schoolmasters, he says that some of them came to the universities from their "native countries" (i. e., different parts of the Kingdom), where the language was rude, and learned to write and speak Latin, but were not conversant with good English, so that when called upon to preach, or "to have other administration requiring their assiduous conversanting" with the King's subjects, they had been forced to read English authors to remedy their imperfections.

Henry VIII showed his appreciation of the importance of education when he said in his proclamation prefixed to and authorizing Lily's grammar: "Among the manifold business and most weighty affairs, appertaining to our regal authority and office, we forget not the tender babes, and the youth of our realm, whose good education and godly bringing up, is a great furniture to the same and cause of much goodness."

The higher education of women in the sixteenth century is illustrated in the often quoted passage from Ascham's account of his visit to the ill-fated Lady Jane Grey. "I came to Brodegate in Leicestershire to take my leave of that noble Lady Jane Grey. \* \* \* I

found her in her chamber reading *Phaedon Platonis* in Greek, and that with as much delight as some gentleman would read a merry tale in Bocace [Boccaccio]. \* \* \* I asked her why she would lose such pastime in the park? Smiling she answered me: 'I wisse, all their sport in the park is but a shadow to that pleasure that I find in Plato; alas good folk, they never felt what true pleasure meant.' Lady Jane Grey could not have been 16 years old at this time.

So of his pupil Queen Elizabeth he wrote, "Yea, I believe, that beside her perfect readiness in Latin, Italian, French, and Spanish, she readeth here now at Windsor more Greek every day than some prebendary of this church doth read Latin in a whole week." Which statement, allowing for the natural pride of a teacher of so distinguished a pupil, may be taken with some reservation.

The need of public schools for girls was felt and argued by these early agitators on education; the conclusion being that "it is expedient that by public authority schools for women-children be erected and set up in every Christian commonweal, and honest, sage, wise, discreet, sober, grave, and learned matrons made rulers and mistresses of the same."

Thomas Lupset (1498-1530) expresses a truth which has often been repeated since as an argument for reading the classics. After advising his friend to read Aristotle's *Ethics*, Plato's *Republic*, certain philosophical works of Cicero, and especially Seneca, he adds: "These books can lift men above the clay of this earth and set them on a hill of high contemplation from whence they shall look down and despise the vanity which foolish men take."

Again, he urges the reading of classical authors for reasons which apply perhaps with even stronger force to the light literature of the present day than to that of four hundred years ago. He says: "And one thing, believe me, that in reading of these old substantial works \* \* \* shall \* \* \* gender a certain judgment in you, that you shall never take delight nor pleasure in the trifles and vain inventions that men now days write, to the inquieting of all good order: by reason that the most part of men that read these new flittering works lack perfect judgment to describe [discriminate] a weighty sentence from a light clause, the which judgment can not be gotten, but by a long exercising of our wits with the best sort of writers."

The chapter, as shown from these extracts, is an interesting contribution to the history of education, and gives the needed evidence of the state of schools in the century preceding the English colonial settlements in America, setting at rest many questions as to the schools of the home country in which our forefathers were instructed in their early youth.

*Medical inspection of schools abroad.*—Chapter XI (pp. 509-526) contains an account of medical inspection of schools abroad. It is taken

from the "Handbuch der Schulhygiene" of Drs. Leo Burgerstein and August Netolitzky, of Vienna. The authors present arguments in favor of medical inspection and are of opinion that teachers should not act as sanitary inspectors, physicians alone being competent. They state the purpose of medical inspection to be the prevention of injurious results from school attendance. In tabulated form they present facts concerning diseases and mortality of children, showing that medical inspection should not only result in keeping sick children away from school, but also in preventing unsanitary influences during school hours. The authors give a brief survey of what has been done in instituting medical inspection in Europe, stating the number of physicians employed and salaries paid in several countries; also the regulations adopted by the authorities for the proper management of this inspection are quoted. It is found that Paris is the city where medical inspection was first established; it there dates back to 1833.

*Admission to college on certificate.*—Chapter XII (pp. 527-539) deals with the subject of admission to college on the certificate of secondary schools. The first part of the chapter gives the by-laws and rules of the recently organized New England College Entrance Certificate Board, the accrediting systems of different State universities, and a list of the institutions admitting students to the freshman class on the certificate of the principals of certain approved secondary schools. This is followed by an article by Prof. A. S. Whitney, of the University of Michigan, on Methods in Use of Accrediting Schools. Dr. Whitney shows that the accrediting system now in such general use originated at the University of Michigan in 1871, and he gives a short sketch of its origin and progress to the present time.

*Miscellaneous educational topics.*—In Chapter XIII are treated a variety of topics bearing upon educational history, methods, tendencies, etc.

1. The first American public school (pp. 541-550): The beginnings of our public-school system have been made the subject of considerable debate. Dr. W. A. Mowry has examined the circumstances attending the establishment of various early schools in Massachusetts, Rhode Island, New York, and Virginia, and has come to the conclusion that the school founded by the town of Dorchester, Mass., in 1639, can properly lay claim to being the first school designed for the general public and supported by direct taxation, within the present limits of the United States. This school has preserved its identity to the present day and is now in successful operation.

2. School supervision: The State of Massachusetts has developed a complete and effective system of school supervision. The adoption of the system has been heretofore voluntary, the State encouraging it by grants of money, but not requiring it, until it has extended so far as to bring under its influence all but 3 per cent of the school children

of the State. A recent act, however, has made the "employment of superintendents of schools the universal and permanent policy of the State after July 1, 1902." A statement giving some particulars as to the evolution and nature of the system, the duties and qualifications of superintendents, etc., as set forth in the reports of the secretary of the State board of education, is given on pages 550-556. The subject is further elucidated in an able essay, from the report of C. A. Brodeur, superintendent of the Chicopee (Mass.) schools, reprinted on pages 556-560.

3. George Charles Holls: On pages 560-566 are given an account of the life and the labors in the service of philanthropy and education of George Charles Holls, from a memoir by Hon. Henry Barnard. Dr. Holls came to this country from Germany in 1851, at the age of 27. The failure of his attempts to conduct an orphan asylum on the lines to which he had been accustomed in Germany illustrates well the dissimilarity of conditions prevailing in the two countries; subsequently however, under methods of his own devising, he realized more successfully perhaps than ever had been done before the true idea of a home for the unfortunate. His attitude of mind toward the "German-American" question is indicated by his dictum, "In my opinion the first mission of the Germans in this country is to become Americans."

4. The Brothers of the Christian Schools are treated of on pages 566-570. The rise of their schools in this country is set forth, while their methods and the general character of their instruction are recorded with sufficient detail to explain in some degree the success which has attended their efforts, and will be found to afford useful suggestions.

5. "Educational tendencies, desirable and otherwise," forms the subject of a timely essay by Dr. Andrew S. Draper, president of the University of Illinois (pp. 570-579). Dr. Draper is of the opinion that the educational system, at least in the grades below the college, is undertaking too much; that "research" is attempted where drill is needed; that strength is of more importance than "culture;" that children can not elect studies; that so many schemes have been forced into the elementary schools that the structure is incoherent and unsymmetrical. "We have shaped the work of the lower schools," says he, "with too much reference to the demands of the advanced schools, and we have exacted too many things for entrance to the colleges and universities."

6. In an address on rural school libraries Hon. Henry Sabin gives his views as to what such libraries should contain and the purposes they should be made to subserve in rural communities (pp. 579-581).

7. The elaborate programme of the Yale bicentennial celebration in 1901 is reproduced in condensed form on pages 582-583, followed by extracts from some of the addresses made on that occasion.

8. "The kindergarten ideal of nurture," a paper read by Susan E. Blow before the International Kindergarten Union in 1900, appears on pages 594-602. It is her belief that the conscious nurture of the free self-activity of childhood is the distinguishing merit of the kindergarten. It is through stimulating and guiding this self-activity that the child begins to discern the lineaments of his ideal selfhood.

9. A biographical notice of Joseph Le Conte (pp. 602-609), taken from a paper read by Prof. S. B. Christy before the American Institute of Mining Engineers, affords some instructive details of the career of this distinguished man of science and educator, whose devotion to his work was so whole-hearted that he could declare, "Although I have gone over my course in geology now fifty times, I am still as interested in it as ever." Contrary to the view held by some, he was firmly of the opinion that investigation should never be separated from teaching and that each was better for being carried on in connection with the other. He will probably be best remembered for his contributions to the theory of evolution, which he endeavored to show contained no materialistic implication and did not violate fundamental religious beliefs.

10. Those portions of the addresses delivered at the recent Johns Hopkins University celebration that are of general interest, as well as extracts from those delivered at the installation of Dr. Butler as president of Columbia University, are given on pages 609-632. These addresses touch many sides of the problem of the conduct of universities and are of permanent value, containing as they do the well-considered views of some of the ablest exponents of higher education in the United States.

11. A collection of statements of city superintendents as to the benefits of and objections to free text-books, followed by a table of the average cost per pupil of free text-books in cities, compiled by State Superintendent J. E. Hammond, of Michigan, is printed on pages 632-640.

12. Technical education in Germany, by Professor Alderson, of the Armour Institute in Chicago, and a report by a committee of the Western Drawing Teachers' Association on the teaching of drawing in Western normal schools, conclude Chapter XIII. The committee on drawing finds that drawing is not well taught in these schools and that their graduates are at a disadvantage in not being sufficiently prepared to give instruction in this important branch.

*Educational progress in 1901-2.*—The survey of the educational progress of the year 1901-2, Chapter XIV (pp. 647-666), is a reprint of an address by Dr. W. R. Harper before the National Educational Association. The review is necessarily limited to events of unusual importance, many of which, for reasons clearly stated in the introductory paragraph, pertain to movements that cover a period of several years.

In the field of elementary education Dr. Harper notes, as the most significant event of the year reviewed, the death of Col. Francis W. Parker. The loss of the personal guidance and boundless enthusiasm of this leader fell with peculiar force upon the institution which he had founded at the moment of its entrance upon a larger and fuller life. But the special impressiveness of Colonel Parker's death was due to the outburst of appreciation which it excited from every part of the country and which testified to the high estimation which is entertained of his work as a reformer of educational methods. In respect to measures under consideration during the year, Dr. Harper notes that they relate, in the main, to the practical conduct of schools and of school instruction. Among subjects that have excited special discussion are the selection in each department of study of the most important topics for treatment and the unifying of the various departments of study so that each will contribute to the other and that waste shall be reduced to a minimum. Continued interest has been manifested in the æsthetic training of the young, in efforts for improving the professional training and the professional status of teachers, and, in particular, in various endeavors for increasing the educational advantages of country districts by centralizing rural schools and by introducing practical instruction in agriculture comparable to the manual training provided in city schools.

With regard to the city of Chicago, Dr. Harper notes that after a long period of doubt the position of the kindergarten has been so strongly established that all future budgets must contain liberal provision for this division of educational work.

The work of the Southern Education Board and the organization of the General Education Board in the interests of Southern education mark events of truly national importance.

The address dwells particularly upon movements in the province of secondary education which necessarily affect also the higher province of the college and university.

The tendencies in secondary education which Dr. Harper has specified are as follows: (1) The disposition to give up provision for instruction in Greek to make way for more practical subjects. This he regards as a "movement backward." (2) The introduction of courses of instruction relating to commercial and industrial subjects, which in his opinion is being pushed forward too hastily for the best results. (3) A tendency which, during the present year, has attracted special attention, namely, the substitution of the certificate system for examinations in connection with college entrance—a practice thoroughly established in the West and apparently now gaining ground in the East. (4) Extension of the elective system in secondary schools. With respect to this tendency Dr. Harper says: "I am strongly of the opinion that unless the choice of subjects in secondary work is practically controlled

by the principal, election will prove injurious rather than helpful." (5) The increasing demand for university graduates and for trained specialists as teachers in high schools.

The successful inauguration of the college entrance board in the Eastern States has been followed by the establishment on the part of the North Central Association of Colleges and Secondary Schools of a commission on accredited schools. The first report of this commission, presented at the annual meeting held in Cleveland March 28, 1902, submits the conditions under which secondary schools shall be accredited, basing its recommendations on the definitions of the College Entrance Examination Board of the Middle States and Maryland, the committee of twelve of the Modern Language Association, the committee of seven of the American Historical Association, and the department of superintendence of the National Educational Association. Thus these several associations tend by their influence to unify educational standards throughout the country.

During the year under review the Chicago Manual Training School, which has exercised a great influence upon secondary education in the West, was associated with the new school of education in the University of Chicago. The opinion is expressed that in this new relation the school will enter upon a higher and broader educational work than is possible to an isolated institution of that character.

Among the many movements pertaining to higher education which are passed in review in this paper perhaps the most significant is the extension of university organizations to include departments or schools of technology, and the still more recent provision for commercial education.

These efforts, as Dr. Harper observes, have come from the necessity of adjusting universities more perfectly to the modern environment.

With respect to the very important question of shortening the college course, which is everywhere pressing for attention, Dr. Harper suggests the plan of allowing those who do not contemplate a professional course of study to take the full four years of work in college, and to arrange for the other class to count their early professional work as a part of the work accepted for the bachelor's degree. He notes that a great forward step in the direction of this policy has been taken in the recent action of Yale, and also that this policy has been adopted as the basis for the organization of the schools of medicine and law in the University of Chicago.

*Education in France.*—Chapter XV (pp. 667-719) treats of education in France, reviewing briefly the progress of the work under the Republic and setting forth in particular the important events which have characterized the present year. Under the fostering care of the Government the national system of education has had almost phenomenal development in the short period of twenty-five years. Side by

side with this system church schools of all orders have also flourished unrestrained. The latter, however, preserve historic traditions and social ideals whose continued influence has for some time been viewed with uneasiness by the Government. This feeling has led recently to a reversal of the former liberal policy in respect to rival agencies, and the present disposition seems to be to crush out the schools maintained by religious associations. The action gives special interest to the comparative statistics of the State and clerical schools which are set forth in various tables contained in Chapter XV.

By reference to Table III (p. 674) it will be seen that in 1900 public schools enrolled 75 per cent of all pupils in elementary grades, and private schools the remaining 25 per cent. A few of the public schools for girls still have teachers belonging to religious orders, so that the proportion of secular schools is a little less than the proportion of public schools, viz, 71 per cent instead of 75 per cent.

In the chief cities (Table XI, p. 684) the ratio of public school enrollment is below that for the country at large, ranging from 40 per cent to 67 per cent. The State secondary schools (table on p. 686) enrolled in 1899 less than 50 per cent of secondary pupils, viz, 83,599, against 91,825 in religious schools and 10,812 in private secular schools. It was in particular the predominating influence of the religious associations in the sphere of secondary education that prompted the law of 1901, subordinating the associations to the civil authorities. This measure did not necessarily imply extreme hostility to the religious orders, but the recent vote of the Chamber of Deputies refusing authorization for all the "religious associations" of men engaged in teaching seems to indicate that the Government will no longer tolerate a system whose general influence is regarded as detrimental to the Republic. The law, and more particularly the manner of its enforcement, mark therefore a crisis of deep import in the republican policies of the country.

These measures, whose purpose is to extend the Government control of education, have been accompanied by increased efforts for the improvement of the State schools of all orders. In the department of elementary education, irregular attendance and too early withdrawal from school interfere seriously with the immediate results and the permanent influence of the school training. The minister of public instruction has ordered a special and minute inquiry into the causes of irregular attendance, with a view to devising corrective measures. The item of annual average attendance is not included in the French statistics, but an approximate average is attained by comparing the enrollment for the months of highest and lowest enrollment, viz, December and June, with the total enrollment. The latest estimates upon this basis (for 1897) give for the public schools an enrollment for December equivalent to 87.5 per cent of the annual enrollment and

for June an enrollment equivalent to 84.6 per cent of the total; the corresponding ratio for private schools was, for both months, 91.1 per cent. These averages, however, obscure the conditions in the districts which fall far below the normal. Pending the results of the special inquiry attention is called to the fact that the "certificate of primary studies," instituted in 1834 and recognized by the law of 1882 as a means of stimulating an interest in elementary study, has conduced in part to the early withdrawal of pupils from school. The certificate exempts the holder from the obligation to attend school, and the reports show that a large proportion of children who come up to the examination for this award are at the minimum age (11 years) allowed for candidates. For the majority of the successful candidates the examination is the end of school life. One remedy suggested for this evil is that of increasing attendance upon the higher primary schools, which can only be done by increasing the industrial adaptations of their courses of instruction. This is more easily accomplished in the cities than in the agricultural sections, where the evils complained of are excessive. The improvement of rural schools has thus become a problem of great moment in France.

The unsatisfactory financial condition of French primary teachers, which has long been a source of serious anxiety to the Government, has led at last to practical measures for their relief from what had become an intolerable strain. A comprehensive investigation into the matter was undertaken at the instigation of M. F. Buisson and the facts elicited reduced to systematic form under the supervision of M. Levasseur, with the collaboration of the statistical division of the labor bureau. The method and the results of this investigation are set forth in full (pp. 710-719). This is probably the most complete presentation of the living conditions of primary teachers, both actual and as compared with those of persons in other employments, that has ever been made for any country.

The presentation created a profound impression. The public press discussed the situation as a "national peril," and as a measure of temporary relief the Chambers voted an addition of 5,011,200 francs (\$1,002,240) to the educational appropriation. Of this amount 3,811,200 francs (\$762,240) were to be used to increase the number of higher salaries, thus giving greater chance for immediate promotion, and 1,200,000 francs (\$240,000) to increase the number of pensions, thus making way for promotions by the retirement of persons past service. In the meantime several bills have been introduced into the Chamber of Deputies, proposing radical changes in the classification of teachers, the conditions for promotion, and the scale of salaries.

The long-pending efforts for the reform of the secondary schools (lycées and communal colleges) resulted in a decree (May 31, 1902)

reorganizing both the internal régime and the curriculum of the schools in question. The new plan of studies is set forth in full, with explanations of its characteristic features (pp. 687-693). The nature of the changes is further emphasized by comparison with previous programmes, which are included in this chapter. These are the programme authorized by decree of 1890, annulled by the new order, and the still earlier programme of 1865, drawn up by Minister Duruy, who was the first to formulate a comprehensive measure for the adjustment of the curriculum of the classical schools of France to modern conditions. His scheme was soon modified, but it has furnished a basis for all subsequent efforts in the same direction.

The chief features of the new programme are the division of the whole course of study into two cycles—the first comprising four years, the second three years. The first cycle offers two parallel courses of study—one including Latin and optional Greek, the other without Latin or Greek. At the end of this cycle students must pass an examination which entitles one to a certificate of secondary studies. This certificate it is believed will have a certain value for the holder who enters at this point upon a practical career.

The second cycle offers a choice between four groups of studies: (a) Latin with Greek; (b) Latin with extended study of modern languages; (c) Latin with fuller study of the sciences; (d) modern languages and sciences with Latin. All four courses lead to the examination for the bachelor's degree. Thus, so far as official recognition goes, the nonclassical course is at last put upon the same footing as the classical.

The historic progress of the movement to secure equal recognition for classical and for nonclassical courses of study, which dates from 1795, is indicated by a chronological table (pp. 697, 698), showing the alternate stages of defeat and triumph through which the endeavor has persisted for over a century.

The department of higher education includes the State universities and a group of special schools of university rank which have combined with the Sorbonne to make Paris a distinguished center of learning.

The chief event in the recent history of this department is the law of 1896, which restored to the isolated groups of State faculties the legal title and the organic unity of universities. In view of the great importance of this change a special report has been issued by M. Liard, director of the department of higher education, reviewing its history and the development of the fifteen universities already organized. This report (which is summarized on pp. 699-704) affords striking proof of the fact that universities can not fulfill their mission as regards either the investigation or the dissemination of truth when

servilely subject to external control. "Civil life," in the words of M. Liard, "is the means of scientific life." The report shows also how profoundly the scientific movement has affected the conception of university education. One of the reasons advanced in favor of the creation of universities is "the daily increase of relations, many and vital, between the different sciences, and the appearance of new sciences, as yet scarcely defined, upon the confines of the older sciences." Inspired by this consciousness, the newly organized universities are multiplying chairs for special sciences and rapidly increasing their scientific equipment, and in this work they are heartily supported by the local authorities in their respective districts. Full particulars of the additional professorships and courses of study which have arisen from this scientific impulse are cited from a special report by M. Maurice Faure, which is an interesting supplement to the more comprehensive report of M. Liard.

From the tabulated statistics (p. 699), it appears that the number of students in the State universities rose from 17,605 in 1887-88 to 28,782 in 1897-98, and to 29,931 in 1901. The specialized character of the universities is indicated by the distribution of their students. In 1901 law claimed 10,152 and medicine 8,627, or both together 62½ per cent of the total number. The students in the faculty of sciences exceeded the number in letters, their registration being, respectively, 3,910 and 3,723.

The specialized character of higher education in France is further illustrated by the maintenance of State technical schools of a high order, which register about 3,500 students. These schools are intended to provide trained experts for the public service. The students are selected by rigid examination, the number in each school being strictly limited.

The comprehensive system of public instruction is supported largely by State appropriations, which in 1901 were nearly ten times the amount allowed for this interest in 1870. The total amount for the latter year was 206,906,483 francs (\$41,381,296), of which 76 per cent was for the primary schools.

The total current expenditure upon public primary schools in 1896-97, the last year for which the analyzed accounts are reported, was 214,015,250 francs (\$42,803,050). Of this amount 67 per cent was met by the State appropriations and 33 per cent by the communes. The expenditure was equivalent to \$9.20 per capita of the enrollment in the public primary schools; this was very nearly double the per capita in 1877. Since 1877 the current expenditure has increased still more. There has also been a noticeable advance since 1877 in the proportion of the expenditures for primary instruction borne by the central Government, i. e., from 25 to 67 per cent of the total. The suppression

of the schools of the religious orders and the proposed increase of teachers' salaries will materially increase this proportion.

Chapter XVI (pp. 721-740) comprises a translation of the closing lecture of the course in pedagogy, delivered at the Sorbonne June 22, 1899, by Prof. Ferdinand Buisson, who, after twenty years' distinguished service as chief of the national department of primary education, was appointed to the chair of pedagogy in the University of Paris.

As we learn from this condensed summary of a season's lectures upon the education of the will, it was Professor Buisson's purpose to make the pedagogy of the will conform to its physiological and psychological growth. He traces the history of the will from its beginnings in the earliest reflex and instinctive movements up to its highest function in self-control and choice. He points out that the will is not a separate mental faculty, but is, in a sense, placed over all the intellectual, moral, and physical actions of the individual, and he draws therefrom general rules for guidance in pedagogy. He draws a striking parallel between the effort of the will in the large scale, in history, and its exercise by the individual. The reasoning leads to the conclusion that personal responsibility follows directly from freedom of choice and constant exercise thereof on successively higher and higher planes.

*Education in Italy* (Chapter XVII, pp. 741-787).—In this paper, by Dr. Tullio de Suzzara-Verdi, K. C. I., the author points out the necessity of knowing the history of a country before estimating its progress in education, and the difficulty a young nation, with few obstacles to overcome, finds in appreciating the prejudices in the way of the reformer in an old country like Italy, which has been torn by wars and revolutions, and been subject to invasions and political dissensions for centuries. No other country presents such alternations from the highest position in science, art, and philosophy to one of intellectual subordination as Italy has experienced in her history. The modern spirit has, however, been felt in Italy and has aroused there, especially since 1870, the solicitude of patriotic statesmen for public instruction, with the result that education, formerly the privilege of the few, is now made compulsory for the many.

The education department of Italy is organized throughout the Kingdom under one head, the minister of education, who is a cabinet officer. The system is uniform, so that a student from one university or school would find his grade unchanged in any other in the Kingdom.

The minister proposes to Parliament laws relating to education and is the executive officer of these laws as well, issuing decrees and rules for the administration of the schools. Under him are prefects of provinces, who are general supervisors of the schools of the provinces, and superintendents and inspectors.

Since 1898 great attention has been paid to school hygiene, the reports of the inspectors at that time showing the utmost neglect of the most ordinary regard for hygiene in many communes. At present, however, in erecting new buildings or improving old ones, all the modern requirements of hygiene have been insisted upon.

As in France, the political administrative unit in Italy is the commune, which is the smallest division of land having a local government, the latter consisting of a mayor and a council, both elective. A province is a larger division of land comprising several communes. The governor of the province (prefetto) is appointed by the National Government. The commune and province perform the functions of public instruction in common.

Beginning at the lowest grade of instruction, in 1898-99 there were 3,205 kindergartens with an attendance of 346,887 (176,545 males and 170,292 females), a gain over the statistics of 1895-96 of 392 schools and 29,720 pupils. Of these schools 537 follow Froebel's method, 134 Aporti's, and 2,534 a combination of both. The funds for the support of these schools are derived from the State, the provinces, the communes, and from private and religious sources. The income from these sources in 1901 was \$1,469,553, and the expenditures for the schools \$1,374,061. The average attendance was about 108 pupils to a school, and the expense \$3.98 per pupil. Benevolent associations have been formed to assist the children of the very poor with school books, clothing, and food. Out of 8,260 communes 2,051 have adopted these infant schools, or 25 per cent of the whole number. The teachers numbered 7,370 (108 males, 7,262 females).

The primary school includes a course of five years of elementary studies, subdivided into two portions, one of three years, called the lower primary grade, in which attendance is obligatory upon every child over 6 years of age; the other, called the higher primary, is of two years and, while a continuation and progressive complement of the former, is not compulsory.

The course of studies in the primary grade includes Italian, practical arithmetic, rudiments of Italian history, geography, reading and writing, rights and duties of a citizen, the metric system, elementary gymnastics, and in rural districts elements of agriculture. The enrollment in the public schools was 2,444,288 (in a population of about 32,000,000) in 1898-99, against 2,379,349 in 1895-96. Including private schools, the number of primary schools in 1898-99 was 60,483, and of teachers 62,638. Enrollment (public and private) was 2,636,957. The effect of compulsory elementary education is shown by the decrease in illiteracy since 1871, when it was 73 per cent, against 42.92 per cent in 1898-99. In the latter year there were 220 complementary schools for girls, with an attendance of 7,459 pupils. These schools furnish instruction which is complementary to that given in the superior

primary and includes drawing, foreign languages, pedagogy, hygiene, and gymnastics. Graduates of these schools are fitted to enter the normal schools or take positions in the commercial or industrial world. There were 38 normal schools for males and 118 for females, with an attendance of 1,454 males and 20,034 females in 1898-99. The normal schools for males are decreasing rapidly, as it is generally conceded that the office of teacher in elementary schools is better adapted to women than men.

The communes are compelled by law to maintain elementary schools in number depending on the population. Besides, they contribute largely to the support of the kindergartens. In 1898-99 the communes expended for public elementary instruction of all kinds the sum of 66,302,966 lire, or \$12,796,472. This makes the annual expense for instruction for each pupil of the obligatory primary grade, paid by the communes, amount to \$5.25 (about 42 cents for each inhabitant of the Kingdom). Adding to this outlay by the communes the contribution from the provinces and the State, the total expense for public elementary instruction 1898-99 was 74,398,629 lire, or \$14,358,935. It is estimated that the total annual public expenditure for education, aggregating that of the communes, the provinces, and the national treasury, is about 115,000,000 lire, or nearly \$23,000,000.

Besides public instruction Italy is abundantly supplied with private schools, which are required by aristocratic tastes and are encouraged by the church.

Instruction in agriculture has taken a new start in Italy since the ministry of Dr. Guido Baccelli. Under his recommendations thousands of landed proprietors have given gratis small parcels of land to the schools for practical instruction in agriculture. This kind of instruction is given in the elementary rural schools, and teachers who have no practical knowledge of the subject are prepared to give the proper instruction by attending lectures by experts. In 1899, 1,802 such lectures were given to 15,000 teachers. Agriculture is taught also in the normal schools. This instruction is aside from that given in regular agricultural schools.

Industrial schools are under the charge of the minister of agriculture and commerce, and are supported by the communes, the provinces, and the State. There are industrial schools of art and trade in 58 cities, in which are taught the elements of science and technics applied to the various trades. There are also 12 inferior commercial schools, which prepare pupils for clerkships, minor mercantile pursuits, telegraph and railroad employment, etc., and 103 schools of art as applied to industries. There are, besides, 15 industrial and commercial schools for girls, in which handiwork suitable for females is taught.

Superior technical instruction is given in State technical institutes,

nautical institutes, and the universities. There were 37,900 students attending the Government and private technical schools in 1899-1900. This is exclusive of those pursuing the higher technical and scientific courses at the universities. Three thousand nine hundred of these pupils were females. There has been a gain in this department of study of 2,867 pupils since 1898-99.

These statistics show that technical instruction is coming more and more into favor and that Italy is sharing in the present universal movement in this direction.

In Italy secondary classical instruction is given in the *ginnasii* and *lycei*, the former having a course of five years, which is followed by a course in the latter of two years. The whole completes the preparation for the universities. The curriculum includes for the *ginnasii* Italian language and literature, Latin, history, geography, and arithmetic; and for the *lycei* the foregoing continued, with German or French, physics, natural history, and philosophy.

In 1900-1901 the attendance at the public Government institutions of this grade was 32,846 at the *ginnasii* (of whom 1,178 were females) and 13,270 at the *lycei* (287 females), making a total of 46,116. These figures represent only the State secondary classical schools, and would be greatly increased if the statistics for the private institutions of this class had been available. These statistics, nevertheless, show an increase of nearly 10,000 at the public secondary classical schools of Italy since 1895-96.

The attendance at the 22 universities in 1900-1901 was 23,425. It is interesting to note the attendance at the different faculties, as this indicates the current preferences of the students, which is doubtless largely influenced by the demands of the country. The attendance then was distributed among the various faculties as follows: Jurisprudence, 6,791; medicine and surgery, 6,211; mathematics (pure), 538; applied (engineering), 1,071; physics, 144; chemistry, 280; natural science, 473; engineering school, 200; letters and philosophy, 1,144; pharmacy, 3,528; notaries and solicitors, 806; midwifery, 1,202; veterinary surgery, 580; miscellaneous, 157; total, 23,425. To this should be added 2,621 students at the superior institutes, which have the programmes of universities, but are private. Altogether the author makes attendance of university grade 26,510 in 1900-1901, an increase of 694 over the previous year. Of this number 168 were female students taking studies of the university grade.

There are certain boarding schools (as we should call them) for girls, called *convitti*. In these institutions, which are survivals from former times, the young girls, who are under the tuition of nuns, are kept under the strictest surveillance. There are about 1,577 of these *convitti*, 760 of which are ecclesiastic, 262 partly lay and partly ecclesiastic, and only 555 are subject to governmental, provincial, or communal

control. About 53,000 young ladies attend these institutions annually. Of the 1,380 instructors only 470 were lay, the rest being nuns and priests. There were also 860 convitti for young men, with an attendance of 51,227.

The Italian Government pays attention to the education of its citizens in foreign countries, maintaining 52 royal schools of grades ranging from kindergartens to the liceo (one only of the latter grade) in foreign lands, at an expense of \$180,000.

Besides these Government schools it appears that Italians maintain elementary schools in the colonies which are supported by societies which originated them and by private contributions. There are 100 or more such schools. Some colonial schools are of very ancient date, having been established in various cities of the East long ago as a help in the work of evangelization, but they are now established in the South American Republics. They are subsidized by the Government or by the "Societa Nazionale."

It is the prevailing opinion in Italy that classical and university instruction is above the real wants of the country, while agricultural and industrial instruction is not sufficiently patronized and should be encouraged in every way by the Government and Parliament. Italy is preeminently an agricultural country; her exports are agricultural and her imports industrial, the balance of trade being against her, hence the necessity for increased attention to technical instruction.

A table showing the attendance at the different university faculties in 1893-94 and 1900-1901 shows an increase in law, mathematics, physical, natural, and chemical science, letters and philosophy, pharmacy, veterinary medicine, and "agrarian" studies, while there was a decrease in attendance in medicine and surgery, and engineering of all kinds.

An interesting institution is mentioned among the literary and other societies of Italy, called the "Dante Alighieri," the object of which is to foster and diffuse the Italian language and culture among the four or more millions of Italians who are under the sway of non-Italian powers (as in Trieste, Malta, and the Tyrol), or have emigrated to foreign lands; to oppose legitimate resistance to all attempts on the part of foreign states to suppress the Italian language and literature in the colonies or provinces under their dominion, and to establish Italian schools and libraries in the colonies and foreign countries. This society is supported by all classes of Italians, from the King and court to the humblest subject, and has spread all over the Kingdom. It was organized in 1890, and now 60 committees within the Kingdom and 22 out of it are carrying out the patriotic programme of the society.

In an article prepared for this Report (Chapter XVII) by Prof. Alexander Oldrini on the Reform of the University and Higher Education in Italy in the debates before the Italian Parliament between

1883 and 1899, the author points out the vast intellectual influence of the populous Italian universities of the Middle Ages, their importance for intellectual freedom, and their share in producing the renaissance in the fifteenth and sixteenth centuries. Italian universities have had a continuous existence for eight hundred years, and their influence in keeping alive letters and civilization in the midst of barbarous surroundings was referred to in the debates upon their proposed reform.

Immediately after Solferino no problem appeared more important or meritorious to Italian statesmen than that of public education, owing to the degraded condition of the masses, the result of centuries of denationalization and ignorance. A general law, known as the Casati law, was accordingly passed in 1859, which has been called the educational code of modern Italy. Soon after, in 1862, began the series of debates and parliamentary reports, lasting thirty-five years, on university and higher education, which culminated in the Baccelli bill of 1898. The participators in the debates seem to have shown with remarkable unanimity their desire to infuse modern ideas and methods into Italian higher education, and place the universities abreast of those of the best of Europe, and make them leaders of the freed nation in the path of progress. The full results of these efforts were not made possible until after the unification of Italy in 1870. There was, however, less unanimity as to the means of accomplishing this result. The advocates of reform finally became divided into two parties, those in favor of freeing the universities from all state control and making them autonomous, and those who believed it necessary to retain them under government control, at least temporarily. Some wished to reduce the number of institutions, while others maintained that their usefulness as centers of influence would be impaired by any reduction. In discussions on the curriculum and freedom of teaching and studying, academic liberty—once the glory of the old Italian universities, as now of the German—was insisted on; enlargement of the scientific and technical courses and other modernizing improvements were debated and advocated with full information of the methods of the modern university. Among other matters, it is interesting and significant to note that Dr. Baccelli recommended earnestly self-government and self-discipline of the students. This practice would give the student corps, he argued, the sense of responsibility which free men take upon themselves when freedom is the basis of their action. The following is a summary of some of the articles of the education bill of 1898:

The Baccelli bill provides in Article I for the autonomy of the Royal universities and institutes of superior education under the supervision of the Government.

Article IV provides for the government of the institutions by a committee composed of the rector and representatives of the faculties

and a representative of the Government. Estimates to be approved by the minister of public instruction. Persons or corporations contributing to the resources of the institutions to the extent of one-tenth of the Government allowance shall be entitled to representation on the executive committee.

Article V. Faculties of universities and schools of higher education have the right to propose to the minister the appointment of professors.

Article VI provides for conferring diplomas by the universities and granting professional licenses thereupon by the Government.

Article VII provides for equalizing the programmes of private and Government instruction, authorizes independent (private) teachers to sit on examining boards, and declares that independent professors are to be preferred to Government professors in competition for university chairs.

Article IX provides for the abolishing of faculties when insufficiently attended.

Article X provides that all independent universities offering the scientific guaranties required by law shall be entitled, by royal decree, to the same rights as the State universities.

*Illiteracy of the voting population* (Chap. XVIII, pp. 789-818).—A study of the illiteracy of male persons of voting age (that is, 21 years and upward), based on the returns of the Federal census of 1900, was made recently for the bureau of investigation of the Southern Education Board; the results arrived at, as well as the material itself, will be found useful for reference, particularly in discussions relating to the right of suffrage, and I have therefore included them in Chapter XVIII.

Marked progress has been made in the reduction of illiteracy in the last three decades. From 1870 to 1900 the illiteracy of white males of voting age was reduced from 9 to 6.6 per cent, and of negro males of the same age from 83.5 to 47.4 per cent, the percentage in the latter case not being much more than one-half of what it was in 1870. As the bulk of the negro population is found in the South, the decrease testifies to the effectiveness of the public-school systems of the Southern States, but not in the degree in which it would, however, if the older negroes who were beyond the school age in 1870 had been eliminated.

Among the white voting population (whose average illiteracy is 6.6 per cent) the foreign born are most illiterate, their percentage being 11.5; the native born of native parents have 5.9 per cent, and the native born of foreign parents only 2 per cent. This small illiteracy of the sons of immigrants is general, being observable in every one of the five geographical divisions as a whole, though in each of the five New England States taken separately the sons of natives have by far the smallest illiteracy. These results are similar to those of the census of 1890.

In Chapter XIX (pp. 819-836) the customary list of foreign higher seats of learning is given with a number of new institutions inserted. Perhaps the most noteworthy fact presented in this list is that in attendance the university of Berlin has overtaken that of Paris. It enrolled in 1902 13,070 students, while Paris enrolled 12,171. In the list of polytechnica Berlin is also the first, with 4,811 students; so also in the list of agricultural and veterinary colleges Berlin is at the head, with 684 and 483 students, respectively. But in art schools Paris leads all other countries, having an attendance of 2,000.

*Commercial schools in Switzerland.*—Chapter XX (pp. 837-855) contains an account of the commercial schools of Switzerland, in which the history of business education in that country is traced to its beginning in the Middle Ages. It is not at all astonishing to observe similarity in the growth in all educational agencies throughout central Europe, the nations not being so sharply differentiated formerly as they are now. The present status of commercial education in Switzerland appears to be very satisfactory. That Republic had in 1900 27 public commercial secondary schools, with 1,800 students and 300 students of special branches. Some of these schools are of a high order; for instance, those of Zurich, Bellinzona, St. Gall, and Geneva. There are also 59 elementary commercial (evening) schools, with 5,244 students. While all these schools receive annual appropriations from the federal treasury, some are chiefly supported by the State (cantonal) governments, and a number are private institutions receiving subsidies. A characteristic feature of all these institutions is that they have in their courses of study certain so-called culture studies; that is to say, that they insist upon a general education preceding or accompanying the specific commercial training. The Swiss authorities make the subsidies they grant dependent in part upon this condition, cognizant of the truth that specialization always implies limitation; hence the Swiss authorities bestow much attention upon linguistic study in their schools.

Chapter XXI (pp. 857-885) contains consular reports which are printed here by courtesy of the State Department. Among these statements there are two on commercial education in Germany, one on a commercial school in transcaucasian Russia, and several referring to special schools, such as the weaving school at Glauchau, Germany, and the industrial school at Tourcoing, France.

*Henry Barnard.*—Chapter XXII (pp. 887-926) passes in review the distinguished services rendered by Henry Barnard to the cause of public instruction in this country, services which, by reason both of their character and their far-reaching influence, have a truly national importance. The record covers an extended period, beginning with the initial effort of Dr. Barnard in behalf of educational reform in Connecticut and continuing without interruption up to his death,

which occurred in 1900. The chapter comprises a review of his special services to education in Connecticut, as set forth in an address delivered at the celebration of Dr. Barnard's eighty-sixth birthday, in 1897, and extended accounts from different sources of his relation to the Bureau of Education.

Dr. Barnard's work in Connecticut and Rhode Island corresponds in time and in purpose with that of Horace Mann in Massachusetts. Their names are, indeed, inseparably associated in the movement which determined for all time the essential features of public systems of education throughout our country.

The work of Dr. Barnard in initiating practical reforms in education was supplemented by that of collecting in one great body the written records, not only of this movement, but of all similar movements in the history of mankind, and it is as an untiring collector and publisher of information pertaining to the interest which absorbed his attention that his fame has spread to all civilized nations. His enthusiasm for this particular line of research naturally directed his mind to the importance of some central clearing house of educational information, and he seems to have been the first person to publicly suggest such an agency.

His name is identified with all the preliminary measures that led eventually to the establishment of the National Bureau of Education, and he naturally received the appointment of Commissioner immediately upon its creation. During his three years incumbency of this office he rendered invaluable service by outlining a comprehensive scheme of inquiry which has to some extent guided the work of the office ever since, and also by the collection of important material respecting education in the District of Columbia and the legal status of the colored population in that District and in 14 States, which formed the bulk of a special report published by order of Congress.

Dr. Barnard's "monumental work," observes General Eaton, who succeeded him as Commissioner of Education, "was his *Journal of Education*." This publication, to which he devoted his fortune and the most arduous efforts, is universally valued as a reference book and represented in this country the first systematic effort to foster the comparative study of educational systems and movements. His plans for this publication were carefully elaborated and formed the basis of his suggestions as to the scope and operations of the Bureau of Education. (See pp. 923, 924.)

Fortunately it has been possible to collect very full particulars of the work actually done by Dr. Barnard, and of the spirit and purposes which animated him, from persons who were more or less intimately associated with him during the whole period of his active life. Great care has been taken, so far as possible, to verify by published documents and concurrent testimony the details presented in

this chapter. Hence the matter is a valuable contribution to the permanent educational history of this important period.

*Length of college course* (Chapter XXIII, pp. 927-948).—The subject of the length of the college course has been much discussed during the year among college men, especially among executive officers, and the interest aroused in the subject has led to the incorporation in this chapter of the action taken by some of the institutions toward reducing the time requirement for the bachelor's degree, together with a reprint of some of the discussions and a comparative statement showing the advance in admission requirements at Harvard University from 1642 to the present time.

*Oxford University and the Rhodes scholarships* (Chapter XXIV, pp. 949-999).—The past year is in some respects memorable on account of the publication of the provisions made for free scholarships at Oxford for the benefit of colonial and American students. I have pointed out in an article reprinted here some of the special advantages which an Oxford life has for American students there, and I have indicated some of the points of relation between the endowments (not only of Mr. Rhodes, but of our American millionaires) for education and the necessity thereby created for a larger representation of America in the universities of Europe, with a view to furnish a quota of our population who understand, through the intimacies of a student life, the characters and modes of life of the governing classes in the great nations of Europe.

*Education in Great Britain and Ireland* (Chapter XXV, pp. 1001-1068).—The current record of education in Great Britain and Ireland possesses unusual interest for the student of education because of the passage of the new education law (law of December 18, 1902). This measure presents a singular mixture of reactionary and progressive tendencies, which can only be understood by comparison with the earlier law of 1870. The conditions that gave rise to that measure are briefly summarized in the chapter before us. It is enough to recall here that, while conserving the work already accomplished by denominational effort, it placed upon civic authorities the responsibility for completing the school provision of the country. To this end the law provided for the election of school boards in every district of England in which school provision was shown to be deficient. These boards were authorized to establish schools, borrowing money for building purposes on the security of local property taxes, and levying a school tax for the current expenditures of the schools. The government appropriation for elementary education which, beginning in 1833 with a grant of £20,000 (\$100,000), had reached in 1870 a total of more than £560,000 (\$2,800,000) was to be continued and distributed to both board and denominational schools on the same conditions. In other words, the law of 1870 provided for a dual school system comprising

board schools, i. e., public secular schools comparable to those of the United States, and denominational schools, henceforth termed "voluntary," under church or other private managers.

The remarkable development that has taken place under the law of 1870 will be seen by reference to the retrospective tables. Whereas in 1870 there was school accommodation for only  $8\frac{1}{2}$  per cent of the total population, in 1902 the accommodation in schools recognized by the Government as efficient was adequate for  $20\frac{1}{2}$  per cent. The increased efficiency of the schools is indicated by the advancing ratio of average attendance to enrollment, i. e., from 68 per cent in 1870 to 81 per cent in 1902, and by the increased proportion of adult teachers. The standard of elementary education has also steadily risen, as shown by the increasing number of pupils taking subjects above the three rudiments (Table XIV, p. 1011). The most impressive fact brought to light by this review is the growth of the board schools. Since 1870 these schools have made provision for 45 per cent of the school population, and in 1902 enrolled nearly 48 per cent of all the children in elementary schools. Meanwhile the Church of England schools, which far exceed the combined strength of all other classes of "voluntary" schools, have steadily multiplied, and in the last year named had accommodation for 42 per cent of the school population and enrolled  $39\frac{1}{2}$  per cent of all pupils. The annual expenditure for this work has proportionately increased. In board schools it has more than doubled, and in "voluntary" schools nearly doubled. If capital expenditure be included, the increase is very much greater, the total amount expended in 1895 being nearly six times that in 1871 (see Table VI, p. 1007). As regards the Government grant, it is noticeable that in 1902 the Church of England schools received from this source a sum but little below that appropriated to the board schools (Table 9, Division B). The increase in the local school taxes (for board schools only), i. e., from £71,000 in 1871 to £6,300,000 in 1902, is a striking proof of the local interest and support which the school boards have evoked, and hence appears to be the most important outcome of the law of 1870.

By the new law, the text of which is cited in full, the school boards that have achieved such great results in England are abolished and the local authority for education transferred to county and city councils. These councils, like the boards, are popularly elected bodies, but on account of their multiform duties it is manifestly impossible that they should give direct attention to these new and important duties. Therefore they are authorized to establish educational committees, to whom they may delegate their powers under this law, save only the power of raising money by tax or loan. Furthermore, the public elementary schools provided by the local authorities will be directly under a body of managers appointed by the local authorities.

Thus it will be seen that the people are only indirectly represented in the management of their schools and are likely to lose that vital interest which was fostered under the school-board régime. Moreover, while providing for the support of church schools from local taxes, the law has materially strengthened ecclesiastical control of education, which is a policy in direct opposition to that of civic, nonsectarian control, toward which modern movements have tended. As originally drafted the bill made no provision for civil control of the church schools, but under the intense opposition excited by this endeavor to apply local taxes without public control an amendment was carried providing that two out of every six managers shall be appointed by local civic authorities. It was subsequently provided by the now famous Kenyon-Slaney amendment that the religious instruction given in these schools should be under the control of the managers. As a consequence of this amendment, religious instruction has virtually been brought under civic supervision. Thus the very slight concession to the determined advocates of public control over public moneys has resulted in a radical modification of the original terms of the law. This unexpected change has excited an opposition in the church party almost as intense as was manifested by the Nonconformists to the proposition that they should be taxed for denominational instruction opposed to their conscientious convictions. As it stands, therefore, the new law, although avowedly intended to unify the local control of education, seems to have intensified the elements of difference. The full significance of these unexpected provisions of the law as regards church schools is disclosed in an article by an English writer entitled "The clergy and the education act," which is included in this chapter. The complicated administrative system that has resulted from the proposed effort at simplification was exposed by Mr. James Bryce, M. P., the leader of the opposition in the House, in a speech which is also cited (p. 1026).

Apart from the provisions here discussed the law has made valuable contribution to the movement for unifying and extending the national system of education. The local authority which it sets up is empowered to make due provision for education above the elementary grade, corresponding in general to what is termed secondary education in the United States, and thus for the first time in the history of England all education below the university province has been dealt with in a comprehensive manner. Moreover, the new financial provisions put an end to that inequality between board and church schools which had become a serious evil. These favorable aspects of the bill are set forth briefly but lucidly in an extract from the London Times, entitled "The national aspect of the education bill" (pp. 1027-1028).

The final test of the measure will be found in the spirit in which its provisions are carried out by the county and city councils. There are

already evidences that, at least in the great cities, it will be administered in a spirit of fairness and with due regard to popular demands. This final test of the law is very fully elaborated in an article by Dr. Macnamara, M. P., entitled "The new education act at work," also cited in this chapter.

London is not included in the operations of the law, but a separate bill dealing with the metropolis has been introduced into the House of Commons. This bill follows in the main the policy of the general law. As first drawn, however, the London county council, a very progressive body, was made subordinate to the borough councils, which are the successors of the former vestries. This proposal to curtail the authority of the county council excited such a storm of indignation that it was withdrawn after it had passed the second reading in the House by an immense majority.

In view of the provisions of the new law with respect to secondary education the chapter includes a historical survey of measures relating to this province which, beginning in the early part of the last century, have been steadily tending toward increase in the number of secondary schools, variation in type, and some system of unified control or supervision. In respect to this province Scotland enjoys peculiar pre-eminence in the Kingdom. Its elementary and secondary schools are alike managed by local elected school boards, and there is no marked line of distinction between the two grades. In view of a proposed new education law for Scotland, concerted action is being taken to preserve this traditional unity.

No complete statistics of secondary education in England have ever been collected, but such statistics as are available have been brought together in the chapter here considered. The view of this important province is completed by programmes of typical secondary schools.

Under the head of higher education in Great Britain and Ireland the chapter presents tabulated statistics of universities and university colleges, and a brief summary of the most important recent events relating to this department of education. The extension of the sphere of university activity is one of the most significant facts in the recent history of the country. Oxford and Cambridge have greatly increased their influence over secondary education by their system of examinations for secondary schools, and have gained a certain influence over the artisan classes by a vigorous work of university extension. The recent reorganization of London University has given to that city a great teaching university. The university colleges recently established in the great centers of industry show progress both in resources and patronage. The Scottish universities are moving for the reorganization of their curricula—an action evidently stimulated by the Carnegie bequest, the disbursements from which for the present year

are given in detail. The urgent demand for a Roman Catholic university for Ireland led to the appointment of a royal commission to deal with the whole problem of university education in that division of the Kingdom. The report of this commission has just been issued, and on account both of its scope and judicial tone the hope is expressed that its recommendations will lead to a satisfactory settlement of the problem which has engaged its attention. The chapter closes with the citation from an article in *Nature* which discusses certain phases of university life in Great Britain as compared with Germany and the United States. The author admits that the conditions are too dissimilar in the different countries for exact comparisons; they are valuable rather for the facts they disclose than for relations which they establish. On the basis implied it appears that the United Kingdom has  $4\frac{9}{10}$  university students for every 10,000 of the population, as against  $7\frac{8}{10}$  in the German Empire and  $12\frac{1}{10}$  in the United States.

*The educational problem in England.*—Properly to conceive the situation in England one must think all the social elements as existing in a state of tension, namely, each popular interest in Great Britain as existing in a constant struggle with all the other elements for its due consideration in the aggregate of all national interests. The manufacturing population, its capitalists and its laborers, the agricultural population, its landowners, and its gentlemen farmers who lease the lands, and the masses of people who perform the common labor, added to those who manage its commerce, capitalists, supervisors, and laborers in the shops and markets, and engaged in transportation, and besides these, the titled classes of gentlemen who live upon their incomes from the land—and count with these the ecclesiastics, those engaged in governmental service, the civil list, and the army and the navy, and add whatever other classes there may be—each pushes according to its strength and according to its particular interest, and the resultant is a balance of forces, an aggregate result, not the choice of any one party, nor the victory of any person or party, because the result is a compromise made which represents all the forces, each force limited through all the other forces. The aristocracy strives to retain its power and to get all that it can from the other classes. The mercantile population, the transportation population, the church, the farm laborers, and the manufacturing population all strive each to get its own, and to get the highest amount of well-being for its expenditure of strength and material means. This struggle reminds one of the principle in evolution known as the survival of the fittest. It seems to be a selfish struggle for the possession of means and power, each class against all the other classes, the strongest getting the lion's share and the weakest getting a pitiful morsel only, not sufficient for the food, clothing, and shelter demanded for a rational life. But this

cruel and unfeeling struggle for survival is supplemented by the national philanthropy which ekes out the stipend of the lower and lowest ranks of society by the poor rates collected for the support of the paupers and for occasional aid for those members of the ranks above the paupers who fall into circumstances of special need.

It is said in behalf of the existence of the grand struggle that it develops individual strength as nothing else can do, and as regards the people who get underneath in the struggle it is said that the church and the state look after their actual needs of subsistence; and on the whole there is a development of individuality such as could not be expected under a different organization of society. "Every people will have weaklings, who must be in a measure supervised and cared for by the rest of society, just as the children in the family must be more or less guided and provided for by their parents and the older members of the family."

To some persons this explanation seems a forced one, designed specially to justify what is called the competitive organization of society. To others, and especially those engaged in the social philanthropies, it seems inadequate.

This competitive struggle exasperates the student who is a partisan (for he takes sides with one party and does not feel a tolerant spirit toward the others), and it seems to him tyrannical that his favorites should get no show.

But English fair play means just this thing—the free contest of all and the aggregate result in which is represented at its full force, each force reduced to its true value as measured by its ratio in the strength of the whole.

There are castes founded on conquest long ago and on wealth inherited from remote ancestors: but there are new conquests in war and new heroes, and layers of new castes, and especially new strong people, continually arising through acquired wealth, through inventions, through new industries, new conquests in distant border lands. The captains of industry, the organizers of capital, all those who make combinations in transportation and invest in distant lands capital for public improvements, form a large class in the ranks of the new higher caste.

But an estimate that counts only the total process of the struggle of each might against the whole gets only a half of the elements of the problem.

There is besides this struggle the philanthropy that comes to the help of the weaklings of society, with hygiene at public expense, with alms distributed for the paupers, asylums for orphans, feeble-minded, and defectives, and with juvenile reformatories for reprobate children.

It is this curious make-up from two contradictory elements—the cruel collision of brute force and the tender-hearted philanthropy—

that puzzles students from other nationalities. It is difficult to see both sides at once. At one view it is a heartless struggle for control, each one for itself and no consideration for the others. Then, at another view, Great Britain is the nation of all in the world for the benevolent consideration of the "under dog."

*The caste feeling as affecting English education.*—In no particular perhaps is the English ideal more different from the American than in the fact that the caste system demands an habitual feeling of the necessity of restraint within one's sphere of life. It demands content and a cheerful acceptance of one's lot in life—the determination to do faithfully the duties involved in one's sphere. The American life and education go toward the creation of enterprise and a heart hunger for adventure. This, too, is the spirit of English literature, from Defoe's Robinson Crusoe or even Spenser's Fæerie Queene down to Kipling's latest poems and stories.

In this we see, in some of its phases, what it is to have an established church. Such a church belongs to a caste system in which the orders of the population are fixed by the constitution, whether written or traditional. All Europe, in fact, separates its orders by hard and fast lines as compared with the United States and Anglo-Saxon colonies. The established church teaches this acceptance of one's lot in life as predetermined by heredity and accident. A settled conviction arises in the mind of the English citizen that it is for him to know his duty and perform it as prescribed by the functions of his caste. He has duties to those above him in the social rank and to those below him. He performs these duties and exacts, as far as he is able, a similar performance from others. His superiors should behave toward him with paternal condescension and humanity and his inferiors should perform their duties toward him with some trace of filial consideration.

It is difficult for people in the United States to conceive the true inward attitude of mind on the part of the inhabitant of Great Britain. It is somewhat difficult even for a Canadian or Australian to conceive the state of mind of English peasantry in the rural districts of England. Large opportunities wait on all individuals in the colonies, and limitation comes only from within, not from without in the form of social caste. But the grandfathers now living in the United States can remember hearing their grandfathers tell of the deference paid in the town to the squire and his family and to petty dignitaries of the kind. In colonial times it was in many places customary for the congregation to rise and remain standing while the squire with his family moved down the aisle and took his front seat in the church. The view of the world of the person who recognizes caste and feels it as an ordinance founded in the nature of things, compared with the view of the world of the person who is brought up to believe all social distinctions acci-

dents not affecting the fundamental rights of freedom and equality before the law of each individual, explains for us the radical difference which the Declaration of Independence has in the course of three generations produced in public and private opinion in this country. The continual readjustment of public opinion, rendered necessary by the Declaration of Independence and its doctrine of freedom and equality of all men in the substance of their humanity, has progressed so far in this time that the old view of fixed orders of rank in society, as defined by the written or unwritten constitution of the nation and as justified by the religion of the established church, seems impossible to a rational being. It looks to us as though it were possible only to a people with some moral obliquity in their view of the world. The equality of all has become a political axiom with us. And yet the thoughtful person will readily admit that the world at large outside of the United States has not arrived at this conviction. The citizen of the United States, however, is in the habit of supposing that his view of freedom must be the internal or private opinion of every human being on the planet, however different may be the practice. It is only, he says to himself, the practice that has not yet come up to the theory. But those who have made a careful study of the philosophy of history and of the comparative psychology of nations have come to see that the difference lies deeply in the political conviction of peoples and not merely in their practice.

I have dwelt on this point because the people of Great Britain come so near taking our political point of view that we are unable to explain their difference in practice.

We are just coming by means of animal psychology to understand in the case of bees and ants the rise of separate social orders and a fundamental instinct that determines the vocation of the life of the individual, limiting it to special functions, as in the case of laborers, drones, queens, etc. We are on the way to understand tribal life and the substantiality which caste based on heredity attains. By and by, perhaps, we shall see and understand all the degrees of emancipation from caste which the nations of farther Asia, the Chinese, and the East Indian civilizations have made on the way from savagery. These nations of farther Asia seem on a superficial view to have reached the acme of the caste idea. But they have achieved a great emancipation as compared with savage life, wherein nature rules with absolute sway. It is a great step when human nature gets reflected in literature and also in codes of customs and laws like those of Confucius and Mencius in China, or in the East Indian "code of Manu," for mere use and wont without reflection is mechanical as compared with a use and wont which is contrasted step by step with its ideal in literature, because the individual employs in this operation of comparing his deeds with its ideal a vast amount of self-activity.

Assuming the point of view of our declaration of independence, the establishment of a caste system and of divine rights founded on hereditary descent or the accident of history, seems like a struggle of selfishness to obtain unwarranted power.

On the other hand, setting aside this American view and approaching the study of the institutions of Great Britain from the standpoint of comparative history, we are filled with admiration for the devices invented by the unconscious spirit of the people to make the higher ranks, the hereditary nobility, and the possession of wealth founded on monopolies serve the lower ranks of the people. From this it looks as if the higher ranks had for their chief function the creation of opportunity for the lower ranks. The uneducated peasantry are more or less in the condition of "the man with the hoe," and contented with a lot in life which demands only a minimum of directive power. But the British East India Company creates opportunities for wealth and competence for hundreds of thousands of this stratum of the home population. It elevates them and their families into castes many degrees higher than those filled at home. And so the governing caste of Great Britain take possession of Australia, New Zealand, South Africa, and Canada, with no end of expenditure of wealth and of military power, all for the creation of opportunity for the average common citizen. When it is asked what the highest classes of people in England do, history answers with the details of British colonization by which the ranks of the poor and scantily educated castes of its people under the leadership of members of the aristocracy have planted civilization and nurtured it in all quarters of the world—and one may say the record of the growth of the United States and of its prosperity belongs to this part of British history.

But the possession and colonization of territory is not the only exhibit which history makes of the united force of the British Empire; there is another sphere which belongs to what may be called promotion or the capitalizing of foreign industrial enterprises, such as the building of reservoirs for cities, transcontinental railways, naval vessels, steamboats for river navigation, the improvement of harbors, the building of sewers, and all that class of operations which invests capital in internal improvements in advance of the power of the borderland nation to provide the capital for building them out of its own income. The borderland nation can not spare the capital to provide what is necessary for its own hygiene and good government, namely, pure water, electricity or gas for its illumination, and street railways for the cheap transportation of its population, but it can afford to pay a good rate of interest on capital thus invested. The small sum that is necessary to furnish a hundred gallons of pure water a day for each inhabitant can be afforded by the poorest of populations when paid in the form of water rates, which in the aggregate pay the interest on

the bonds which paid for the waterworks. The actual cost of sinking wells or the actual labor of bringing the water in buckets from a muddy river is an immensely greater tax measured in terms of money or daily labor. Builders of works of public hygiene make it possible to begin now to stamp out fever and pestilence and those dangers to public health to such a degree as to reduce the death rate to half its normal standard under conditions prevailing in the eighteenth century—a generation earlier than would be possible were the enterprise left to the borderland people. English capital, prompted by a prudent philanthropy, has reduced the death rate of London to the annual average of 20 deaths in each 1,000 of the population.

The estimate of the annual income from capital invested outside of Great Britain exceeds half a billion of dollars, or \$12 apiece for each man, woman, and child in Great Britain and Ireland. These investments in financial undertakings in all parts of the world carry with them opportunity not only for the lower ranks of the British population, but also for all ranks of people in the countries benefited by these outlays of capital.

*The Established Church as an educational power in England.*—The English act appropriating £30,000 for education, was passed in 1838 about the time Horace Mann was beginning his gigantic efforts for the improvement of the common schools of Massachusetts. The church had in charge the education of the English people up to this time, and it was the church in all countries that had looked after education through the centuries up to the time that Frederick the Great first moved in the matter of people's schools. In England, as, indeed, in all European countries, the idea of caste is firmly established. Education seeks to adapt the individual for his station in life. Each caste seeks to establish its class privileges and defend itself against the castes above and the castes below it. But from the beginning the church has trained for its sacred offices men from the lowest ranks equally with the highest, and persons of the humblest birth have been able to mount to the highest ecclesiastical places. This is the democracy of the church. But this is more characteristic of the Catholic Church than of the English Established Church. While the firstborn of the nobility and of the gentry inherit the rank, titles, and wealth of their station, the younger brothers find places in the army or positions in the Government at home or abroad, and many of the younger sons enter the church. The endowments of the church have come in past times from those who owned the wealth of Great Britain, and the livings created by these endowments go mostly to younger sons and younger branches of the aristocratic families. This is the aristocracy of the church.

While the Established Church is sacred and treated with deference, having its adequate representation in the Upper House of Parliament,

the dissenters are tolerated merely, but not tolerated because of their deserts and the respectability of their cause, but by reason of the strength which they show politically. As they have to be reckoned with, they command a certain degree of tolerance and respect. But as to his cause the dissenter is regarded by official respectability as not only in error but as in some degree sinful and as manifesting a reprobate perverseness which he has to answer for in the sight of Heaven.

There is progress from age to age in this matter of toleration, but it is slow; indeed, it appears exasperatingly slow to the dissenters themselves in England and to people of the same views residing in the British colonies or in the United States.

The English Church furnished the old education according to caste, teaching to each child the manners and aspirations to fit him for his caste, teaching to everyone the Christian view of the world and appealing powerfully to the religious sense of all by its ritual, its music, and its solemn festivals and significant ceremonial. The church education in religion and manners was so important that the proposed secular school education in arithmetic, geography, history, reading and writing, and in the select specimens from the richest literature in the world did not seem to have any attraction for the majority of the nation. The school education proposed was looked upon as a godless education, not needed by the lower castes, a barren intellectual repast, not to be compared with the education given by the church in religious duties and the catechism.

Meanwhile science has arisen in the opposite camp, the camp of the dissenters, and has attacked the basis of all this teaching, beautiful as it is, given by the church.

Free thought or investigation has invented what it is pleased to call "the higher criticism" and has attacked the doctrine of the inspiration of the Bible. The force of Bible language and of Bible modes of viewing the world when they are set apart and consecrated, as it were, for the use of the church has been and is one of the most important "evidences of Christianity." But all this is very much weakened when the Bible is reduced to the common order of secular experience, for it deprives the church of its chief instrument in addressing the religious sense.

Natural science and philology come as reinforcements to the dissenter in England who attacks the church as the possessor of the sole right to the education of the people.

This explains the educational struggles that have gone on for more than half a century in England. It has been the struggle on the one hand of the dissenters, who are especially numerous in cities, to get the control of their own schools, and on the other hand the struggle of the Established Church, with all the prestige it has, to hold secure possession of its inestimable right of educating the entire people in its parochial schools.

In other countries of Europe there come violent upheavals of public opinion, cataclysms which shatter the defenses of time-honored authority and prestige. These upheavals are more or less modeled on the French Revolution. But in England there are no revolutions of this kind, for the conservative forces yield slowly to the pressure when it becomes irresistible and manage to bring forward the reform measures contended for by the opposite camp. The new reform measures are thus administered by the conservative parties, who manage in this way to retain control. It follows as a matter of course that the victory gained becomes more or less of a defeat in the subsequent administration of the reform.

Hence there are no Waterloo defeats in Great Britain. The contest is settled step by step with such small advances and such modifications as arise from yielding on both sides what seems to be least important or too extreme to command a political majority of votes—in the parish, in the county, in the city, or in Parliament. The church will hold its own, but it will do it by permitting and acknowledging from time to time a triumph of the opposing party and then converting to its purpose the new measure as much as possible by compromise.

Perhaps the most important instrumentality of the conservative classes in Great Britain is their constant effort to proselyte to their way of thinking the fringe of the dissenting party that can be converted to Toryism. The old and established order wields great power to attract and captivate by personal attentions and social recognition the rising young men of the commons, and the education of the youth of all well-to-do people at Oxford and Cambridge conduces to the same result.

*Correspondence schools* (Chapter XXVI).—The first regularly organized system of correspondence instruction in the United States appears to have been that of Chautauqua, dating from about the year 1880. It had its origin in the desire of the students of the Chautauqua Summer School, particularly the students of foreign languages, to continue their studies at their homes after they and their instructors had dispersed at the close of the summer session. For this purpose graded series of lessons in each subject were prepared, which were mailed periodically by the teachers to the pupils, who in their turn sent back in due course their exercises or recitation papers for examination. This work grew in volume until it led to the incorporation of the Chautauqua University in 1883, an institution empowered to grant degrees, though all of the work of the students was done by correspondence, except in the case of those who passed a few weeks of the summer at Chautauqua in personal contact with the teachers.

The correspondence work of Chautauqua University was never profitable financially, and was discontinued in 1900. In the meantime, however, the method had been adopted by a number of colleges and

other institutions to meet the case of students who were not able to pass in residence the full period necessary for obtaining a degree; and the fact that certain well-defined portions of the work were permitted to be done by correspondence made a college degree possible to many worthy and aspiring students who would have been otherwise unable to obtain it. A noteworthy example of this class of institutions is the University of Chicago, which offers a great variety of correspondence courses. These courses are hedged about with all the conditions requisite to insure careful and thorough work. It is the opinion of President Harper that the best students do even better work in some subjects by correspondence than in the class room, though the institution requires every candidate for a degree to spend at least one year in resident study and secure a certain number of credits for resident work. Many details regarding the correspondence courses at Chicago University are given on pages 1080-1090.

But correspondence instruction has received its greatest development in the form of private schools employing solely this method of teaching, particularly schools preparing for special occupations. It has been found that such schools may be conducted so as to be profitable business ventures, and they have accordingly multiplied on every hand in recent years. Their students are drawn largely from the ranks of young persons engaged in active employment as clerks, apprentices in various trades and industries, etc., who desire to prepare themselves for higher positions in the line of their actual occupations or for some more remunerative calling. That the number of such aspiring youths is very large is shown by the success which these schools have met with. Doubtless many who would have remained in the lower ranks in the commercial and industrial world have been stimulated by the promises and inducements held out by these schools to prepare themselves for higher positions.

It is probable that some of the numerous "correspondence schools" advertised in the periodicals of the day, and professing to teach a multitude of arts and sciences, do not or can not fulfill the promises so alluringly held out. The financial profit that has been shown to be possible in conducting this class of schools has attracted a following of incompetent imitators, and apparently even of unprincipled adventurers, who have engaged in this form of business solely for the purpose of gathering in a harvest of students' fees, rendering in return only some nominal service, such as sending a few pages of printed matter of insignificant value. A knowledge that such impositions are practiced should suggest caution and discrimination on the part of those who contemplate taking a course of correspondence instruction.

*Universities, colleges, and schools of technology.*—Chapter XXXV gives the statistics of 638 universities, colleges, and schools of technology. Of the total number of institutions, 131 admit women only,

150 admit only men to the undergraduate departments, while 357 are open to both men and women. Omitting the students included in Division B of the table of colleges for women, there were enrolled in the remaining 520 institutions 107,391 students in undergraduate and resident graduate departments, an increase of 4,040 students over the number for the preceding year. The number of such students from 1889-90 to 1901-2 is as follows:

*Number of undergraduate and resident graduate students in universities, colleges, and schools of technology, from 1889-90 to 1901-2.*

Year.	Universities and colleges for men and for both sexes.		Colleges for women, Division A.	Schools of technology.		Total number.	
	Men.	Women.	Women.	Men.	Women.	Men.	Women.
1889-90.....	33,056	8,075	1,979	6,870	707	44,926	10,761

1892-93.....	46,689	11,489	3,198	8,616	843	55,305	15,530
1893-94.....	50,297	13,144	3,578	9,517	1,376	59,814	18,098
1894-95.....	52,586	14,298	3,667	9,467	1,106	62,053	19,071
1895-96.....	56,556	16,746	3,910	8,587	1,065	65,143	21,721
1896-97.....	55,755	16,536	3,913	8,907	1,094	64,662	21,543
1897-98.....	58,407	17,765	4,416	8,611	1,289	67,018	23,470
1898-99.....	58,467	18,948	4,593	9,038	1,339	67,505	24,880
1899-1900.....	61,812	20,452	4,872	10,347	1,440	72,159	26,764
1900-1901.....	65,069	21,468	5,260	10,402	1,151	75,472	27,879
1901-2.....	66,325	22,507	5,549	11,808	1,202	78,133	29,258

The value of all property of these institutions is reported as \$417,205,234, of which amount \$185,944,663 are reported as endowment funds. An analysis of the statistics concerning endowments shows that of 464 universities and colleges for men and for both sexes 147 have no endowment funds and must depend entirely upon students' fees and voluntary contributions for their support, while 141 others have endowments of less than \$100,000 each. The benefactions for the year amounted to \$17,039,967.

In this chapter is given a compilation showing the composition, methods of selection, and tenure of office of the governing boards of State institutions. In several States, namely, Colorado, Illinois, Michigan, Nebraska, and Nevada, the members of the boards controlling the State universities are elected by popular vote, but in the great majority of cases they are appointed by the governor of the State by and with the advice and consent of the Senate.

Notice has been given before of the change in the admission requirements to the United States Military Academy and of the largely increased number of cadets authorized at that institution as well as at the United States Naval Academy at Annapolis, Md. The rules governing the appointment and admission of candidates to those institutions and the courses of study to be pursued therein are printed in this chapter.

*Professional schools* (Chapter XXXVI).—The statistics of professional schools show but little variation from those of the preceding year. For five successive years there has been a decrease in the number of theological students. The number now is 7,343, smaller by 204 than the number of the preceding year, and smaller by 1,028 than the number in 1898.

Since 1891 the numbers in law and dentistry have nearly trebled. There are now 102 law schools, with 13,912 students; 56 dental schools, with 8,420 students; 59 schools of pharmacy, with 4,427 students. Medical schools number 154, with 26,821 students, of whom 1,551 are homeopathic students.

*Agricultural and mechanical colleges* (Chapter XXXVII).—These institutions owe their origin to an act of Congress approved July 2, 1862, granting to each State in the Union 30,000 acres of land for each Representative to which it was entitled in Congress. The total amount of land reported as having been received under this act is 10,320,843 acres, of which 9,385,863 acres have been sold. The proceeds derived from the sale of the lands amount to \$11,126,534, an average of about \$1.19 per acre. The income derived therefrom amounts to \$684,141, or about 6.1 per cent on the principal. Under an act of Congress approved August 30, 1890, each State and Territory receives annually \$25,000 for the support of these institutions. The total income for the year ended June 30, 1902, was \$9,167,059, of which amount \$2,000,060 was derived from Federal sources and \$4,253,257 was contributed by the several States and Territories. The amount given by the States and Territories exceeds the amount for the previous year by \$1,179,521. The property held by the agricultural and mechanical colleges is valued at \$69,660,303, the additions thereto during the year amounting to over \$3,000,000.

The total number of students reported by these institutions was 47,047, of which number 30,787 were enrolled in the agricultural and mechanical departments. Of the latter number, 4,908 were reported by institutions for colored students, the remainder being in attendance at institutions for white students and at institutions in which no distinction is made in the admission of students on account of race or color. The reports show that 4,547 students were enrolled in short or special courses.

A brief summary of the legislation enacted during the year affecting these institutions is given in the chapter, as well as changes in courses of study and brief descriptions of new buildings. A short statement concerning the first session of the Graduate School of Agriculture is also included.

All of which is respectfully submitted.

W. T. HARRIS,  
*Commissioner.*

<sup>a</sup> The compulsory period here given is in many cases extended or shortened under certain circumstances.

<sup>b</sup> Not limited by law.

<sup>c</sup> Inclusive.

<sup>d</sup> No State school census.

<sup>e</sup> No compulsory law.

<sup>f</sup> Applies only to Baltimore city and Allegany County.

<sup>g</sup> Returns imperfect.

<sup>h</sup> Unmarried.

TABLE 4.—Number of pupils enrolled in the common schools at different dates, and the relation of the enrollment to the school population.

State or Territory.	Number of different pupils of all ages enrolled during the school year (excluding duplicate enrollments).					Per cent of school population (i. e., of children 5 to 18 years of age) enrolled.

*Method of ascertaining average attendance.*—The average daily attendance during a year (which is the average number of pupils actually present each day the schools were in session) may be computed as follows:

First, for a single school: Add together the number of pupils present each school day during the year, and divide the sum (which is the "aggregate attendance in days") by the number of such school days.

Second, for a group of schools having the same number of school days in the year (as the schools of most cities have): Divide the combined aggregate attendance in days of all the schools by the number of school days in the year.

Third, for a system of schools having different lengths of school year (as, for instance, those of a county): Add together the average attendance of the component schools and groups of the system, as ascertained by the foregoing rule. For larger systems, as those of a State or of the United States, the summing-up process is continued in the same way.

In a system of schools such as is specified under the heading "Third," the average number of days in the school year for the whole system is found by dividing the combined aggregate attendance in days of all the schools of the system by the average attendance as ascertained by the method given. See observations on Table 8.

*Observations on ascertaining the average school term* (Table 8).—The "aggregate number of days' schooling given" to all pupils (see column 7), which is the same thing as the aggregate number of days attended by all the pupils, has been computed for those States which do not make an explicit report of this item by multiplying the average daily attendance of pupils by the average length of school term in days.

Conversely, the average length of school term (column 6) for the United States as a whole and for each of its geographical divisions has been obtained by dividing the aggregate number of days attended by the average daily attendance.

By this method the school term of each State, in computing the average term for a number of States, is in fact given a weight proportioned to the school attendance of the State, as should be done under a correct interpretation of the expression, "Average length of school term." The result might more properly be called "Average length of attendance," which is essentially what it is desired to know.

A method which has been in use in some States for finding the average school term of a county, for instance, is to weight the different school terms of the towns or districts the county is composed of by the number of schools in each. In other words, the total number of days (or months) all the schools of a county were kept is divided by the total number of schools to get the average time each one was kept. So, in finding the average term for the State, the school is taken as the unit instead of the pupil. When the schools differ much in size (number of pupils), as they do in all mixed urban and rural systems, varying from some half a dozen to 500 or more pupils each, the average term obtained by this method varies considerably from that obtained by the Bureau's method. The long terms of the large city schools not being given their proper weight, the resulting average is too small. The same objection applies still more forcibly to weighting the school terms of the different counties or towns by the number of school districts in each.

Another method is to divide the total number of months or days taught by the number of teachers. This is better than the preceding method, as it takes some account of the size of the schools—that is, an eight-grade school with eight teachers has eight times the weight, in determining the average term, than a district school with one teacher has. This is manifestly as it should be. If every teacher taught the same number of pupils the result would be the same as by the Bureau's method. Care must be taken in working by this method to use the number of teachers' places (or number of teachers necessary to supply the schools) for the divisor; for if a teacher teaches a school or grade part of the term, and is replaced by another for the rest of the term, the two should obviously count as one teacher for the combined

period of service. The liability to overlook this distinction in practice, as well as the inequality in the number of pupils to a teacher, makes this method generally objectionable.

Still another and most faulty method is to add together the school terms of the different counties or towns and divide by the number of such counties or towns; i. e., the simple arithmetical mean is taken. An example of this occurs in a school report, where it is stated that 14,193 pupils in one district attended 185 days and 856 pupils in another district attended 160 days, while the average time the whole 15,049 pupils attended is computed at  $172\frac{1}{2}$  days, although nearly all (16 out of every 17) attended 185 days. This method, if it can be so called, gives altogether too short an average term, and nothing can be said in defense of it. It is as if, wishing to get the population per square mile of Minnesota and Dakota combined, we said, population per square mile of Minnesota, 9.86; of Dakota, 0.92; average number of persons per square mile in the combined territory  $(0.92+9.86)\div 2=5.39$ , instead of dividing the total population of the two States by the combined area in square miles.

The "aggregate number of days' attendance" is a statistical item of the utmost simplicity and of great value, about the meaning of which there can be little or no difference of opinion. Every teacher's register that records the number of pupils present each day in school, as they all presumably do, contains the data for ascertaining it for that school for the school year by the simple process of addition or summing up.

There are a few States that do not ascertain at all how long their schools were taught, and others that use methods so faulty that they also are totally in the dark in the matter. Yet this is one of the most necessary and fundamental items of information in determining the amount of school instruction given.

TABLE 8.—(1) *Average length of school term at various periods; (2) aggregate number of days' schooling given to all pupils; (3) the same compared with the school population and the enrollment (columns 8 and 9).*

\* The reports of private schools are more or less incomplete, and the number of pupils as given may be taken to represent the minimum number of private pupils in the States furnishing this item. In forming the totals the States not reporting are estimated.

<sup>a</sup> Including buildings rented.

<sup>b</sup> Average for those States reporting salaries.

<sup>c</sup> High-school teachers' wages not included.

<sup>d</sup> In 1897-98.

<sup>e</sup> Number of schools.

<sup>f</sup> In 1899-1900.

<sup>g</sup> In 1889-90.

<sup>h</sup> Approximately.

<sup>i</sup> In 1895-96.

<sup>j</sup> Number of schools, not including those in separate districts.

<sup>k</sup> Excluding the wages of teachers holding State certificates.

<sup>l</sup> Returns imperfect.

<sup>m</sup> "Public - school" property only.

<sup>n</sup> In 1893-94.

<sup>o</sup> In 1891-92.

<sup>p</sup> In 1892-93.

<sup>q</sup> In 1900-01.

<sup>r</sup> In 1896-97.

<sup>s</sup> In 1898-99.

<sup>t</sup> In 1894-95.

<sup>u</sup> Number of school districts.

<sup>v</sup> Reported by school census enumerators as attending private schools.

<sup>w</sup> Does not include high-school buildings.

<sup>x</sup> Includes only children 5 to 17 (as reported by school census enumerators) who have attended private but not public schools during the year.

<sup>y</sup> Not including furniture and apparatus.

*Average salaries.*—In computing (for Table 10) the average monthly wages of all the male (or female) teachers in the several groups of States the average wages of each of the States in question is multiplied by the corresponding number of teachers. The sum of the resulting products is then divided by the sum of the teachers, and the quotient is the average wages of all. Each rate of wages thus receives its due weight.

To illustrate: If 48 teachers receive an average of \$72.20 per month, they all receive in a month \$3,466; if 473 other teachers receive an average of \$48.60 per month, these together receive in a month \$22,988; the 521 teachers combined, therefore, receive per month \$26,454, or an average of \$50.77.

Attention is called to this subject for the reason that the practice of taking the arithmetical mean of a number of rates of wages (the mean is \$60.40 in the above case) in order to get the average of all is so common as to vitiate, to a considerable extent, the published statistics of average wages.

TABLE 11.—(1) *Length of school term.* (2) *The aggregate number of days' schooling given compared with the school population.*

Year.	Average length of school term, in days.						Average number of days' schooling given for every child 5 to 18 years of age.

a Reimbursement for superintendents' and teachers' salaries, high school tuition, and schooling State wards.

b Approximately.

c Includes receipts from sale of bonds.

d Includes receipts from "other sources" in Philadelphia, if any.

e May include some State taxes.

f Includes United States appropriation.

g Includes poll tax.

h Not reported separately.

i From State treasury.

j Not reported.

k Included, if any, in State taxes.

l Apportionment of Territorial and county school fund.

m Returns imperfect.

n For "public schools."

o Some funds from taxation may be included.

p Includes proceeds of bonds sold.

q State tuition fund.

r Includes some receipts from "other sources."

s Included in State taxes.

t Includes income from State school fund.

u Includes taxes on railroads (\$105,504), and on collateral inheritances (\$287,053).

TABLE 13.—*The school revenue compared with the school population and the adult male population (21 years and upward); percentage analysis of the school revenue.*

## II.—LEGAL PROVISIONS GOVERNING THE PRACTICE OF MEDICINE IN THE SEVERAL STATES.

In the following pages is given a synopsis of the legal requirements for admission to the practice of medicine in the several States and Territories of the United States. The medical laws of nearly all of the States and Territories are of comparatively recent date, and this compilation includes the provisions of law in ten States and Territories enacted in 1903. In all cases where the laws provide for reciprocity of licensure with other States and Territories or with foreign countries that fact is stated. Following the requirements of each State are given the name and title of the officer to whom application for license should be made.

*Alabama.*—Examination by the State board of examiners, or before one of the county boards. The latter can examine only the graduates of medical colleges indorsed by the State Medical Association. There is no provision for reciprocity of licensure with other States. Dr. W. H. Sanders, Chairman of State Board of Medical Examiners, Montgomery, Ala.

*Arizona.*—"The law provides for the issuance of license to those who are residents of Arizona, are of the age of 21, and are of good moral character, and who in addition (1) present diploma and pass examination; or (2) present diploma and show certificate of license under the laws of 1901 or 1897; or (3) have practiced for five successive years previous to the passage of the act and pass an examination." <sup>a</sup> (Act of March 19, 1903.) Dr. William Duffield, Secretary of the Territorial Board of Medical Examiners, Phoenix, Ariz.

*Arkansas.*—Examination before one of the three State boards of medical examiners. No provision in the law for the recognition of licenses of other States. (Act of 1903.) Dr. J. P. Runyan, Secretary of the State Medical Board of the Arkansas Medical Society, Little Rock, Ark.; ———, Secretary of the Homeopathic State Medical Board, ———; ———, Secretary of the Eclectic State Medical Board, ———.

*California.*—Examination before the State board of medical examiners. The candidate must have graduated from a medical college, the requirements of which equal those prescribed by the Association of American Medical Colleges. Reciprocity is provided for by law with the District of Columbia or any State or Territory, provided the legal requirements in such State or Territory are equal to those of California, and such State or Territory will recognize the certificate of California. (Act of February 27, 1901.) Dr. George G. Gere, Secretary of State Board of Medical Examiners, San Francisco, Cal.

*Colorado.*—Examination or diploma of a recognized medical college. Only residents of Colorado are registered. Dr. S. D. Van Meter, Secretary of State Board of Medical Examiners, Denver, Colo.

*Connecticut.*—Examination and diploma of a recognized medical college. No reciprocity provision. (Act of June 11, 1901.) Dr. C. A. Lindsley, Secretary of State Board of Health, New Haven, Conn.

*Delaware.*—Examination, a medical diploma, and a competent common-school education. Applicants licensed by other States having requirements equal to those demanded by the State of Delaware may be licensed without examination. (Acts of April 18, 1895, and March 16, 1899.) Dr. P. W. Tomlinson, Secretary of State Medical Council, Wilmington, Del.

*District of Columbia.*—Examination and medical diploma after study of medicine for three years if the diploma was granted prior to June 30, 1898, or four years if granted after that date. The law provides for reciprocity of licensure. (Act of

---

<sup>a</sup>Provisions of the new medical law of Arizona as given by the Jour. A. M. Assoc., Apr. 4, 1903.

June 3, 1896.) Dr. W. C. Woodward, Secretary of the Board of Medical Supervisors, Washington, D. C.

*Florida*.—Examination and diploma of a recognized medical college. No provision for reciprocity. (Act of May 17, 1895.) There are nine boards of medical examiners, one representing each of the seven judicial districts, one the homeopaths, and one the eclectics.

*Georgia*.—Examination and diploma of a recognized medical college. There is no provision for reciprocity. (Act of December 12, 1894.) Dr. J. B. S. Holmes, Secretary of the Board of Examiners of the "Regular School of Medicine," Atlanta, Ga.; Dr. R. E. Hinman, Secretary of the Homeopathic Board of Examiners, Atlanta, Ga.; Dr. M. T. Salter, Secretary of the Eclectic Board of Examiners, Atlanta, Ga.

*Idaho*.—Examination and diploma of a reputable medical college. There is no provision for reciprocity of licensure. (Act of 1889.) Dr. R. L. Nourse, Secretary of the State Board of Medical Examiners, Hailey, Idaho.

*Illinois*.—Examination and diploma of a recognized medical college. The law permits the granting of licenses without examination to graduates of Illinois medical colleges, but the board requires all to pass the examination. Reciprocity of licensure is provided for by the board. Dr. J. A. Egan, Secretary of the State Board of Health, Springfield, Ill.

*Indiana*.—Examination and diploma of a reputable medical college. Anyone who matriculated in a recognized medical college in Indiana prior to January 1, 1901, and who, with a diploma from such school, makes application for a license prior to January 1, 1905, shall be granted a certificate without examination. The law provides for reciprocity with other States. Dr. W. T. Gott, Secretary of the State Board of Medical Registration and Examination, Crawfordsville, Ind.

*Iowa*.—Examination and graduation from a recognized medical college having a four years' course of study of not less than twenty-six weeks each. There is no provision for reciprocity. Dr. J. F. Kennedy, Secretary of State Board of Medical Examiners, Des Moines, Iowa.

*Kansas*.—(1) Examination after study of medicine four periods of not less than six months each; or, (2) a license may be granted without examination to graduates of medical schools in good standing of the United States or foreign countries; or, (3) licenses may be granted on the certificate of any board of examination of any other State or Territory of the United States or any foreign country. (Act of March 22, 1901.) Under date of March 20, 1903, the State board published a circular letter stating: "No registrations will be made on diplomas or certificates from other State boards." Dr. H. W. Roby, Secretary of State Board of Medical Registration and Examination, Topeka, Kans.

*Kentucky*.—(1) Diploma from a reputable medical college of Kentucky, or (2) from some reputable medical college of some other State or country, indorsed as such by the State Board of Health. (Act of 1898.) Dr. J. N. McCormack, Secretary of State Board of Health, Bowling Green, Ky.

*Louisiana*.—Examination and diploma of a medical school in good standing and a fair elementary education. No provision for reciprocity. (Act of July 13, 1894.) Dr. F. A. Larue, Secretary of the Board of Medical Examiners representing the Louisiana State Medical Society, New Orleans, La.; Dr. Gayle Aiken, Secretary of the Board of Medical Examiners representing the Hahnemann State Medical Society, New Orleans, La.

*Maine*.—Examination and graduation from a medical college in good standing, maintaining a standard of preliminary education and of medical instruction approved by the board. Provides for reciprocity with other States on rules and regulations made by the board and approved by a justice of the supreme judicial court. (Act of March 22, 1901.) Dr. A. K. P. Meserve, Secretary of Board of Registration of Medicine, Portland, Me.

*Maryland.*—Examination by one of the two State boards. The applicant must have obtained a competent common-school education, and either received a diploma from some incorporated medical college in the United States or a diploma or license conferring the right to practice in some foreign country; said diploma, if from a college in the United States, must have been conferred by a college requiring a four years' standard of education as defined by the American Medical College Association or the Intercollegiate Committee of the American Institute of Homeopathy. Provides for reciprocity with the District of Columbia and with other States. (Act of April 11, 1902.) Dr. J. McP. Scott, Secretary of the Board of Medical Examiners representing the Medical and Chirurgical Faculty of Maryland, Hagerstown, Md.; Dr. J. S. Garrison, Secretary of the Board of Medical Examiners representing the Maryland State Homeopathic Society, Easton, Md.

*Massachusetts.*—Examination. No provision for reciprocity with other States. (Act of April 1, 1896.) Dr. E. B. Harvey, Secretary of Board of Registration in Medicine, Boston, Mass.

*Michigan.*—Examination. The applicant must have a diploma from a legally incorporated and reputable college of medicine having at least a four years' course of seven months each, and must have at least a high school education. Provides for reciprocity with the States, Territories, districts, or provinces of the United States and with any foreign nation. (Act of 1903.) Dr. B. D. Harison, Secretary of State Board of Registration in Medicine, Sault Ste. Marie, Mich.

*Minnesota.*—Examination. If graduated since January 1, 1899, the applicant must have attended four courses of not less than twenty-six weeks each. No provision for reciprocity. (Act of April 22, 1895.) Dr. C. J. Ringnell, Secretary of State Board of Medical Examiners, Minneapolis, Minn.

*Mississippi.*—Examination. No provision for reciprocity. (Code of 1892, ch. 104.) Dr. J. F. Hunter, Secretary of State Board of Health, Jackson, Miss.

*Missouri.*—Examination. Applicants must furnish evidence of their preliminary qualifications. No provision for reciprocity. (Act of March 12, 1901.) Dr. W. F. Morrow, Secretary of the State Board of Health, Kansas City, Mo.

*Montana.*—Examination and diploma of recognized medical school after attendance on four courses of lectures of at least six months each. No provision for reciprocity. Dr. William C. Riddell, Secretary of State Board of Medical Examiners, Helena, Mont.

*Nebraska.*—Diploma of a recognized medical college and an examination. Dr. G. H. Brash, Secretary of State Board of Health, Beatrice, Nebr.

*Nevada.*—The diploma of a recognized medical college entitles the holder to a license. Otherwise an examination is required. No provision for reciprocity of licensure. Dr. S. L. Lee, Secretary of State Board of Medical Examiners, Carson City, Nev.

*New Hampshire.*—Examination by one of three State boards. The applicant must have a preliminary education equivalent to a high school education, must have studied medicine four years of nine months each, have attended four courses of six months each in a medical college registered as satisfactory, and must have received a diploma from a registered medical college or have received a certificate or license giving the right to practice in some foreign country. Persons holding licenses in other States having equal requirements may be licensed without examination. (Act of 1897.) Hon. Channing Folsom, Regent of State Boards of Medical Examiners, Concord, N. H.

*New Jersey.*—Examination. Applicants must have completed at least a four-years' course in a normal, manual training, or high school, or its equivalent; must have either a diploma from some legally incorporated medical college in the United States, or a diploma or license conferring the right to practice in some foreign country, and also studied medicine not less than four full school years of at least nine months

each, including four satisfactory courses of lectures of at least seven months each, in four different calendar years in a medical college. The law provides for reciprocity with other States. (Act of April 8, 1903.) Dr. E. L. B. Godfrey, Secretary of State Board of Medical Examiners, Camden, N. J.

*New Mexico.*—Graduation from a medical college in good standing. A medical college in good standing "is declared to be one of at least ten years continuous existence, one which now requires a high school certificate, or its equivalent, for admission to it, and one which now or hereafter requires an attendance on, and gives four full courses in four separate years, and one which has ample clinical facilities such as are furnished in large cities." The law provides for reciprocity with other States and Territories. (Act of March 12, 1903.) Dr. W. G. Hope, Secretary of New Mexico Board of Health, Albuquerque, N. Mex.

*New York.*—(1) Examination; (2) diploma from a medical college registered by the Regents of the University of the State of New York, or a diploma or license conferring the right to practice in some foreign country; (3) the preliminary education required by the regents; (4) study of medicine four years of nine months each, including attendance at a registered medical college four years of six months each. The law provides for reciprocity with other States and Territories. James Russell Parsons, Secretary of the Regents of the University of the State of New York, Albany, N. Y.

*North Carolina.*—Examination. Applicant must have a diploma from a medical college in good standing, or in lieu thereof may present a license to practice in some other State. All applicants are examined. (Act of 1899.) Dr. J. Howell Way, Secretary of State Board of Medical Examiners, Waynesville, N. C.

*North Dakota.*—Examination after attending three courses of lectures of at least six months each. No provision for reciprocity of licensure. Dr. H. M. Wheeler, Secretary of State Board of Medical Examiners, Grand Forks, N. Dak.

*Ohio.*—Examination. Applicants must have graduated from recognized medical colleges and have practically a high school education. The preliminary requirement applies only to those who have matriculated since January 1, 1900. Those who were matriculated in recognized Ohio medical colleges January 1, 1900, may receive certificates under the act of February 27, 1896. The law provides for reciprocity with any State, Territory, or the District of Columbia. (Act of April 14, 1900.) Dr. Frank Winders, Secretary of State Board of Medical Registration and Examination, Columbus, Ohio.

*Oklahoma.*—Examination. Applicants must furnish proof of ten years' continuous practice or of graduation from a reputable medical college. (Act of March 12, 1903.) Dr. E. E. Cowdrick, Secretary of Territorial Board of Health, Enid, Okla.

*Oregon.*—Examination. The law provides for reciprocity with any State in the United States requiring an examination for license. (Act of February 17, 1903.) Dr. B. E. Miller, Secretary of State Board of Medical Examiners, Portland, Ore.

*Pennsylvania.*—Examination. The applicant must have a "competent common school education" and a diploma from a medical college in the United States, or a diploma or license giving the right to practice in some foreign country. If graduated after July 1, 1895, he must have studied medicine four years, including three courses of lectures. Persons holding licenses in other States having equal requirements shall receive a license without further examination. (Act of May 18, 1893.) Hon. James W. Latta, Secretary of Medical Council of Pennsylvania, Harrisburg, Pa.

*Rhode Island.*—Authority to practice medicine "shall be a certificate from the State board of health, and said board shall, upon application, after examination, issue a certificate to any reputable physician who intends to practice medicine or surgery in this State and who shall present himself before the State board of health and pass in a satisfactory manner such examination as said board may require." (Ch. 165 of

the General Laws as amended November, 1901.) Dr. G. T. Swarts, Secretary of State Board of Health, Providence, R. I.

*South Carolina.*—Examination and diploma of a recognized medical college. Graduates of medical colleges in South Carolina having a four-years' course are exempt from examination. There is no provision for reciprocity. (Act of 1893 as amended February 15, 1901.) Dr. S. C. Baker, Secretary of State Board of Medical Examiners, Sumter, S. C.

*South Dakota.*—Examination and diploma from a recognized medical college having a four-years' course of study of not less than twenty-six weeks each. The law provides for reciprocity with the District of Columbia and any State or Territory of the United States. (Act of March 5, 1903.) Dr. H. E. McNutt, Secretary of State Board of Medical Examiners, Aberdeen, S. Dak.

*Tennessee.*—Examination. No provision of law for reciprocity. (Act of April 22, 1901.) Dr. T. J. Happel, Secretary of State Board of Medical Examiners, Trenton, Tenn.

*Texas.*—Examination. The law permits the registration of persons who have been licensed in any other State or Territory having equal standards of requirements. (Act of February 22, 1901.) Dr. M. M. Smith, Secretary of Board of Medical Examiners for the State of Texas, Austin, Tex.; Dr. N. O. Brenizer, Secretary of Board of Homeopathic Medical Examiners of the State of Texas, Austin, Tex.; Dr. L. S. Downs, Secretary of Board of Eclectic Medical Examiners of the State of Texas, Galveston, Tex.

*Utah.*—Examination and diploma of a medical college in good standing. (Acts of 1892 and 1894.) Dr. R. W. Fisher, Secretary of State Board of Medical Examiners, Salt Lake City, Utah.

*Vermont.*—Examination and diploma of a medical college or university. The law provides for reciprocity. (Sec. 4633 of Vermont Statutes.) Dr. C. W. Strobell, Secretary of Board of Censors of the Vermont State Medical Society, Rutland, Vt.; Dr. E. B. Whitaker, Secretary of Homeopathic Board of Censors, Barre, Vt.; Dr. P. L. Templeton, Secretary of Eclectic Board of Censors, Montpelier, Vt.

*Virginia.*—Examination and a medical diploma. "The said board shall have, in their discretion, authority to accept in lieu of examination of an applicant a diploma or other satisfactory evidence of the graduation of the applicant in some medical college chartered by the State or Territory in which the same is situated, and a certificate from the examining board of any State or Territory of the United States or the District of Columbia, showing that said applicant has passed a satisfactory examination as to his proficiency, and obtained license from said board to practice medicine and surgery in said State, Territory, or District." (Act of April 23, 1903.) Dr. R. S. Martin, Secretary of State Board of Medical Examiners, Stuart, Va.

*Washington.*—Examination. Applicants must have graduated from a medical college "now having at least a three years' graded course." The law provides for reciprocity with any State of the United States. (Act of Feb. 18, 1901.) Dr. T. B. Swearingen, Secretary of State Board of Medical Examiners, Tacoma, Wash.

*West Virginia.*—Examination. There is no provision for reciprocity. (Act of 1895.) Dr. A. R. Barbee, Secretary of State Board of Health, Point Pleasant, W. Va.

*Wisconsin.*—Examination. An applicant must have a diploma from a reputable medical college that requires at least four courses of not less than seven months each and an elementary education equivalent to that necessary to enter the junior year of an accredited high school of the State, and after the year 1906 requires a preliminary education equivalent to graduation from such high school. Applicants presenting licenses from other States accompanied by a diploma from a reputable medical college may be licensed without examination, at the discretion of the board. (Act of May 22, 1903.) Dr. F. A. Forsbeck, Secretary of State Board of Medical Examiners, Milwaukee, Wis.

*Wyoming.*—Examination or diploma of a college which is "a member of the American Association of Medical Colleges, the Homeopathic Institutes, or the National Eclectic Medical Association, or any college of similar standing in foreign countries." The law does not provide for reciprocity. (Act of Feb. 14, 1899.) Dr. G. P. Johnston, Secretary of State Board of Medical Examiners, Cheyenne, Wyo.

### III. LEGAL PROVISIONS GOVERNING THE PRACTICE OF DENTISTRY IN THE SEVERAL STATES.

#### ALABAMA.

Board of dental examiners consists of five members elected by the Alabama Dental Association for terms of five years.

*Requirements for licensure.*—Examination by the board of dental examiners.

*Penalty for violation.*—Contracts void unless dentist is licensed. (Ch. 34, Code of 1896, as amended by act of March 4, 1901.)

#### ARIZONA.

Territorial board of dental examiners consists of five resident practicing dentists, graduates from some reputable dental college duly authorized to grant degrees in dentistry, appointed by the governor for terms of four years.

*Requirements for licensure.*—Examination by the Territorial board of dental examiners. Applicants for examination shall (1) furnish satisfactory evidence of having graduated from a reputable dental college of the United States, which must be a member of the National Association of Dental College Faculties; or (2) shall have graduated from a high school or similar institution of learning in Arizona or some other State or Territory of the United States, requiring a four years' course of study, and have completed an apprenticeship of three years of twelve months each with a licensed practitioner of dentistry; or (3) furnish a certificate from the State board of dental examiners, or similar body of some other State or Territory of the United States, showing that he or she has been a licensed practitioner of dentistry in that State or Territory for at least five years.

*Penalty for violation.*—Fine of \$100 to \$200, or imprisonment of three to six months, or both, for each and every offense. (Act of March 17, 1903.)

#### ARKANSAS.

Board of dental examiners consists of five reputable practicing dentists recommended by the State Dental Society and appointed by the governor for terms of two years.

*Requirements for licensure.*—Examination by the board of dental examiners, or a diploma from a reputable college of dentistry may be accepted by the board.

*Penalty for violation.*—Fine of \$5 to \$25; every day of engagement or attempted engagement in illegal practice being considered a separate offense. (Act of May 23, 1901.)

#### CALIFORNIA.

Board of dental examiners of California consists of seven reputable and ethical practicing dentists appointed by the governor for terms of four years. None of the members of the board shall be members of the faculty of any dental college or shall have any financial interest in such college.

*Requirements for licensure.*—Examination by the board of dental examiners of California. Applicants for examination must have graduated from a reputable dental

college of the United States of America, which must have been indorsed by the board of dental examiners of California, and be a member of the National Association of Dental College Faculties; or shall have graduated from a high school or similar institution in the United States, requiring a four years' course of study, and give evidence of completion of apprenticeship of three years of twelve months each with a licensed practitioner of dentistry in California, or furnish a certificate from the State board of dental examiners or similar body of some other State in the United States, showing that he or she has been a licensed practitioner in that State for at least five years.

*Penalty for violation.*—First offense, fine of \$50 to \$200; subsequent offenses, fine of \$250 to \$500, or imprisonment for six months. (Act of March 23, 1901.)

COLORADO.

State board of dental examiners consists of five practitioners of dentistry, three of whom are chosen from a list recommended by the State Dental Association, appointed by the governor with the consent of the senate.

*Requirements for licensure.*—Examination by the board of dental examiners, the prerequisite being a diploma of graduation from some reputable dental college, school, or university dental department in any of the United States.

*Penalty for violation.*—Fine of \$100 to \$300; each day of illegal practice being regarded as a separate offense. (Act of April 17, 1897.)

CONNECTICUT.

Board of dental commissioners consists of five practicing dentists of not less than ten years' experience in practice, appointed biennially by the governor for terms of two years.

*Requirements for licensure.*—Examination by the dental commissioners. An applicant for examination shall have received a diploma or other sufficient certificate of graduation from some reputable dental college, or medical college having a department of dentistry and recognized by the laws of the State wherein the same is situated, or shall have spent three years under the instruction of some reputable dentist, or shall have had at least three years' continuous practice as a dentist.

*Penalty for violation.*—Fine not exceeding \$50 for each offense; the unlawful practice of dentistry for each week being considered a separate offense. (General Statutes of 1902, secs. 4740-4751.)

DELAWARE.

Board of dental examiners consists of five reputable practicing dentists, appointed by the governor for terms of four years.

*Requirements for licensure.*—Examination by the board. Assistants in practice must pass same examination.

*Penalty for violation.*—Fine of \$50 to \$300, or imprisonment of not more than six months. (Act of March 31, 1885, as amended March 23, 1899.)

DISTRICT OF COLUMBIA.

Board of dental examiners consists of five reputable dentists who have for three years prior to their appointment been actively engaged in the practice of dentistry in the District of Columbia, appointed by the Commissioners of said District for terms of five years.

*Requirements for licensure.*—Examination by the board of dental examiners, or graduation from a dental college requiring a three years' course of study.

*Penalty for violation.*—Fine of \$50 to \$200, or imprisonment of thirty to ninety days. (Act of Congress of June 6, 1892.)

## FLORIDA.

Board of dental examiners consists of five dentists who have practiced in the State not less than three years, appointed by the governor for terms of two years.

*Requirements for licensure.*—Examination by the board.

*Penalty for violation.*—Fine of not more than \$500, nor more than six months' imprisonment, or both. (Revised Statutes of 1892, secs. 828 and 829; act of June 3, 1899.)

## GEORGIA.

Board of dental examiners consists of five members, appointed by the governor for terms of five years; one member is appointed each year from four names of dentists selected by the State Dental Society.

*Requirements for licensure.*—Board shall examine all applicants furnishing satisfactory evidence of having graduated from a reputable school of dentistry, or having been licensed after examination by any other State board, and if such applicant pass a satisfactory examination, a license to practice dentistry shall be granted.

*Penalty for violation.*—Fine of not more than \$1,000, or imprisonment not to exceed six months; or work in the chain gang not to exceed twelve months; any one or more of these punishments. (Code of 1895, vol. 3, sec. 1037; act of December 15, 1897.)

## IDAHO.

State board of dental examiners consists of five practicing dentists appointed by the governor.

*Requirements for licensure.*—Examination by the board of dental examiners. Applicant must have had three years' experience in a dental office, possess a certificate from some other State board, or a diploma from a legally authorized dental college.

*Penalty for violation.*—Fine of \$50 to \$200. (Act of February 16, 1899.)

## ILLINOIS.

State board of dental examiners consists of five practicing dentists, appointed by the governor for terms of five years.

*Requirements for licensure.*—Examination by the board, or diploma from some reputable dental college, or an M. D. diploma from any reputable medical college, or ten years' practice in another State.

*Penalty for violation.*—Fine of \$25 to \$100. (Act of May 30, 1881, as amended April 24, 1899.)

## INDIANA.

State board of dental examiners consists of five practicing dentists, one appointed by the governor, one by the State board of health, and three by the State Dental Association.

*Requirements for licensure.*—Diploma from a reputable dental college, or examination.

*Penalty for violation.*—Fine of \$25 to \$200. (Act of March 6, 1899.)

## IOWA.

State board of dental examiners consists of five practicing dentists, appointed by the governor from a list submitted by the State Dental Society.

*Requirements for licensure.*—Examination by the board of dental examiners. Applicant for license must be a graduate of a reputable dental school recognized by the board.

*Penalty for violation.*—Fine not exceeding \$200, or imprisonment not exceeding forty days, or both. (Act of April 16, 1900.)

KANSAS.

State board of dental examiners consists of three practicing dentists appointed by the governor for terms of four years.

*Requirements for licensure.*—Examination by the State board of dental examiners or a diploma from the faculty of some reputable dental college, school, or university department in good standing, duly authorized by the laws of this State or some other of the United States, or the laws of some foreign government, and in which college, school, and university department there was, at the time of issuance of such diploma, annually delivered a full course of lectures and instructions in dentistry or dental surgery.

*Penalty for violation.*—Fine of \$25 to \$100. (Act of Feb. 24, 1903.)

KENTUCKY.

Board of dental examiners consists of five examiners, members of the State Dental Association, elected by the association.

*Requirements for licensure.*—Examination by the board of dental examiners, or diploma from a dental college authorized by the laws of this State, or some other of the United States, or a foreign country.

*Penalty for violation.*—Fine of \$50 to \$200 for each offense. (Act of May 1, 1893.)

LOUISIANA.

Louisiana State board of dentistry consists of five dentists, appointed by the governor for terms of seven years.

*Requirements for licensure.*—A certificate of qualification from the Louisiana State board of dentistry. The board is required to prescribe in its regulations what conditions shall constitute a good standing for a dental college and shall issue certificates of good standing to colleges fulfilling said conditions.

*Penalty for violation.*—Fine not exceeding \$100, or imprisonment not exceeding three months, or both. (Act filed July 3, 1900.)

MAINE.

Board of dental examiners consists of five dentists, appointed by the governor, with the advice of the council, for terms of three years.

*Requirements for licensure.*—Examination by the board of dental examiners.

*Penalty for violation.*—Fine of \$25 to \$100 for each offense. (Statutes of Maine, 1885-1895, Freeman's Supplement.)

MARYLAND.

State board of dental examiners consists of six practicing dentists, appointed by the governor out of a list of nine dentists proposed by the State Dental Association.

*Requirements for licensure.*—Applicant for registration must have a diploma from a university or college of any State authorized to grant diplomas in dentistry, and may be examined by the board. A graduate of a regular college of dentistry may be exempted from examination.

*Penalty for violation.*—Fine of \$50 to \$300, or six months' imprisonment. (Laws of 1896, ch. 378.)

MASSACHUSETTS.

Board of registration in dentistry consists of five members appointed by the governor, with the advice and consent of the council, for terms of three years.

*Requirements for licensure.*—Examination by the board.

*Penalty for violation.*—Fine of \$50 to \$100, or three months' imprisonment. (Revised Laws of Massachusetts, 1902, ch. 76, secs. 24, 26, 28.)

## MICHIGAN.

Board of dental examiners consists of three dentists, appointed by the governor.

*Requirements for licensure.*—Examination, or diploma from any reputable dental college with a course of instruction and practice equivalent to that of the college of dental surgery of the University of Michigan.

*Penalty for violation.*—Fine of \$25 to \$100, or imprisonment for ninety days, or both. (Compiled Laws, 1897.)

## MINNESOTA.

Board of dental examiners consists of five resident practicing dentists, appointed by the governor for terms of three years from a list presented to him by the State Dental Association.

*Requirements for licensure.*—Examination by the State board upon presentation of a diploma of a dental college, approved by the board.

*Penalty for violation.*—Fine of \$20 to \$100, or imprisonment of one to three months, or both. (Laws of 1889, ch. 19.)

## MISSISSIPPI.

Board of dental examiners consists of five practicing dentists, appointed by the governor for terms expiring with that of the governor appointing them.

*Requirements for licensure.*—Examination by the board.

*Penalty for violation.*—Fine of not more than \$500 and imprisonment in the county jail not more than six months, or either. (Annotated Code of 1892, secs. 1454, 1528-1531.)

## MISSOURI.

Board of dental examiners consists of five members, appointed by the governor for terms of five years.

*Requirements for licensure.*—Diploma from some reputable dental college, or examination by the board. Applicants for examination shall have studied dentistry in this State for three years, or have a license from the dental board of another State.

*Penalty for violation.*—Fine of \$50 to \$200, or from twenty to sixty days' imprisonment, or both. (Revised Statutes of 1899, secs. 8526, 8528, 8529, 8534.)

## MONTANA.

Board of dental examiners consists of five practicing dentists, appointed by the governor for terms of five years.

*Requirements for licensure.*—Diploma, or examination by board. Applicants for examination shall give satisfactory evidence of having practiced three years or having been a bona fide student for three years under a licensed dentist.

*Penalty for violation.*—Fine of \$50 to \$200, or from one to three months' imprisonment, or both. (Code of 1895, secs. 621, 624, 631.)

## NEBRASKA.

The State board of health appoints three secretaries for terms of three years from a list furnished by the State Dental Society, who grant certificates.

*Requirements for licensure.*—Examination by the secretaries of the State board of health, or diploma from a reputable dental college.

*Penalty for violation.*—Fine of \$25 to \$50 for each offense. (Compiled Statutes, 1903, chap. 55, Art. II.)

NEVADA.

Board of dental examiners consists of five practicing dentists, appointed by the governor for terms of four years, from nominations made by the Nevada State Dental Society. The society must nominate twice the number to be appointed, and at least three of the members appointed must be members of the Nevada State Dental Society.

*Requirements for licensure.*—Examination by the board of dental examiners, or diploma from any reputable dental college, when the board is satisfied of the character of such institution.

*Penalty for violation.*—Fine of \$50 to \$200, or imprisonment for six months. (Act of March 16, 1895.)

NEW HAMPSHIRE.

State board of registration in dentistry consists of three practicing dentists, appointed by the governor with the advice of the council.

*Requirements for licensure.*—Examination by the board.

*Penalty for violation.*—Fine not exceeding \$100 for each offense. (Statutes and laws of 1901, chap. 134.)

NEW JERSEY.

Board of registration and examination in dentistry consists of five members, appointed by the governor for terms of five years upon recommendation of the State Dental Society.

*Requirements for licensure.*—Examination by the board. No person shall be examined by said board unless he has received a good common school education and a diploma from a dental school recognized by said board, or shall present the written recommendation of at least five licensed dentists of this State of five years' standing, certifying that he is qualified for such examination, or shall hold a diploma or license to practice in some foreign country and granted by some authority recognized by the board. The board may license without examination any applicant who has been duly licensed after examination in any other State, provided his professional education shall not be less than that required in this State.

*Penalty for violation.*—Fine of not less than \$50 for first offense; subsequent offenses, fine of not less than \$100, or imprisonment not less than two months, or both. (Act approved March 17, 1898, as amended March 22, 1901.)

NEW MEXICO.

Board of dental examiners consists of five practicing dentists, appointed by the governor for terms of four years.

*Requirements for licensure.*—Examination by the board, or a diploma from a college recognized by the National Association of Dental Examiners.

*Penalty for violation.*—Fine of \$20 to \$100, or imprisonment from one to three months, or both. (Law of 1897, secs. 3733, 3736, 3742.)

NEW YORK.

The State board of dental examiners is appointed by the board of regents of the university of the State from nominations made by the (State Dental) Society.

*Requirements for licensure.*—Examination by the board, the prerequisites being an education equivalent to that of the State high schools, a degree from a registered dental school, or a diploma or license to practice dentistry in some foreign country granted by some registered authority.

*Penalty for violation.*—First offense, fine of \$50; for subsequent offenses fine of \$100 or two months' imprisonment, or both. (Revised Statutes, by C. F. Birdseye, 1901; Public Health Law, Art. IX.)

## NORTH CAROLINA.

Board of dental examiners consists of six members of the North Carolina Dental Society elected by the said society at its annual meetings for terms of three years.

*Requirements for licensure.*—Examination by the board of dental examiners.

*Penalty for violation.*—Fine of \$25. (Code of 1883, sec. 3149-3154; act of March 3, 1887; act of March 3, 1891.)

## NORTH DAKOTA.

Board of dental examiners consists of five dentists practicing in the State, appointed by the governor for terms of five years.

*Requirements for licensure.*—Diploma from a reputable dental college, or examination by the board. Applicant for examination must have been engaged in active practice for at least three years preceding, or have studied under a regularly practicing dentist for such period.

*Penalty for violation.*—Fine not exceeding \$300, or sixty days' imprisonment, or both. (Revised Codes of North Dakota, 1895, secs. 293, 296, 299.)

## OHIO.

State board of dental examiners consists of five practicing dentists, not members of dental college faculties, appointed by the governor for terms of three years.

*Requirements for licensure.*—Examination by the State board of dental examiners. Applicants for examination must present a diploma from some legally chartered dental college. The board shall excuse from examination all graduates of dental colleges of the State of Ohio up to and including the June, 1905, session of the board. Upon a unanimous vote of the board, said board may excuse from examination an applicant holding a license to practice in some State requiring a diploma and examination.

*Penalty for violation.*—Fine of \$25 to \$100, or imprisonment of ten days to one month, or both. (Sec. 6991 of Bates's Annotated Ohio Statutes, 1900, and act of May 10, 1902.)

## OKLAHOMA.

The board of dental examiners consists of five practicing dentists, appointed by the governor.

*Requirements for licensure.*—Examination by the board, or diploma.

*Penalty for violation.*—Fine of \$25 to \$200, or six months' imprisonment, or both. (Revised Statutes of Oklahoma, 1903.)

## OREGON.

State board of dental examiners consists of five members, appointed by the governor from a list furnished him by the State Dental Association.

*Requirements for licensure.*—Examination by the board of dental examiners. An applicant for examination must present a diploma from some reputable dental college (i. e., a member of the National Association of Dental Faculties).

*Penalty for violation.*—Fine of \$50 to \$200, or six months' imprisonment. (Bellinger and Cotton's Codes and Statutes of Oregon, 1902, Vol. II, Title XXV, Chap. VIII.)

## PENNSYLVANIA.

Board of dental examiners consists of six practicing dentists of ten years standing, appointed by the governor from a list furnished by the State Dental Society. The examinations by this board are supervised by the "Dental Council" of the State.

*Requirements for licensure.*—Examination (including satisfactory evidence of practical proficiency in manipulation) and diploma from an institution in the United States recognized by the board of examiners as competent, or a diploma or license to practice dentistry in a foreign country. Holders of licenses from State boards of dental examiners or of health of other States may be exempt from examination.

*Penalty for violation.*—Fine of \$50 to \$200 for each offense. (Pepper and Lewis Digest, Supplement, 1894-1897.)

RHODE ISLAND.

The board of registration in dentistry consists of five graduates in dentistry practicing within the State, appointed by the governor, with the advice and consent of the senate, for three years.

*Requirements for licensure.*—Examination by the board of registration in dentistry.

*Penalty for violation.*—Fine of \$50 to \$100 for each and every offense. (Chap. 155, General Laws of 1896, as amended by acts of May 21, 1897, and January 29, 1901.)

SOUTH CAROLINA.

State board of dental examiners consists of five members elected by the State Dental Association.

*Requirements for licensure.*—Examination by the board.

*Penalty for violation.*—Fine of \$50 to \$300, or imprisonment, or the chain gang from one to twelve months. (Code of South Carolina, 1902.)

SOUTH DAKOTA.

State board of dental examiners consists of five practicing dentists, appointed by the governor for terms of five years from names furnished by the South Dakota State Dental Society. The society must furnish twice the number of names as there are appointments to be made.

*Requirements for licensure.*—Examination by the State board of dental examiners, but the board may issue a license without examination to an applicant having a diploma from a reputable dental college or dental department at any university. An applicant for examination other than a graduate must furnish evidence that he has been engaged in the active practice of dentistry for at least three years immediately preceding such examination, or that he has pursued the study of dentistry in the office or under the supervision of a regular practicing dentist for such period.

*Penalty for violation.*—Fine of not exceeding \$100, or imprisonment not exceeding thirty days, or both. (Acts of March 7, 1901, and March 11, 1903.)

TENNESSEE.

Board of dental examiners consists of six practicing dentists, appointed by the governor for terms of three years.

*Requirements for licensure.*—Acceptable diploma or examination by the board.

*Penalty for violation.*—Fine of \$25 to \$300. (Code of 1896, secs. 2627, 2628, 2631, 2634.)

TEXAS.

State board of dental examiners consists of six practicing dentists, appointed by the governor for terms of two years.

*Requirements for licensure.*—Examination by the State board of dental examiners or a diploma from some reputable dental college, school, or university department

duly authorized by the laws of this State or some other of the United States or some foreign country.

*Penalty for violation.*—Fine of \$25 to \$300 for each offense, each day in the practice constituting a separate offense. (Chap. 97, Laws of 1897.)

## UTAH.

The board of dental examiners consists of five members, appointed by the governor, with the advice and consent of the Senate, from practicing dentists in the State.

*Requirements for licensure.*—Examination by the board. Applicant for examination must have practiced dentistry for two years or have been a bona fide student for three years under a licensed dentist, or must possess a diploma from some dental college recognized by the National Association of Dental Examiners.

*Penalty for violation.*—Fine not exceeding \$300, or imprisonment for six months, or both. (Revised Statutes, 1898, as amended by act of March 12, 1903.)

## VERMONT.

Board of dental examiners consists of five dental graduates or practitioners, appointed by the governor biennially for terms of two years.

*Requirements for licensure.*—Examination by the board of dental examiners.

*Penalty for violation.*—Fine of \$25 to \$100. (Vermont Statutes, 1894, chap. 191; act of Nov. 8, 1898.)

## VIRGINIA.

State board of dental examiners consists of six dentists of acknowledged ability, appointed by the governor for terms of three years.

*Requirements for licensure.*—Diploma from a reputable dental college or examination approved by at least four members of the board.

*Penalty for violation.*—Fine of \$50 to \$200. (Code of 1887, secs. 1768–1769, 1772.)

## WASHINGTON.

Board of dental examiners consists of five practicing dentists, appointed by the governor for terms of two years.

*Requirements for licensure.*—Examination by the board of dental examiners. An applicant for examination must present a diploma from some dental college in good standing.

*Penalty for violation.*—Fine of \$50 to \$200 or imprisonment for not exceeding six months for each and every offense. (Ballinger's Annotated Codes and Statutes, 1897, as amended by act of March 18, 1901.)

## WEST VIRGINIA.

The board of dental examiners consists of five practicing dentists, appointed by the governor.

*Requirements for licensure.*—Examination by the board.

*Penalty for violation.*—Fine of \$50 to \$200 or imprisonment from one to three months, or both. (Act of February 20, 1897.)

## WISCONSIN.

State board of dental examiners consists of five practicing dentists, at least three of whom shall be members of the Wisconsin State Dental Society, appointed by the governor for terms of five years.

*Requirements for licensure.*—Examination by the State board of dental examiners, or graduation from a reputable dental college in which the applicant shall have pursued four full courses of lectures of at least seven months each and which requires for admission thereto a preliminary education equivalent to that required for entrance to the junior class of an accredited high school; or, if the applicant has attended such college from which he received his diploma only during the last full course, he shall have received his dental education prior to said last course in a dental college having an equal standard as to course of study and preliminary requirements. An applicant for examination shall be a graduate of a duly incorporated and reputable dental college, or shall have been engaged in the reputable practice of dentistry consecutively for four years immediately preceding his application for examination, or shall have served as an apprentice to a dentist engaged in the reputable practice of dentistry for a period of five years. Graduates of reputable dental colleges in the State who are students therein at the time of the passage of this act (May 21, 1903) shall be licensed without examination.

*Penalty for violation.*—Fine of \$10 to \$100 for each offense. (Wisconsin Statutes, 1898, as amended by act of May 21, 1903.)

WYOMING.

*Requirements for licensure.*—Diploma from a dental college recognized by the National Association of Dental Examiners. Must be filed with county clerk, who files same and issues certificate.

*Penalty for violation.*—Fine of \$50 to \$200 or sixty days in jail, or both. (Revised Statutes, 1899, secs. 2207-2212.)

---

SUMMARY OF REQUIREMENTS FOR THE PRACTICE OF DENTISTRY.

1. *Require an examination.*—Alabama, Arizona, California, Colorado, Connecticut, Delaware, Florida, Georgia, Idaho, Iowa, Maine, Massachusetts, Minnesota, Mississippi, New Hampshire, New Jersey (license of other State board requiring an examination may be accepted), New York, North Carolina, Ohio, Oregon, Pennsylvania, Rhode Island, South Carolina, Utah, Vermont, Washington, West Virginia (27).

(a) Of the above (1), the following require a reputable diploma of applicants for examination: Colorado, Iowa, Minnesota, Ohio, Oregon, Washington (6).

(b) Of the above (1), the following require of applicants for examination a diploma, or, in lieu thereof, a certain period of apprenticeship and a high school education, or license of another State board: Arizona, California (2).

(c) Of the above (1), the following requires of applicants for examination a diploma, or, in lieu thereof, a certain period of practice or instruction under a dentist: Connecticut.

(d) Of the above (1), the following requires of applicants for examination a diploma, or, in lieu thereof, a license after examination by another State board: Georgia.

(e) Of the above (1), the following requires of applicants for examination a diploma, or, in lieu thereof, three years' apprenticeship or license of another State: Idaho.

(f) Of the above (1), the following requires of applicants for examination a diploma, or, in lieu thereof, two years' practice or three years' study under a dentist: Utah.

(g) Of the above (1), the following requires of applicants for examination a common school education and either a diploma or the recommendation of five dentists, or a diploma or license to practice in a foreign country: New Jersey.

(h) Of the above (1), the following requires of applicants for examination a high school education and either a diploma of a registered dental college or a diploma or license to practice in a foreign country: New York.

(i) Of the above (1), the following requires of applicants for examination a diploma of a dental college or a diploma or license to practice in a foreign country: Pennsylvania.

(a) South Dakota requires three years' practice or apprenticeship of applicants for examination.

3. *Requires a diploma.*—Wyoming (1).

## CHAPTER I.

### GENERAL LAWS RELATING TO AGRICULTURAL AND MECHANICAL LAND GRANT COLLEGES.

---

#### ACTS OF CONGRESS.

AN ACT donating public lands to the several States and Territories which may provide colleges for the benefit of agriculture and the mechanic arts.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That there be granted to the several States, for the purposes hereinafter mentioned, an amount of public land, to be apportioned to each State a quantity equal to 30,000 acres for each Senator and Representative in Congress to which the States are respectively entitled by the apportionment under the census of 1860: *Provided,* That no mineral lands shall be selected or purchased under the provisions of this act.

SEC. 2. *And be it further enacted,* That the land aforesaid, after being surveyed, shall be apportioned to the several States in sections or subdivisions of sections, not less than one-quarter of a section; and wherever there are public lands in a State, subject to sale at private entry at one dollar and twenty-five cents per acre, the quantity to which said State shall be entitled shall be selected from such lands, within the limits of such State; and the Secretary of the Interior is hereby directed to issue to each of the States, in which there is not the quantity of public lands subject to sale at private entry, at one dollar and twenty-five cents per acre, to which said State may be entitled under the provisions of this act, land scrip to the amount in acres for the deficiency of its distributive share; said scrip to be sold by said States, and the proceeds thereof applied to the uses and purposes prescribed in this act, and for no other use or purpose whatsoever: *Provided,* That in no case shall any State to which land scrip may thus be issued be allowed to locate the same within the limits of any other State, or of any territory of the United States; but their assignees may thus locate said land scrip upon any of the unappropriated lands of the United States subject to sale at private entry at one dollar and twenty-five cents, or less, an acre: *And provided further,* That not more than one million acres shall be located by such assignees in any one of the States: *And provided further,* That no such location shall be made before one year from the passage of this act.

SEC. 3. *And be it further enacted,* That all the expenses of management, superintendence and taxes from date of selection of said lands, previous to their sales, and all expenses incurred in the management and disbursement of moneys which may be received therefrom, shall be paid by the States to which they may belong, out of the Treasury of said States, so that the entire proceeds of the sale of said lands shall be applied, without any diminution whatever, to the purposes herein-after mentioned.

SEC. 4. *And be it further enacted,* That all moneys derived from the sale of the lands aforesaid by the States to which the lands are apportioned, and from the sales of land scrip hereinbefore provided for, shall be invested in stocks of the United States, or of the States, or some other safe stocks, yielding not less than five per centum upon the par value of said stocks; and that the moneys so invested shall constitute a perpetual fund, the capital of which shall remain forever undiminished, except so far as may be provided in section fifth of this act, and the interest of which shall be inviolably appropriated, by each State which may take and claim the benefit of this act, to the endowment, support, and maintenance of, at least, one college, where the leading object shall be, without excluding other scientific and classical studies, and including military tactics, to teach such branches of learning as are related to agriculture and the mechanic arts, in such

manner as the Legislatures of the States may respectively prescribe, in order to promote the liberal and practical education of the industrial classes in the several pursuits and professions in life.

SEC. 5. *And be it further enacted*, That the grant of land and land scrip hereby authorized shall be made on the following conditions, to which, as well as to the provisions hereinbefore contained, the previous assent of the several States shall be signified by legislative acts:

*First*, If any portion of the fund invested, as provided by the foregoing section, or any portion of the interest thereon, shall, by any action or contingency, be diminished or lost, it shall be replaced by the State to which it belongs, so that the capital of the fund shall remain forever undiminished; and the annual interest shall be regularly applied without diminution to the purposes mentioned in the fourth section of this act, except that a sum, not exceeding ten per centum upon the amount received by any State under the provisions of this act, may be expended for the purchase of lands for sites or experimental farms, whenever authorized by the respective Legislatures of said States;

*Second*, No portion of said fund, nor the interest thereon, shall be applied, directly or indirectly, under any pretense whatever, to the purchase, erection, preservation, or repair of any building or buildings;

*Third*, Any State which may take and claim the benefit of the provisions of this act shall provide, within five years, at least not less than one college, as prescribed in the fourth section of this act, or the grant to such State shall cease; and said State shall be bound to pay the United States the amount received of any lands previously sold, and that the title to purchasers under the State shall be valid;

*Fourth*, An annual report shall be made regarding the progress of each college, recording any improvements and experiments made, with their costs and results, and such other matters, including State industrial and economical statistics, as may be supposed useful; one copy of which shall be transmitted by mail free, by each, to all the other colleges which may be endowed under the provisions of this act, and also one copy to the Secretary of the Interior;

*Fifth*, When lands shall be selected from those which have been raised to double the minimum price in consequence of railroad grants, they shall be computed to the States at the maximum price, and the number of acres proportionally diminished;

*Sixth*, No State, while in a condition of rebellion or insurrection against the government of the United States, shall be entitled to the benefit of this act;

*Seventh*, No State shall be entitled to the benefits of this act unless it shall express its acceptance thereof by its Legislature within two years from the date of its approval by the President.

SEC. 6. *And be it further enacted*, That land scrip issued under the provisions of this act shall not be subject to location until after the first day of January, 1863.

SEC. 7. *And be it further enacted*, That land officers shall receive the same fees for locating land scrip issued under the provisions of this act as is now allowed for the location of military bounty land warrants under existing laws: *Provided*, That maximum compensation shall not be thereby increased.

SEC. 8. *And be it further enacted*, That the Governors of the several States to which scrip shall be issued under this act shall be required to report annually to Congress all sales made of such scrip until the whole shall be disposed of, the amount received for the same, and what appropriation has been made of the proceeds. (Approved, July 2, 1862.)

AN ACT To establish agricultural experiment stations in connection with the colleges established in the several States under the provisions of an act approved July second, eighteen hundred and sixty-two, and of the acts supplementary thereto.

SECTION 1. *Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled*, That in order to aid in acquiring and diffusing among the people of the United States useful and practical information on subjects connected with agriculture, and to promote scientific investigation and experiment respecting the principles and applications of agricultural science, there shall be established, under direction of the college or colleges, or agricultural department of colleges, in each State or Territory established, or which may hereafter be established in accordance with the provisions of an act approved July second, eighteen hundred and sixty-two, entitled "An act donating public lands to the several states and territories which may provide colleges for the benefit of agriculture and the mechanic arts," or any of the supplements of said act, a department to be known and designated as an "agricultural experiment station:" *Provided*, That in any State or Territory in which two such colleges have been or may be so established, the appropriation hereinafter made to such State or Territory

shall be equally divided between such colleges, unless the legislature of such state or territory shall otherwise direct.

SEC. 2. That it shall be the object and duty of said experiment stations to conduct original researches or verify the experiments on the physiology of plants and animals; the diseases to which they are severally subject, with the remedies for the same; the chemical composition of useful plants at their different stages of growth; the comparative advantages of rotative cropping as pursued under a varying series of crops; the capacity of new plants or trees for acclimation; the analysis of soils and water; the chemical composition of manures, natural or artificial, with experiments designed to test their comparative effects on crops of different kinds; the adaptation and value of grasses and forage plants; the composition and digestibility of the different kinds of food for domestic animals; the scientific and economic questions involved in the production of butter and cheese; and such other researches or experiments bearing directly on the agricultural industry of the United States as may in each case be deemed advisable, having due regard to the varying conditions and needs of the respective States or Territories.

SEC. 3. That in order to secure as far as practicable uniformity of methods and results in the work of said stations it shall be the duty of the United States commissioner of agriculture to furnish forms, as far as practicable, for the tabulation of results of investigation or experiments; to indicate, from time to time, such lines of inquiry as to him shall seem most important; and in general, to furnish such advice and assistance as will best promote the purposes of this act. It shall be the duty of each of said stations annually, on or before the first day of February, to make to the governor of the State or Territory in which it is located, a full and detailed report of its operations, including a statement of receipts and expenditures, a copy of which report shall be sent to each of said stations, to the said commissioner of agriculture, and to the secretary of the treasury of the United States.

SEC. 4. That bulletins or reports of progress shall be published at said stations at least once in three months, one copy of which shall be sent to each newspaper in the States and Territories in which they are respectively located, and to such individuals actually engaged in farming as may request the same, and as far as the means of the station will permit. Such bulletins or reports, and the annual reports of said stations, shall be transmitted in the mails of the United States free of charge for postage, under such regulations as the postmaster general may from time to time prescribe.

SEC. 5. That for the purpose of paying the necessary expenses of conducting investigations and experiments, and printing and distributing the results as hereinbefore prescribed, the sum of \$15,000 is hereby appropriated to each State to be specially provided for by Congress in the appropriations from year to year, and to each territory under the provisions of section eight of this act, out of any money in the treasury proceeding from the sales of public lands, to be paid in equal quarterly payments on the first day of January, April, July and October in each year, to the treasurer or other officer duly appointed by the governing boards of said colleges to receive the same, the first payment to be made on the first day of October, 1887: *Provided, however,* That out of the first annual appropriation so received by any station an amount not exceeding one-fifth may be expended in the erection, enlargement or repair of a building or buildings necessary for carrying on the work of such station; and thereafter an amount not exceeding five per centum of such annual appropriation may be so expended.

SEC. 6. That whenever it shall appear to the secretary of the treasury from the annual statement of receipts and expenditures of any of said stations, that a portion of the preceding annual appropriation remains unexpended, such amount shall be deducted from the next succeeding annual appropriation to such station, in order that the amount of money appropriated to any station shall not exceed the amount actually and necessarily required for its maintenance and support.

SEC. 7. That nothing in this act shall be construed to impair or modify the legal relation existing between any of the said colleges and the government of the States or Territories in which they are respectively located.

SEC. 8. That in States having colleges entitled under this section to the benefits of this act, and having also agricultural experiment stations established by law separate from said colleges, such States shall be authorized to apply such benefits to experiment stations so established by such States; and in case any State shall have established, under the provisions of said act of July second, aforesaid, an agricultural department or experimental station in connection with any university, college or institution not distinctively an agricultural college or school, and such State shall have established, or shall hereafter establish a separate agricultural college or

school, which shall have connected therewith an experimental farm or station, the Legislature of such State may apply in whole or in part the appropriation by this act made to such separate agricultural college or school; and no Legislature shall, by contract express or implied, disable itself from so doing.

SEC. 9. That the grants of money authorized by this act are made subject to the Legislative assent of the several States and territories to the purpose of said grants: *Provided*, That payment of such installments of the appropriation herein made as shall become due to any State before the adjournment of the regular session of its Legislature meeting next after the passage of this act, shall be made upon the assent of the Governor thereof duly certified to the secretary of the treasury.

SEC. 10. Nothing in this act shall be held or construed as binding the United States to continue any payments from the treasury to any or all the States or institutions mentioned in this act, but Congress may at any time amend, suspend or repeal any or all of the provisions of this act. (Approved, March 2, 1887.)

AN ACT To apply a portion of the proceeds of the public lands to the more complete endowment and support of the colleges for the benefit of agriculture and the mechanic arts established under the provisions of an act of Congress approved July second, eighteen hundred and sixty-two.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled*, That there shall be, and hereby is, annually appropriated, out of any money in the Treasury not otherwise appropriated, arising from the sale of public lands, to be paid as hereinafter provided, to each State and Territory for the more complete endowment and maintenance of colleges for the benefit of agriculture and the mechanic arts now established, or which may be hereafter established, in accordance with an act of Congress approved July second, eighteen hundred and sixty-two, the sum of fifteen thousand dollars for the year ending June thirtieth, eighteen hundred and ninety, and an annual increase of the amount of such appropriation thereafter for ten years by an additional sum of one thousand dollars over the preceding year, and the annual amount to be paid thereafter to each State and Territory shall be twenty-five thousand dollars to be applied only to instruction in agriculture, the mechanic arts, the English language and the various branches of mathematical, physical, natural and economic science, with special reference to their applications in the industries of life, and to the facilities for such instruction: *Provided*, That no money shall be paid out under this act to any State or Territory for the support and maintenance of a college where a distinction of race or color is made in the admission of students, but the establishment and maintenance of such colleges separately for white and colored students shall be held to be a compliance with the provisions of this act if the funds received in such State or Territory be equitably divided as hereinafter set forth: *Provided*, That in any State in which there has been one college established in pursuance of the act of July second, eighteen hundred and sixty-two, and also in which an educational institution of like character has been established, or may be hereafter established, and is now aided by such State from its own revenue, for the education of colored students in agriculture and the mechanic arts, however named or styled, or whether or not it has received money heretofore under the act to which this act is an amendment, the Legislature of such State may propose and report to the Secretary of the Interior a just and equitable division of the fund to be received under this act between one college for white students and one institution for colored students established as aforesaid, which shall be divided into two parts and paid accordingly, and thereupon such institution for colored students shall be entitled to the benefits of this act and subject to its provisions, as much as it would have been if it had been included under the act of eighteen hundred and sixty-two, and the fulfillment of the foregoing provisions shall be taken as a compliance with the provision in reference to separate colleges for white and colored students.

SEC. 2. That the sums hereby appropriated to the States and Territories for the further endowment and support of colleges shall be annually paid on or before the thirty-first day of July of each year, by the Secretary of the Treasury, upon the warrant of the Secretary of the Interior, out of the Treasury of the United States, to the State or Territorial treasurer, or to such officer as shall be designated by the laws of such State or Territory to receive the same, who shall, upon the order of the trustees of the college, or the institution for colored students, immediately pay over said sums to the treasurers of the respective colleges or other institutions entitled to receive the same, and such treasurers shall be required to report to the Secretary of Agriculture and to the Secretary of the Interior, on or before the first day of September of each year, a detailed statement of the amount so received and of its disbursement. The grants of moneys authorized by this act

are made subject to the legislative assent of the several States and Territories to the purpose of said grants: *Provided*, That payments of such installments of the appropriation herein made as shall become due to any State before the adjournment of the regular session of legislature meeting next after the passage of this act shall be made upon the assent of the governor thereof, duly certified to the Secretary of the Treasury.

SEC. 3. That if any portion of the moneys received by the designated officer of the State or Territory for the further and more complete endowment, support, and maintenance of colleges, or of institutions for colored students, as provided in this act, shall, by any action or contingency, be diminished or lost, or be misapplied, it shall be replaced by the State or Territory to which it belongs, and until so replaced no subsequent appropriation shall be apportioned or paid to such State or Territory; and no portion of said moneys shall be applied, directly or indirectly, under any pretense whatever, to the purchase, erection, preservation, or repair of any building or buildings. An annual report by the president of each of said colleges shall be made to the Secretary of Agriculture, as well as to the Secretary of the Interior, regarding the condition and progress of each college, including statistical information in relation to its receipts and expenditures, its library, the number of its students and professors, and also as to any improvements and experiments made under the direction of any experiment stations attached to said colleges, with their costs and results, and such other industrial and economical statistics as may be regarded as useful, one copy of which shall be transmitted by mail free to all other colleges further endowed under this act.

SEC. 4. That on or before the first day of July in each year, after the passage of this act, the Secretary of the Interior shall ascertain and certify to the Secretary of the Treasury as to each State and Territory whether it is entitled to receive its share of the annual appropriation for colleges, or of institutions for colored students, under this act, and the amount which thereupon each is entitled, respectively, to receive. If the Secretary of the Interior shall withhold a certificate from any State or Territory of its appropriation the facts and reasons therefor shall be reported to the President, and the amount involved shall be kept separate in the Treasury until the close of the next Congress, in order that the State or Territory may, if it should so desire, appeal to Congress from the determination of the Secretary of the Interior. If the next Congress shall not direct such sum to be paid it shall be covered into the Treasury. And the Secretary of the Interior is hereby charged with the proper administration of this law.

SEC. 5. That the Secretary of the Interior shall annually report to Congress the disbursements which have been made in all the States and Territories, and also whether the appropriation of any State or Territory has been withheld, and if so, the reasons therefor.

SEC. 6. Congress may at any time amend, suspend, or repeal any or all of the provisions of this act. (Approved, August 30, 1890.)

### ALABAMA.

Constitution, 1875, Article XIII: SECTION 1. The general assembly shall establish, organize, and maintain a system of public schools throughout the State for the equal benefit of the children between the ages of 7 and 21 years, but separate schools shall be provided for the children of citizens of African descent. [This provision of the constitution is inserted here, as upon it a claim was based for the establishment of a "University for Colored People."]

SEC. 2. The principal of all funds arising from the sale or other disposition of lands or other property which has been or may hereafter be granted or intrusted to this State, or given by the United States for educational purposes, shall be preserved inviolate and undiminished; and the income arising therefrom shall be faithfully applied to the specific objects of the original grants or appropriations.

SEC. 3. All lands or other property \* \* \* appropriated by the State for educational purposes \* \* \* shall be faithfully applied to the maintenance of the public schools.

SEC. 8. No money raised for the support of the public schools of the State shall be appropriated to, or used for, the support of any sectarian or denominational school.

SEC. 9. The State university and the agricultural and mechanical college shall each be under the management and control of a board of trustees. \* \* \* The board for the agricultural and mechanical college shall consist of two members from the Congressional district in which the college is located, and one from each

of the other Congressional districts in the State. Said trustees shall be appointed by the governor, by and with the advice and consent of the senate, and shall hold office for a term of six years, and until their successors shall be appointed and qualified. After the first appointment each board shall be divided into three classes, as nearly as may be. The seats of the first class shall be vacated at the expiration of two years, and those of the second class in four years, and those of the third class at the end of six years from the date of appointment, so that one-third may be chosen biennially. No trustee shall receive any pay or emolument other than his actual expenses incurred in the discharge of his duties as such. The governor shall be ex-officio president, and the superintendent of education ex-officio member of \* \* \* said board of trustees.

SEC. 10. The general assembly shall have no power to change the location of the \* \* \* agricultural and mechanical college, as now established by law, except upon a vote of two-thirds of the members of the general assembly, taken by yeas and nays, and entered upon the journal.

Article IV, Legislative Department: The legislative department [of Alabama] shall be vested in a general assembly, which shall consist of a senate and house of representatives.

SEC. 33. No money shall be paid out of the treasury except upon appropriations made by law, and on warrant drawn by the proper officer in pursuance thereof; and a regular statement and account of receipts and expenditures of all public moneys shall be published annually.

[The following matter is taken from the official work entitled "The Code of Alabama, with such statutes passed at the session of 1896-97 as are required to be incorporated therein."—Atlanta, Ga., 1897.]

Code of Alabama (1897), article 14: SEC. 3636. Incorporation of the college. The governor and the superintendent of education, by virtue of their respective offices, and the trustees appointed from the different Congressional districts of the States, under the provisions of section 9 of Article XIII of the constitution, and their successors in office, are constituted a body corporate under the name of the Agricultural and Mechanical College of Alabama, to carry into effect the purpose and intent of the Congress of the United States in the grant of lands by the act of July 2, 1862.

SEC. 3687. General powers, duties, and liabilities of college. Such corporation shall have all the rights, privileges, and franchises necessary to a promotion of the end of its creation, and shall be charged with all corresponding duties, liabilities, and responsibilities.

SEC. 3688. Credit of State pledged to payment of interest. For the payment of the interest, at the rate of 8 per cent per annum, on the fund of \$353,500, arising from the sale of the scrip for the land donated in trust to this State by the act of Congress of July 2, 1862, the faith and credit of the State are forever pledged.

SEC. 3689. Powers of board of trustees. The board of trustees have the power to organize the college by appointing a corps of instructors, who shall be styled the faculty of the college, and such other instructors and officers as the interest of the college may require; and to remove any such instructors or officers, and to fix their salaries or compensation, and increase or reduce the same at their discretion; to regulate, alter, or modify the government of the college as they may deem advisable; to prescribe courses of instruction, rates of tuition, and fees; to confer such academic and honorary degrees as are usually conferred by institutions of similar character; and to do whatever else they may deem best for promoting the interest of the college. They shall also establish and maintain a military department in the college, and elect a commandant and such other officers as may be necessary for the department.

SEC. 3690. Classification of trustees. The trustees of the college are divided into three classes, as follows: The trustees from the fourth, fifth, seventh, and ninth districts shall constitute the first class; those from the eighth, sixth, and second districts shall constitute the second class, and those from the third and first districts shall constitute the third class; and they shall hold office and their seats be vacated as prescribed by the constitution.

SEC. 3691. Any vacancy in the office of trustee occurring during the recess of the legislature shall be filled by appointment of the governor, such appointee to hold until, at the next session of the legislature thereafter, such vacancy shall be filled by the governor, by and with the consent of the senate; and any trustee appointed to fill a vacancy by the governor, by and with the consent of the senate, shall hold during the unexpired term.

SEC. 3692. Time and place of meeting of trustees. The board of trustees shall hold their meetings at the seat of the college on the last Monday in June of each

year, unless the board shall in regular session determine to hold its meetings at some other time and place; and upon the application in writing of any four members of the board the governor shall appoint a special meeting, naming the time and place thereof, and cause notices thereof to be issued to the several members of the board, but such meeting shall not be appointed for a day less than twenty days subsequent to the date of the notice.

SEC. 3693. Quorum of board of trustees. Six members of the board of trustees shall constitute a quorum, but a smaller number may adjourn from day to day until a quorum is present.

SEC. 3694. The certificate of the president of the board or in his absence of the president pro tempore, countersigned by the secretary, shall entitle the several trustees to the payment of their actual expenses incurred in the discharge of their duties as such trustees.

SEC. 3695. No grant or gift, by will or otherwise, shall fail on account of any misnomer or informality, when the intent of the grantor or donor can be arrived at; nor shall any default, malfeasance, or misfeasance, or nonuser on the part of the trustees or other officers or agents of such corporation, work a forfeiture of any of its rights, privileges, powers, or franchises.

SEC. 3696. It shall be the duty of the board of trustees to make or cause to be made to the general assembly, at each session thereof, a full report of their transactions, and of the condition of the college, embracing an itemized account of all receipts and disbursements on account of the college by those charged with the administration of its finances.

SEC. 3697. Interest paid by treasurer; when bond required of officers or agents. The State treasurer must pay the interest on the fund of \$253,560 arising from the sale of land scrip quarterly, as the same may accrue, to the treasurer or other authorized agent or officer of the college; and on the application of such treasurer, agent, or officer, the auditor shall draw his warrant on the State treasurer for such interest; but in no case shall any person be authorized to receive, hold, or disburse any fund of the college without having first given bond conditioned for the faithful performance of his duties.

SEC. 398. Experiment station of agricultural and mechanical college. The trustees of the agricultural and mechanical college may establish and maintain an agricultural experiment station, at which careful experiments in scientific agriculture shall be made: the results whereof shall be furnished the commissioner [of agriculture] monthly, and he shall make publication thereof as often as he may deem necessary: and if such station is established and maintained, the trustees of the college shall cause, without charge therefor, an analysis to be made of all fertilizers submitted by the commissioner for analysis; and one-sixth of the net proceeds arising from the sale of fertilizer tags shall be paid quarterly to the treasurer of the agricultural and mechanical college on the approval of the governor and of the commissioner, to be disbursed under the direction of the board of trustees for the development of the agricultural and mechanical department of the college.

SEC. 399. A branch agricultural experiment station, for the purpose of conducting and making experiments in scientific agriculture, is established and located at or near Uniontown, in Perry County, known as the Canebrake Agricultural Experiment Station.

SEC. 400. The station is under the general supervision and control of a board composed of the commissioner of agriculture, the director of the experiment station at the agricultural and mechanical college, and five progressive farmers to be appointed by the governor, who are actually engaged in cultivating canebrake land, three of whom must reside within 10 miles of the station, and who must not receive any compensation other than expenses actually incurred in visiting the station, and, while there, supervising its affairs.

SEC. 401. The board has authority to purchase suitable lands, not exceeding in quantity 40 acres, for the use of the station, taking the title to the State, and to construct thereon the necessary buildings and other improvements, not expending more than \$2,000 in making such purchase and in the construction of such buildings and improvements. The board has authority also to appoint and to discharge at pleasure such officers, agents, or servants as are deemed necessary to the operation of the station, fixing their compensation: and may appoint a director to conduct and control the operations of the station, under the superintendence and direction and subject to the rules and regulations of the board, and may pay such director a reasonable salary, not to exceed \$250 per annum.

SEC. 402. The board must cause such experiments to be made at the station as will advance the interests of scientific agriculture, particularly on canebrake lands, and to cause such chemical analyses to be made as are deemed necessary,

all such analyses, if requested, to be made under the supervision of the commissioner of agriculture by the chemist of the agricultural department without charge.

SEC. 403. The expenses of the canebrake agricultural experiment station, not exceeding \$2,500 annually, must be paid out of the funds of the agricultural department to the treasurer of the board of control in equal quarterly installments on the 1st days of January, April, July, and October.

SEC. 404. A branch agricultural experiment station and school is established at Athens, Limestone County, in the Eighth Congressional district, known as the North Alabama Agricultural Experiment Station and School; another at Abbeville, Henry County, in the Third Congressional district, known as the Southeast Alabama Agricultural Experiment Station and School; another at Albertville, Marshall County, in the Seventh Congressional district, known as the Northeast Alabama Agricultural Experiment Station and School; another at Evergreen, Conecuh County, in the Second Congressional district, known as the Southwest Alabama Agricultural Experiment Station and School; another at Hamilton, Marion County, in the Sixth Congressional district, known as the Sixth District Agricultural Experiment Station and School; another at Blountsville, Blount County, in the Ninth Congressional district, known as the Ninth District Agricultural Experiment Station and School; and three additional agricultural experiment stations and schools, to be located by the governor, commissioner of agriculture, and superintendent of education, may be established in the First, Fourth, and Fifth Congressional districts, respectively, to be known as the — District Agricultural Experiment Station and School, respectively, whenever the inhabitants of the district shall convey to the State for the use of such stations and schools, respectively, not less than 80 acres of land, with suitable school buildings thereon of not less than \$5,000 in value as approved by the commissioner of agriculture. [On the 9th of December, 1896, the foregoing was amended as follows:] No school or experiment station shall be established in either [any?] of said Congressional districts until such district or the citizens thereof shall donate and convey to the State for the use of such station and school real estate and buildings not less than \$5,000 in value, to be approved by the commissioner of agriculture: *Provided, etc.*, [The matter being local in application and of detail.]

SEC. 405. Each of such stations is under the supervision of a board of control, appointed by the governor, to be composed of five members, a majority of whom shall be men whose principal business is farming, who shall be residents of the respective Congressional district wherein the school for which they are appointed is located, and the superintendent of education and the commissioner of agriculture shall be ex officio members of such board of control. Such board of control may appoint an executive committee composed of not less than three members of such board, who shall exercise such powers consistent with the acts creating the said school as are conferred upon them by the board of control. Of the five members of each board of control appointed by the governor, one shall be appointed for two years, two for four years, and two for six years from the date of their respective appointments, and as their terms expire the governor shall fill the vacancies, and the members appointed to fill such vacancies shall hold for six years from their appointments. And the governor, whenever he deems such action necessary or expedient, shall have authority to remove the board of control of any school or any member of such board. The members of said board must not receive any compensation other than traveling expenses actually incurred in attending meetings of the board of control.

SEC. 406. For the support of the nine branch agricultural schools and experiment stations, located in the First, Second, Third, Fourth, Fifth, Sixth, Seventh, Eighth, and Ninth Congressional districts, respectively, in the State of Alabama, there shall be appropriated annually out of the agricultural fund the sum of \$2,500 to each of said schools, one-fourth of such sum to be paid quarterly, to wit, January 1, April 1, July 1, and October 1 of each year, to the treasurer of the board of control of such schools, provided there is so much of said fund not otherwise appropriated; and if such fund is not sufficient to pay to each of said schools the said sum of \$2,500, then the same is to be equally divided among said schools.

SEC. 407. Not less than \$500 of the sum so appropriated to each of said schools shall be used in maintaining, cultivating, and improving the farms, respectively, and making agricultural experiments thereon, under and by direction of the respective boards of control.

SEC. 408. The treasurer of the board of control shall give bond payable to the board of control, in the sum of at least \$1,000, conditioned to faithfully keep and disburse the funds of the schools, and such board of control may require an additional bond at any time it may deem necessary.

SEC. 409. The president or principal of each of said schools shall be the director of the respective school and station in which he is employed, and he shall personally superintend the making of such experiments as will advance the interests of scientific agriculture and cause such chemical analyses to be made as are deemed necessary, and perform such other duties in reference to such experiment stations as shall be required of him by the board of control.

SEC. 410. The president and board of control of said agricultural schools and experiment stations shall, from time to time, prepare bulletins of information for farmers and reports of agricultural experiments conducted by them and answers to questions that may be asked them in practical farming and veterinary diseases, including condensed reports of the experiment station at Uniontown, and publish the same in all the weekly newspapers published in their respective Congressional districts whose publishers will insert the same free of charge.

SEC. 411. It shall be the duty of the president or principal of each of said schools to make to the superintendent of education, on or before September 30 of each year, a full report of the financial condition, workings, and progress of said school, embracing an itemized account of all receipts and disbursements of money appropriated to such schools by this article, and a like report to the commissioner of agriculture of the condition, expenses, and workings of the experiment station connected with such school.

SEC. 412. It shall be the duty of the president and principal of each of such schools to report in writing quarterly to the board of control an itemized account of all incidental or matriculation fees, and all other moneys received by him as such president or principal, together with the disposition of the same. He shall give receipts for all moneys received and take receipts for all moneys disbursed by him.

SEC. 413. Scientific and practical agriculture shall be taught at all the agricultural schools, and all male pupils over 10 years of age who receive free tuition therein shall be required to take the course in scientific agriculture and horticulture, and all other pupils over the age of 10 years receiving free tuition shall be required to take the course in floriculture and horticulture.

SEC. 414. None of the said schools shall receive the appropriations provided for in this article or any part thereof unless such school shall be actually conducting an agricultural experiment station and agricultural school, wherein such experiments are made as will tend to advance the interests of scientific farming.

SEC. 415. The board of control and president of the faculty of said schools shall adopt a course of study with a view to educating and training pupils for teachers in the public schools of this State, which course of study shall embrace the different grades adopted by the State; to grant certificates of proficiency or diplomas to such pupils as shall complete the course of study so adopted: *Provided*, That such certificates of proficiency or diplomas shall not entitle the holder to teach in the public schools of the State without examination.

SEC. 416. The commissioner [of agriculture] is authorized and directed to adopt annually such measures as may be necessary to successfully conduct in different sections of the State farmers' institutes, consisting of lectures on subjects related to agriculture by persons of scientific attainments, and by practical and successful farmers, with discussions relating thereto, and of such exhibitions as may be found improving, instructive, and of practical value to the farmers of the vicinity where such institutes are held, a report of which, with a detailed statement of the money expended in that connection, must be embodied in his annual report.

SEC. 417. The commissioner is authorized to pay the necessary expenses incurred in conducting such farmers' institutes, including the expense of employing lecturers when necessary and for distributing the reports thereof, and for this purpose there is annually appropriated out of the funds of the department of agriculture \$3,000, or so much thereof as may be necessary, to be paid from the monthly estimate and allowance for expenses of the department.

SEC. 396. All moneys received by the department from fees for licenses, from sales of tags, from fees for the registration of lands for sale, or from any other source must be paid into the State treasury monthly.

Act approved February 15, 1897:

SECTION 1. A branch agricultural experiment station and agricultural school for the colored race is hereby established and located at Tuskegee, Macon County, to be run in connection with the Tuskegee Normal and Industrial Institute, and to be known as the Tuskegee Agricultural Experiment Station and Agricultural School.

SEC. 2. The board of control of said station and school shall be composed of the State commissioner of agriculture, the president of the Agricultural and Mechanical College, and the director of the State experiment station at Auburn,

Ala., and the members of the board of trustees of the Tuskegee Normal and Industrial Institute who reside in the town of Tuskegee, and their successors, who shall also reside in the town of Tuskegee, Ala. The members of said board shall not receive any compensation other than expenses actually incurred in visiting the station and school and while there supervising its affairs.

SEC. 3. The said board of control shall have power to elect the director, teachers, and such other officers, agents, and servants as are deemed necessary to the operation of the said station and school, fixing their compensation, and shall manage said school and station as in their judgment they think best.

SEC. 4. For the equipment and improvement of said station and school there is hereby appropriated out of the agricultural fund in the treasury, not otherwise appropriated, the sum of \$1,500, one-fourth of said sum to be paid quarterly to the treasurer of said board of control, who shall give bond in double the amount of the appropriation, for the safe-keeping and faithful application of the sum appropriated, the bond to be approved by the judge of probate of Macon County and filed in his office, a certified copy of which shall be forwarded to the commissioner of agriculture, to be placed on file in his office.

SEC. 5. The trustees of the said Tuskegee Normal and Industrial Institute shall furnish for the use of said station and school all the necessary lands and buildings, and for such use they shall make no charge against the State of Alabama.

SEC. 6. The board of control must cause such experiments to be made at said station as will advance the interest of scientific agriculture, and must cause such chemical analyses to be made as are deemed necessary. All such analyses, if requested, are to be under the supervision of the commissioner of agriculture by the chemist of the agricultural department without charge.

SEC. 7. The board of control may adopt such rules and regulations as they may deem necessary for the purpose of carrying out the provisions of this act, so that the colored race may have the opportunity of acquiring an intelligent and practical knowledge of agriculture in all its various branches.

SEC. 8. It is the purpose of this act to appropriate to the support of the experiment station established by this act; the sums appropriated in this act are appropriated only for the purpose of maintaining and operating experimental stations with the view of educating and training colored students, as herein named, in scientific agriculture.

SEC. 9. The Alabama State Normal School for Colored Students, at Montgomery, is hereby constituted an experiment station and shall be under its present board of trustees, and \$1,000 per annum is hereby appropriated out of the treasury to the credit of the agricultural department, not otherwise appropriated, for the purpose of operating an experiment station in connection with said Alabama State Normal School for Colored Students, at Montgomery.

Act approved February 13, 1891.

SECTION 1. Inasmuch as by the act of Congress for the more complete endowment and support of the colleges for the benefit of agriculture and the mechanic arts, approved August 30, 1890, the grants of money authorized by said act are made subject to the legislative assent of the several States and Territories to the purpose of said grants, it is hereby declared that the assent of the general assembly of the State of Alabama is given to the purpose of the grants made in said act of Congress; and the trustees of the institution receiving said grants are hereby directed to comply with the terms and conditions expressed in the act aforesaid, using all moneys received under said act of Congress faithfully for the purposes named therein.

SEC. 2. The division of the fund to be received under said act approved August 30, 1890, between one college for white students and one institution for colored students shall be based from year to year upon the ratio of the number of each race of legal school age to the population of school age in the State of Alabama, as shown by the State school census next preceding the annual payment of said fund by the United States Treasury, said ratio being, for the year 1888-9, white (56.6) fifty-six and six-tenths per cent, colored (43.4) forty-three and four-tenths per cent; it being provided that the division may be at any time modified by the written consent of the Secretary of the Interior of the United States and the governor of Alabama.

SEC. 3. That portion of the grant of money received by the State of Alabama under said act of Congress approved August 30, 1890, herein set apart for the education of white students, is appropriated to the Agricultural and Mechanical College of Alabama, at Auburn, and that portion of the said grant herein set apart

for the education of colored students is appropriated to the Huntsville State Colored Normal and Industrial School.

SEC. 4. That the money appropriated in this act to the Agricultural and Mechanical College, at Auburn, and to the Huntsville State Colored Normal and Industrial School shall be drawn from the State treasury, as ordered by the trustees of the said institutions, on the warrant of the auditor, approved by the governor. (Approved February 13th, 1891.)

## ARIZONA.

[The following matter is taken from the Revised Statutes of Arizona Territory, 1901.]

SEC. 3625. There shall be established in this Territory, at or near the city of Tucson, in the county of Pima, upon the grounds secured for that purpose, in the manner hereinafter provided, an institution of learning under the name of the "University of Arizona."

SEC. 3626. The object of the university shall be to provide the inhabitants of this Territory with the means of acquiring a thorough knowledge of the various branches of literature, science, and the arts.

SEC. 3627. The government of the university shall vest in a board of regents, to consist of a president and three members, who shall be appointed as hereinafter provided, and the Territorial superintendent of public instruction and the governor of the Territory shall, during their respective terms of office, be members of said board.

SEC. 3628. The members of the board of regents shall be appointed by the governor of the Territory, by and with the advice and consent of the council, two-thirds of the members of council concurring therein, and shall hold their offices, respectively, except those appointed to the first board, for the term of four years from the first Monday of August succeeding their appointment and until the appointment of a successor.

SEC. 3630. The regents of the university and their successors in office shall constitute a body corporate with the name and style of the "Board of regents of the University of Arizona," and by that name they and their successors shall be known in law; have perpetual succession; may sue and be sued; may purchase, receive, and hold property, real and personal, for the benefit of the Territory of Arizona and the use of said university; of contracting and being contracted with; of making and using a common seal, and altering the same at pleasure.

SEC. 3631. Before entering upon the discharge of the duties of regent each of the members of said board of regents shall execute a bond, with two or more sufficient sureties, to be approved by the governor, in the penal sum of \$5,000, and take and subscribe an oath of office similar to the oath required of other Territorial officers, which bond and oath shall be filed and kept in the office of the Territorial treasurer.

SEC. 3632. The regents shall appoint a secretary, a treasurer, and a librarian, each of whom shall hold office during the pleasure of the board. It shall be the duty of the secretary to record all the proceedings of the board, and carefully to preserve all its books and papers, and to perform such other duties pertaining to his office as the board of regents may from time to time require. The treasurer shall keep a true and faithful account of all moneys received and paid out by him, and shall give such bonds for the faithful performance of the duties of his office as the board of regents may require. The board of regents shall appoint one of its members treasurer and one of its members secretary, but no one member shall be appointed to both the said offices of treasurer and secretary. The secretary shall receive in full for all compensation as such secretary the sum of \$15 per month. No compensation shall be paid to the treasurer.

SEC. 3633. The board of regents shall have power, and it shall be their duty, to enact laws for the government of the university; to elect a chancellor, who shall be ex officio president of the board of regents, and when the chancellor is absent from any meeting of the board, the board may appoint a president pro tem.; they may also appoint and employ the requisite number of professors and tutors, and such other officers and employees as they may deem expedient, and they shall also determine the amount of their respective salaries.

SEC. 3634. The university shall consist of five departments:

1. The department of science, literature, and the arts.
2. The department of theory and practice, and elementary instruction.
3. The department of agriculture.
4. The normal department.
5. The department of mineralogy and school of mines.

The immediate government of the several departments shall be intrusted to their respective faculties, but the board of regents shall have the power to regulate the course of instruction, and prescribe, under the advice of the holders of the professorships, the books to be used and authorities to be followed in the several departments, and also to confer such degrees and grant such diplomas as are usually conferred and granted by other universities.

SEC. 3635. The board of regents shall have power to remove any officer or employee connected with the institution, other than the chancellor or member of the board of regents, when, in their judgment, the interests of the university require it.

SEC. 3636. The fee of admission to the university shall never exceed the sum of \$20, and the charge for tuition in any of the departments shall never exceed in one year, to the residents of the Territory, \$50, and as soon as the increase of the university fund will permit, the tuition in the first and second departments shall be without charge to all students in the same who are residents of the Territory.

SEC. 3637. The board of regents are authorized to expend such portion of the income of the university fund and the funds hereinafter provided for said university as they may deem expedient for the erection of suitable buildings upon the grounds hereinafter provided for, and the purchase of apparatus, a library, and cabinet of natural history and mineralogy.

SEC. 3638. The board of regents shall make a report annually to the governor of the Territory on or before the 2d day of January of each year, exhibiting the state and progress of the university in its several departments, the course of study followed, the number of professors employed and of students in attendance, the amount of receipts and expenditures, and such other information as they may deem proper. Meetings of the board may be called in such manner as the board of regents may prescribe, and any two of them, with the chancellor, at a meeting regularly called, shall be a quorum for the transaction of business, and a less number may adjourn from time to time. No sectarian tenets, opinions, doctrines, or principles shall be taught in any of the departments of said university, nor shall adhesion to any sectarian tenet or opinion be required to entitle any person to be admitted as a student in said university, and no such tenets or opinions shall be required as a qualification for any person as a regent, tutor, or professor of such university.

SEC. 3639. The compensation of said board of regents shall be \$5 per day each for each day's actual attendance upon said board, and 10 cents per mile for each mile actually traveled to and from the place of meeting: *Provided*, That only one mileage shall be allowed each member for each session: *And provided*, That no member of said board shall receive compensation in any one year exceeding the sum of \$150.

SEC. 3640. For the support of said university, in addition to the provisions hereinbefore made, there shall be, and is hereby, appropriated the proceeds from the sale of all lands that have been or may hereafter be granted by the United States to the Territory for university purposes, or of any moneys granted by the same for like purposes, and the proceeds of all lands, money, or other property given by individuals or appropriated by the Territory for the like purpose, all of which shall be and remain a perpetual fund, the interest or income of which, together with the rents of all such lands as may remain unsold, shall be inviolably appropriated and annually applied to the specific object of the original gift, grant, or appropriation; and no such money, property, or proceeds shall under any pretense be applied, used, or loaned for any uses or purposes whatsoever.

SEC. 3642. There shall be a Territorial museum for the collection and preservation of the archaeological resources, specimens of the mineral wealth, and the flora and fauna of the Territory.

SEC. 3643. The regents of the university shall direct and manage the affairs of the museum.

SEC. 3644. There shall be set apart in the rooms of the Territorial university a sufficient amount of space to accommodate such articles as may be received for the Territorial museum, which shall be under the direct supervision of the board of regents of the university.

SEC. 3649. Whenever hereafter any student of the University of Arizona shall be expelled by the faculty or board of regents of said university, the said student so expelled shall be required to give up to the said board of regents his cadet's uniform.

SEC. 3650. The board of regents is authorized, and is hereby required, upon the surrender of the cadet's uniform by any student or cadet expelled, to pay, out of any moneys on hand in the "University of Arizona fund" not otherwise appro-

priated, the cost price of said uniform, the money to be paid to the parent or guardian of said student or cadet.

SEC. 3651. Any student or cadet of said University of Arizona who has been expelled from the said university and after said expulsion is found wearing a cadet's uniform in any public place is guilty of a misdemeanor, and on conviction therefor subject to a fine of not less than \$10 and, in default of the payment of the fine, to five days' imprisonment in the county jail.

SEC. 3652. There shall be levied annually, in addition to all other taxes directed to be levied and collected, a tax of three-fifths instead of two-fifths of a mill, as heretofore provided by law, on each \$1 of assessed value of all real and personal property in the Territory of Arizona, and, when collected, to be placed by the Territorial treasurer in the fund known as the university fund. The Territorial auditor shall certify the rate of tax as above stated to the several boards of supervisors throughout the Territory, and said board of supervisors are hereby directed and required to enter such rate on the assessment rolls of their respective counties in the same manner and with the same effect as is provided by law in relation to other Territorial or county taxes. The tax levied under the authority of the provisions of this act is hereby made a lien against the property assessed, which lien shall attach on the first Monday in February in each year, and shall not be satisfied or removed until such tax is paid.

SEC. 3653. The board of regents of the University of Arizona are authorized to expend such portion of the university fund and such other funds as may be provided for the said university as they may deem expedient for the erection and furnishing of suitable buildings and the support and maintenance of said university.

SEC. 3654. The Territorial auditor is hereby authorized and directed to draw his warrant on the Territorial treasurer for all claims approved and allowed by the said board of regents under the provisions of this act, and the Territorial treasurer is hereby authorized and directed to pay said warrants out of any moneys in the university fund.

SEC. 3655. For the purpose of carrying out the provisions of this act a loan of \$25,000 is hereby authorized to be negotiated and made on the faith and credit of the Territory of Arizona and to bear interest at the rate of 5 per cent per annum.

SEC. 3656. The treasurer of the Territory of Arizona is hereby authorized and directed to issue and deliver to said "board of regents of the University of Arizona," and said board of regents are hereby authorized to sell not exceeding \$25,000 of the bonds of this Territory, bearing interest at 5 per cent per annum, which interest shall be payable annually in gold coin of the United States on the first Monday in January in each year at the office of the Territorial treasurer. The principal of said bonds shall be, and is, expressly made payable in gold coin of the United States, within twenty years after the date of their issue, and shall be of such denomination as the said board of regents shall direct, and shall bear the date of their issue and shall be signed by said treasurer of the Territory of Arizona and countersigned by the president of said board of regents in his official capacity, and shall have the seal of the said board of regents affixed thereto, and the faith of the Territory of Arizona is hereby pledged for the payment of said bonds and the interest accruing thereon, as herein provided.

SEC. 3657. Coupons for the interest accruing on said bonds shall be attached thereto severally, so that they may be removed without injury or mutilation to the bond. Said coupons shall be consecutively numbered, and shall bear the number of the bond to which they are attached, and shall be signed by the Territorial treasurer.

SEC. 3658. Said bonds shall be prepared and signed by the treasurer of the Territory of Arizona, with said coupons attached thereto, and delivered to said board of regents of the University of Arizona at any time hereafter and as soon as practicable after said treasurer shall have been requested by said board of regents so to do, taking receipt of said board therefor.

SEC. 3659. The expense incurred by the Territorial treasurer in having said bonds prepared shall be paid out of the general fund of the Territory, from any money therein not otherwise appropriated, to be expended only upon warrants drawn by the Territorial auditor upon the certificate of the Territorial treasurer that the expense has been incurred and that the claim is just.

SEC. 3660. It shall be the duty of the Territorial treasurer to keep and transmit to his successor a permanent record of all bonds issued under the provisions of this act, and it shall be the duty of said board of regents of the University of Arizona also to keep a permanent record in the office of said board and of all bonds sold, the name of the purchaser, and price received by said board under the provisions of this act, and transmit to the governor a certified copy of said record as soon as said bonds shall have been sold.

SEC. 3661. The board of regents of the University of Arizona is hereby authorized to demand of and receive from the treasurer the bonds authorized by this act to be issued and sold, or such part of the same as in the judgment of this board shall be necessary to carry out the purposes of this act, and after the same shall have been countersigned by the chancellor of the University of Arizona the said board of regents is hereby authorized to sell said bonds for the purpose of constructing and furnishing upon the grounds of the university the necessary buildings to provide proper accommodations for a museum, a library, and administrative offices of the university. Any moneys received by said board from the sale of bonds and not expended under the provisions of this act for constructing and furnishing said buildings as herein required shall be paid into the Territorial treasury, and by the treasurer placed in the university funds by this act created.

SEC. 3662. Before the sale of any of said bonds the said board of regents shall cause notice of such sale to be published in four daily newspapers published in English; one at the city of New York, State of New York; one at the city of San Francisco, State of California; one at the Territorial capital, and one at the city of Tucson, in said Territory. Such notice shall specify the amount of bonds to be sold, the rate of interest they shall bear, the place, day, and hour of sale, and that sealed proposals will be received by said board of regents within one month from the expiration of such publication, and that none of said bonds will be sold for less sum than their par value: and at the place, on the day and hour named in said notice, the board of regents shall open all sealed proposals received by it, and shall award the purchase of said bonds to the highest bidder or bidders therefor: *Provided*, That such bid shall not be for a less sum than the par value of said bonds: *And provided further*, That said board of regents may reject any and all bids if they deem it to the advantage of the Territory: *And provided further*, That if none of said bids are accepted said board of regents shall again advertise said bonds for sale and proceed as hereinbefore provided under fresh notice of sale.

SEC. 3663. For the payment of the interest on the bonds issued under this act, after such bonds shall have been issued, there is hereby levied annually, in addition to all taxes otherwise directed to be levied and collected, a tax of one-half cent on each \$100 of the assessed value of all real and personal property in the Territory of Arizona, to be placed by the Territorial treasurer in a fund to be known as the "University interest fund;" and commencing ten years thereafter there shall be in like manner annually levied and collected such an additional amount as shall pay \$2,500 of the principal of said bonds and any amount of interest accrued thereon and remaining unpaid by said interest fund, to the end, intent, and purpose that all of the principal and interest of said bonds shall be fully paid during the period of twenty years from the date of their issuance. The Territorial auditor shall certify the rate of tax computed by him to the several boards of supervisors throughout the Territory necessary to raise the required amount for the redemption of the bonds as above stated, and the said boards of supervisors are hereby directed and required to enter such rate on the assessment rolls of their respective counties, in the same manner and with the same effect as is provided by law in relation to other Territorial and county taxes. Every tax levied under the provisions or authority of this act is hereby made a lien against the property assessed, which lien shall attach on the first Monday in February in each year, and shall not be satisfied or removed until such tax has been paid. All moneys derived from taxes authorized by this section shall be paid into the Territorial treasury and shall be applied:

1. To the payment of interest on the bonds issued by the provisions of this act.
2. To the payment of the principal of such bonds: *Provided*, That all moneys remaining in the Territorial treasury, after the payment of the interest and principal in each year thereafter, as herein provided, after the issuance of any bonds under this act, shall be transferred by the Territorial treasurer to a fund which shall be known as the "University fund," and the Territorial treasurer is hereby authorized and directed to open a separate account with, and keep said moneys so transferred to said fund, and all other moneys which are paid into said fund, separate, and apply the same only in payments of the expenses of the maintenance of said university.

SEC. 3664. Whenever, after the expiration of ten years from the issuance of any bonds under this act, there remains after the payment of the interest, as provided in this section, a surplus of \$2,500 or more, it shall be the duty of the Territorial treasurer to advertise for the space of one month in like manner as said board of regents of university advertise for bids, as set forth in section 3662 herein, which advertisement shall state the amount in the sinking fund and the number of bonds, numbering them in order of their issuance, commencing at the lowest

number then outstanding, which such fund is set apart to pay and discharge, and if such bonds so numbered in such advertisements shall not be presented for payment and cancellation at the expiration of such publications, then such fund shall remain in the treasury to discharge such bonds whenever presented, but they shall draw no interest after the expiration of such publication. Before any such bonds shall be paid they shall be presented to the Territorial auditor, who shall indorse on each bond the amount due thereon, and shall write across the face of each bond the date of its surrender and the name of the person surrendering the same.

SEC. 3665. The Territorial treasurer shall keep a full and particular account and record of all his proceedings under this act, and of the bonds redeemed and surrendered, and he shall submit to the governor an abstract of all his proceedings under this act with his annual report, to be by the governor laid before the legislature biennially, and all books and papers pertaining to the matter provided in this act shall at all times be open to the inspection of any party interested, or the governor, or a committee of either branch of the legislature, or a joint committee of both.

SEC. 3666. It shall be the duty of the Territorial treasurer to pay the interest on said bonds when the same falls due, out of the interest fund, if sufficient, and if said fund be not sufficient, then to pay the deficiency out of the general fund: *Provided*, That the Territorial auditor shall first draw his warrant on the Territorial treasurer, payable to the order of said treasurer, for the amount of interest money about to become due and payable out of the general fund, which said interest warrant shall be drawn at least one month previous to the maturing of the interest.

SEC. 3667. This act shall take effect immediately, subject, however, to its approval and ratification by the Congress of the United States.

#### ARKANSAS.

Constitution (1874). Article XIV: SEC. 2. No money or property belonging to the public-school fund, or to this State for the benefit of schools or universities, shall ever be used for any other than the respective purposes to which it belongs.

[The following matter is taken from A Digest of the Statutes of Arkansas, Embracing all Laws of a General Nature in force at the Close of the Session of the General Assembly of 1893, by Sanders and Hill. Columbia, Mo., 1894.]

SEC. 4054. By an act of the general assembly of January 31, 1867, the State of Arkansas signified and declared her assent to the grant of land and land scrip authorized and contained in the acts of Congress approved July 2, 1862, and July 23, 1866, which terms and conditions were as follows:

First. The State of Arkansas will replace any portion of the fund provided by section 4 of said act, or any portion of the interest thereon, which shall by any action or contingency be diminished or lost, so that the capital fund shall remain forever undiminished, and will apply the annual interest thereon regularly, without diminution, to the purposes mentioned in the fourth section of the said act of Congress, subject only to the exception contained in section 5 of the act last referred to.

Second. The State of Arkansas, further assenting, agrees that no portion of said fund, nor the interest thereon, shall be applied, directly or indirectly, under any pretense whatever, to the purchase, erection, preservation, or repair of any building or buildings.

Third. The State of Arkansas further agrees to provide at least not less than one college, as prescribed in the fourth section of said act of Congress, and in accordance with the act amendatory of said act, and also to pay the United States the amount received of any lands previously sold to which the title of purchasers was valid.

Fourth. The State of Arkansas further agrees that an annual report shall be made regarding the progress of each college, in accordance with paragraph 4 of section 5 of said act of Congress of July 2, 1862.

SEC. 4055. By an act of the general assembly of March 7, 1889, the State of Arkansas accepted the appropriation and assented to the terms contained in an act of Congress approved March 2, 1887, entitled "An act to establish agricultural experiment stations in connection with the colleges established in the several States under the provisions of an act approved July 2, 1862, and of the acts supplementary thereto." The sum of \$15,000 per annum was appropriated by said act of Congress for the maintenance and necessary expenses of such agricultural experiment stations, and the said sum was appropriated by the aforesaid act of the general assembly to the Industrial University. By the aforesaid act of the general assembly the

said appropriation was accepted and assented to in trust for the uses and purposes expressed in the aforesaid act of Congress set forth in the succeeding section.

SEC. 4056. It shall be the object and duty of said experiment stations to conduct original researches or verify experiments on the physiology of plants and animals, the diseases to which they are severally subject, with the remedies for the same; the chemical composition of useful plants at their different stages of growth; the comparative advantages of rotative cropping as pursued under a varying series of crops; the capacity of new plants or trees for acclimation; the analyses of soils and waters; the chemical composition of manures, natural or artificial, with experiments designed to test their comparative effects on crops of different kinds; the adaptation and value of grasses and forage plants; the composition and digestibility of the different kinds of food for domestic animals; the scientific and economic questions involved in the production of butter and cheese, and such other researches or experiments bearing directly on the agricultural industry of the United States as may in each case be deemed advisable, having due regard to the varying conditions and needs of the respective States or Territories.

SEC. 4057. By an act of the general assembly of April 9, 1891, the State of Arkansas accepted the grant and assented to the provisions of an act of Congress of August 30, 1890, for the more complete endowment and support of the colleges for the benefit of agriculture and mechanic arts, established under the act of Congress of July 2, 1862. One of the conditions of said grant was that in States where the white and negro races were separately educated and there was a college for the education of the negro race, that the State should equitably divide said appropriation. Pursuant thereto the State of Arkansas divided the same as follows: Eight-elevenths for the Industrial University, at Fayetteville, and three-elevenths for the Branch Normal College thereof, at Pine Bluff.

SEC. 4058. By the act of Congress mentioned in the preceding section there was provided an appropriation of \$15,000 for each State accepting the same for the year 1890, and the same sum and an annual increase thereof of \$1,000 additional to the preceding year for ten years, and the annual amount thereafter to be \$25,000, said sum to be applied only to instruction in agriculture, the mechanic arts, the English language, and the various branches of mathematical, physical, natural, and economic science, with special reference to their applications in the industries of life and to the facilities for such instruction.

SEC. 4059. The State treasurer shall receive, under his official responsibility, all sums due and to become due from the United States from the appropriation mentioned in the preceding section and pay the same to the trustees of the aforesaid university and branch thereof in the proportion aforesaid. (Act April 9, 1891, sec. 9.)

SEC. 4060. The State treasurer shall be the financial agent and trustee of the State, to apply for and receive of the United States all the land scrip to which the State may be entitled by reason of the acceptance of the terms of the act of Congress of July 2, 1862, and acts amendatory thereof. (Act March 27, 1871, sec. 1.)

SEC. 4061. All property or bonds donated or bid for the location of said university, and accepted by said board of trustees, shall constitute a part of the funds of said university.

SEC. 4062. It is hereby made the absolute duty of the county court of the county or corporation council issuing such bonds to annually levy a tax and collect in currency or overdue coupons of such bonds a sum fully sufficient to pay all accruing interest on such bonds and incidental expenses connected therewith; and upon failure to do so, it shall be the duty of any court of competent jurisdiction, upon the application of any one or more holders of such bonds, to compel such county court or council forthwith to levy and collect such sums as will fully pay all such interest as herein provided for. (Act March 27, 1871, secs. 9 and 10.)

SEC. 4063. It shall be the duty of the county court of the county of Washington, at each annual meeting held for the purpose of levying taxes, to provide for the levy of a tax of 1 mill on each one dollar's worth of taxable property, to be paid into the county treasury as a sinking fund to be set apart and kept for the sole purpose of liquidating the thirty-year 8 per cent bonds, known as "college bonds," held in trust by the State of Arkansas for the benefit of the Arkansas Industrial University.

SEC. 4064. It shall be the duty of the treasurer of said county, when the said taxes, as provided in section 4063, shall have been collected and paid to him annually under the direction of the county court of said county, to invest the same to the best possible advantage in interest-bearing bonds or securities of the State of Arkansas or of any other State bearing the highest rate of interest and deemed good and safe. And the said county treasurer shall also, in like manner, as the

interest shall accrue and be collected on the investments aforesaid, from time to time invest said interest in interest-bearing bonds or good securities.

SEC. 4065. It shall be the duty of the city council of the city of Fayetteville, in said county of Washington, at each annual meeting held for the purpose of levying taxes, to provide for the levy of a tax of 1 mill on each one dollar's worth of taxable property, to be paid into the city treasury as a sinking fund, set apart and kept for the sole purpose of liquidating the thirty-year 8 per cent bonds, known as "college bonds," held in trust by the State of Arkansas for the benefit of the Arkansas Industrial University.

SEC. 4066. It shall be the duty of the treasurer of said city, when the said taxes provided for in section 4065 shall have been collected and paid to him annually under the direction of the city council of said city, to invest the same to the best possible advantage in interest-bearing bonds or securities of the State of Arkansas or of any other State bearing the highest rate of interest and deemed good and safe; and the said city treasurer shall also, in like manner, as the interest shall accrue and be collected on the investments aforesaid, invest said interest in interest-bearing bonds or securities as aforesaid. (Act March 28, 1885.)

SEC. 4067. The governor of the State of Arkansas, by and with the consent of the senate, shall appoint, and there is hereby created, a board of six trustees for the Arkansas Industrial University, to be appointed one from each Congressional district, to be composed of representatives of the agricultural, mechanical, and literary pursuits of life as nearly as possible, who shall hold their office for the term of six years from the date of their appointment and until their successors are appointed and qualified: *Provided*, When the first appointment is made under the provisions of this act, two members of said board shall be appointed for the term of two years, two for four years, and two for six years; and every two years thereafter two members of said board shall be appointed for the term of six years. The governor shall be, *ex officio*, president of said board, and in all cases of tie votes shall cast the deciding vote; and in his absence the board shall elect a presiding officer. A less number than a quorum may adjourn from time to time. (Act March 30, 1887, sec. 1, as amended by act March 31, 1891.)

SEC. 4068. Said board is made a body politic and corporate, and shall have all the powers of a corporate body, subject to the constitution and laws of the State of Arkansas, and possess all the powers and authority now possessed by the board of trustees of said university under existing laws, and shall make and subscribe an affidavit before entering upon their respective duties, to faithfully, diligently, and impartially discharge the duties of their office. (Act March 30, 1887, sec. 2.)

SEC. 4069. The board of trustees shall have power to prescribe all rules and regulations for the government and discipline of said university, subject to the provisions of this chapter and such other acts of the general assembly as may hereafter be prescribed. (Ib., sec. 4.)

SEC. 4070. The board of trustees shall cause to be made an annual report of the operations and condition of the agricultural and mechanical departments of said university, which shall include:

First. A statement of the number of acres in cultivation on the college farm, the kind of crops raised, and the number of acres of each kind.

Second. The manner of the preparation of the soil for the various crops, methods of seeding and planting, kind and variety of seeds, manner of cultivating and of harvesting.

Third. The several kinds and descriptions of all implements used in the various stages of the different crops, with reports on their utility and adaptation for the purposes used.

Fourth. The time of preparation of the soil, sowing, planting, cultivating, and harvesting, and a general statement of the weather and its influence upon the several crops.

Fifth. The kinds of fertilizers used and crops to which they were applied, the time and manner of application, and the several results.

Sixth. A detailed and systematic account of the number of days' work, of ten working hours each, of men and teams in the production of each separately treated crop, said statement of labor to be in three divisions: First, up to the time the seed are deposited in the ground; secondly, during cultivation; thirdly, while harvesting and preparing the crop for market.

Seventh. A full and accurate yield per acre, by weight or measure, of all crops raised on the farm, distinguishing between the several kinds of treatment as to fertilizers used, and depth of plowing, difference of cultivation, times of harvesting, kind or variety of seed used.

Eighth. Kind and quantity of machinery and tools used in the mechanical department; the kind and quality of each shop or division of said department, and an approximate cost of production of each article manufactured. (Act March 30, 1887, sec. 10.)

SEC. 4071. The board of trustees shall meet annually, and shall have power to hold adjourned meetings when the business of the university actually requires it, or the president of the board may call a meeting of the board when he is satisfied the interests of the university require it or when five members of the board petition him to do so. (Act May 30, 1874, sec. 4.)

SEC. 4073. The president of the board shall attend the meetings of the board and shall perform all such duties as are herein required or may be directed by said board, without salary or fees or any compensation whatsoever, except such as he now receives for other services for the State; but his own and the trustees' necessary traveling expenses and board bills and other necessary incidental expenses in carrying this chapter into effect shall be paid by the State, upon the official certificate of the person incurring such expense being approved by the president of the board, which shall be a voucher in the office of the auditor of the State. Said trustees shall each receive \$2.50 for each day necessarily consumed on duty as such trustees, payable as above provided for. (Act March 27, 1871, sec. 12, as modified by subsequent legislation.)

SEC. 4074. Said board of trustees shall fix, and from time to time regulate, the fees, allowances, salaries, and wages to be paid architects, inspectors, professors, teachers, agents, committees, servants, or other necessary employees; and they shall observe rigid economy in such expenditures. (Ib., sec. 16; but see 4094 seq.)

SEC. 4075. The board of trustees, for any cause by them deemed sufficient, shall have power, by majority vote taken at any meeting, to remove any member from said board: *Provided*, No member shall be so removed without as many as five of such trustees voting for such removal; and when any member of said board shall be so removed the votes of the trustees shall be recorded, and the president of the board shall make a certificate showing the result of such vote and transmit the same without delay to the governor, who shall at once declare the commission which had been issued to such removed trustee vacated, and appoint and commission some competent man to fill the vacancy so occasioned.

SEC. 4076. The said board of trustees are fully empowered and authorized, either as a board or through any committee they may select or appoint, to inquire into and fully investigate any and all charges that have been or may be preferred against any trustee of said board, or any member of any committee appointed by or under the direction of said board, or any contractor, architect, builder, employee, or agent or other person acting by agreement with or authority of, or under, said board of trustees, or any of the committees of said board, in any capacity whatever; and for the purposes of such investigations or inquiry, said board, or any committee appointed by them, shall hold meetings in the State at such time and place as may be designated by the board, or by the committee so appointed, and the chairman of the executive committee of said board, for the time being, shall have full and ample power to issue all necessary process for summoning and compelling attendance of witnesses before such board or committee, and may impose upon all witnesses who refuse to obey such process, or to testify fully and explicitly before such board or committee in reference to any and all such matters as may be the subject of inquiry, all the pains and penalties that might or could be imposed upon such witness by the circuit court in any case if he were to fail and refuse to appear and testify before the proper circuit court of his county in a cause or matter legally pending therein, after being duly summoned to appear and testify therein, and said process, issued by the chairman of said executive committee, may be directed to any sheriff, coroner, or constable in this State; and if such officer fails, neglects, or refuses to execute such process, he shall be subject to all the forfeitures, pains, and penalties which might or could be imposed upon him for failing, neglecting, or refusing to serve necessary or proper process from a circuit court in his own county, and such fine, imprisonment, and penalties as can be so assessed shall be enforced and carried out upon the order of such chairman of the executive committee, which chairman shall be required to have no commission to so act except as a member of the board, and a certificate of his election or appointment to such place by the board of trustees or the president of such board.

SEC. 4077. The material parts of all examinations and inquiries had by any committee shall be reduced to writing and laid before the board for their action; and process under this act shall run in the name of the State, and officers and witnesses shall execute and obey the same without any advanced fee or compensation, and their accounts or claims for such service or attendance, or other costs

arising in such investigation, shall be presented to said board of trustees, and they shall, through their president, order certificates issued upon their treasurer for reasonable compensation. (Act April 5, 1873.)

SEC. 4078. The board of trustees of the Arkansas Industrial University at the first meeting after April 1, 1893, shall elect a secretary of the board and a treasurer of the university, who shall hold their offices two years, or until their successors are in like manner appointed and qualified.

SEC. 4079. Both of said offices shall not be held by the same person at one time.

SEC. 4080. The said secretary and treasurer shall each execute such bonds and perform such duties as are now required by law, and under such regulations as may be prescribed by the said board of trustees.

SEC. 4081. The compensation allowed the secretary shall be fixed at \$600 per annum and the salary of the treasurer shall be fixed at \$300 per annum, and in no case shall the salary of either officer for any and all services rendered the said board of trustees of the university be increased unless by an act of the general assembly. (Act April 14, 1893.)

SEC. 4082. The said treasurer and secretary shall each execute a bond to the State of Arkansas, for the use of the university, with security approved by the board or the president thereof, in vacation, in such sum as they may require, not less than \$10,000, for the faithful performance of all the duties that may appertain to their respective offices, which bonds shall be filed in the office of the secretary of state. (Act March 6, 1875, sec. 3.)

SEC. 4083. It shall be the duty of said secretary to keep, in a well-bound book to be furnished for that purpose, a true and correct record of the transactions of said board, which shall be open to the inspection of any citizen of this State at all times on demand. He shall also have the custody of all books, papers, documents, and other property which may be deposited in his office by the order of said board, and also the buildings and grounds pertaining to said university, and shall, from time to time, and so often as directed by said board, prepare and transmit to the superintendent of public instruction reports of any of the transactions of said board of trustees as may be ordered. (Act March 30, 1887, sec. 3.)

SEC. 4084. Said treasurer shall at no time draw from the treasurer of the State or have on hand more than \$10,000, and the same shall be paid out as the board shall direct. (Act March 27, 1871.)

SEC. 4085. The board shall have power to remove such officers. (Ib.)

SEC. 4086. The general assembly, in appropriating moneys for the benefit of said university, shall specify the precise amount that it intends to appropriate for each and every purpose, and the trustees of said institution shall apply each sum as thus directed, and in no other way. (Act February 20, 1883.)

SEC. 4087. No appropriation made for any specific purpose shall be used for any other purpose, and the power of contracting debts by the board of trustees in the absence of any appropriation is expressly prohibited. (Act April 4, 1893.)

SEC. 4088. (See act of April 19, 1895, *post*.)

SEC. 4089. Any vacancies in the number of beneficiaries during the terms of the university shall be filled by appointment by the judge of the county court. Any beneficiaries appointed as herein prescribed shall comply with the rules and regulations provided by the board of trustees in reference to such beneficiaries.

SEC. 4090. It shall be the duty of the judge of the county court, immediately upon receiving notification from the board of trustees as above provided, to give notice, in the manner prescribed by law for the publication of legal notices, of the number of beneficiaries allowed to the county, and of the time, manner, and place of making appointments to the same, and no person shall be admitted to the said university as a beneficiary who has not been appointed in accordance with the provisions of this section.

SEC. 4091. By section 11, act March 30, 1887, provision was made for the erection of dormitories for the use of the beneficiaries, and provided that if the beneficiaries were not sufficient in number to fill such dormitories the president may permit other students to occupy the surplus room.

SEC. 4092. Females may be received as beneficiaries. (Act March 18, 1889, amending sec. 5, act March 30, 1887.)

SEC. 4093. The faculty of said university shall consist of a president and such professors as the board of trustees may deem necessary, whose compensation shall be fixed by the board of trustees. One of said professors shall be styled the superintendent of agriculture, whose duty it shall be to supervise the agricultural department, and to perform such other duties as may be necessary in order to impart a theoretical and practical knowledge of the science of agriculture to the students over whom he shall have control. One of said professors shall be styled the superintendent of mechanic arts, whose duty it shall be to supervise the

mechanical department, and to perform such other duties as may be necessary in order to impart to those under his care a theoretical and practical knowledge of the mechanic arts: *Provided*, The board of trustees may employ such assistants as they may deem necessary, whose compensation shall be fixed by said board of trustees: *And provided*, The manner of payment of all salaries shall be regulated by said board. (Act March 31, 1891, amending sec. 8, act March 30, 1887.)

SEC. 4094. The salary of president of the faculty shall be \$2,000 per annum, payable quarterly; that of professors and superintendents, each the sum of \$1,500 per annum, payable quarterly, except the superintendent of agriculture and the superintendent of mechanic arts, which shall be \$1,600 each. (Act March 30, 1887, section 9.)

SEC. 4095. The course of study in said university shall embrace agricultural chemistry, animal and vegetable anatomy, and physiology, the application of science and the mechanic arts to practical agriculture in the field, veterinary arts, entomology, rural and household economy and horticulture, practical mechanic arts as taught in the workshops, the English language and literature, mathematics, civil engineering, philosophy, history, and bookkeeping; including military tactics and such other branches of study as the board of trustees may prescribe.

SEC. 4096. Each male student below the sophomore class shall be compelled, as a part of his education, to work at least two hours each school day, either in the field or workshop, under the direction of their respective superintendents; the labor to be paid for at such rate as may be prescribed by the board of trustees, to be applied to the board of such students: *Provided*, Any student may be allowed to do extra work with the consent of the faculty and receive pay for the same. (Act March 31, 1891, amending section 6, act March 30, 1887.)

SEC. 4097. The board of trustees shall direct, order, and restrict all improvements made on the farm, such as repairing and building fences, repairing and building houses, buying stock, utensils, etc., repairing and resetting fruit trees, etc., all of which shall be done in a practical and economical way: *Provided*, As far as practicable all labor to be performed on or about said farm shall be done by the students of the university.

SEC. 4098. The proceeds arising from the sale of the products of the agricultural and mechanical departments shall constitute a fund out of which to pay for the labor performed by the students in said departments.

SEC. 4099. No student shall be allowed more than 10 nor less than 3 cents per hour for his labor.<sup>a</sup>

SEC. 4100. By a special act of date March 30, 1883, and an amendment thereto, April 9, 1891, a prohibition district of 3 miles is established with the university as the center. The selling and giving away of spirituous, vinous, or malt liquors is forbidden unless the same is given by a physician as medicine, and not by him except under the restrictions of the act. Anyone interested in the sales, or suffering the liquors to be sold in a house owned or controlled by them, shall likewise be guilty. Stringent provisions for the prosecution and detection of such sales are provided by the acts aforesaid.

SEC. 3401. It shall be the duty of the superintendent of agriculture [professor of chemistry, act April 9, 1895] at the experimental station of the university [at the State university, ib.] to make or cause to be made a chemical analysis of every sample of commercial fertilizer so furnished him, and he shall issue a certificate to the person or company so furnishing said sample, setting forth that said analysis is a true and complete analysis of the sample furnished him of such brand of fertilizer, giving the per cent of ammonia, potash, and available [soluble, reverted, and insoluble, act April 9, 1895] phosphoric acid of such sample of commercial fertilizer so furnished, and all other available fertilizing ingredients in said sample.

SEC. 3402. Every package of commercial fertilizer offered for sale within the State whose value is more than \$10 per ton must have placed upon or securely attached to each package by the manufacturer a guarantee analysis \* \* \* which shall substantially correspond with the analysis of the sample of same brand so furnished the superintendent of agriculture [professor of chemistry, act April 9, 1895].

SEC. 3404. The superintendent [professor of chemistry, act April 9, 1895] of the State university shall receive for analyzing a fertilizer and affixing his certificate thereto the sum of \$15 for each and every brand of fertilizer analyzed for any

<sup>a</sup> Note by the editors of the digest: "This provision is apparently in conflict with the act of March 31, 1891, section 4096, but as the same provision was in section 6, act of March 30, 1887, of which section 4096 is an amendment, it seems to have been the legislative intent that the two provisions be harmonized, both being in the same act."

manufacturer or vendor; but any agriculturist of the State or purchaser of any commercial fertilizer in this State may take a sample of the same, under the rules and directions of the said superintendent of agriculture [professor of chemistry, act April 9, 1895] at the said experiment station, and forward same to said superintendent of agriculture [professor of chemistry] for analysis, which analysis shall be made free of charge. (Act March 8, 1889.)

Act approved April 19, 1895, section 4088 *supra*, was amended to read thus:

SEC. 4088. It shall be the duty of the board of trustees to apportion the number of beneficiaries who shall be admitted as students in the university without tuition among the several counties of the State according to population and to notify the county judge of each county of the number apportioned to the county at least two months prior to the beginning of each regular annual session of the school; and it shall be the duty of the county judge to appoint from the actual residents of the county the number of beneficiaries to which it may be entitled, a preference being given to those noted for diligence and proficiency in study, and the appointments so made shall be entered of record. If the judge of any county shall fail to appoint its quota of beneficiaries, or if those appointed shall fail to attend, the president of the university shall appoint such beneficiaries to the full number authorized by law from other counties having their full quota: *Provided*, Such appointments shall be vacated on application of the county judge of a county so failing to fill its quota.

Act approved May 23, 1901: SECTION 1. Whereas the State of Arkansas now holds \$30,000 of bonds issued by the city of Fayetteville, in trust as a permanent endowment fund for the University of Arkansas, and whereas said bonds mature on the 1st day of January, 1903, and whereas the city of Fayetteville will be enabled to meet the entire obligation, now therefore the State treasurer is hereby authorized to surrender such number of said bonds to the city of Fayetteville as it may be able to pay and does pay when such bonds mature.

SEC. 2. The city of Fayetteville is authorized and empowered to issue new 5 per cent bonds, payable in twenty years, or at the option of said city in five years, in lieu of the bonds said city is unable to pay, and the State treasurer shall surrender the old bonds at maturity and accept the new bonds in exchange therefor.

SEC. 3. Whereas the act of 1871, locating the University of Arkansas, provided that the county or corporation securing the location should not be required to pay more than one year's interest on its bonds before the completion of the buildings, and in case more than one year's interest was collected by the State that the State would refund said interest; and whereas by act of 1875 the legislature refunded to Washington County \$16,000 in 6 per cent bonds for the interest erroneously collected from said county on its university bonds for the years 1873 and 1874, and whereas the State erroneously collected \$4,800 and has never refunded said amount to said city, therefore the State treasurer at the time of settlement shall surrender to said city such numbers of the old university bonds as shall amount to said tax so erroneously collected.

SEC. 4. All money paid by the city of Fayetteville for said bonds shall be invested by the State debt board as a permanent endowment fund for said university in safe securities, and such securities, together with the new 5 per cent bonds issued by said city, shall be held by the State treasurer in trust for said university, and the interest annually collected thereon shall be turned over to the treasurer of said university.

SEC. 4. That the city council of the city of Fayetteville shall destroy and burn the old bonds turned over to said city at the time of settlement by the State treasurer at their first regular meeting after settlement.

## CALIFORNIA.

Constitution (1879), Article IX: SECTION 1. A general diffusion of knowledge and intelligence being essential to the preservation of the rights and liberties of the people, the legislature shall encourage by all suitable means the promotion of intellectual, scientific, moral, and agricultural improvement.

SEC. 2. The public school system shall include primary and grammar schools, and such high schools, evening schools, normal schools, and technical schools as may be established by the legislature, or by municipal or district authority, but the entire revenue derived from the State school fund, and the State school tax, shall be applied exclusively to the support of primary and grammar schools.

SEC. 8. No public money shall ever be appropriated for the support of any sectarian or denominational school, or any school not under the exclusive control of the officers of the public schools, nor shall any sectarian or denominational doc-

trine be taught, or instruction therein be permitted, directly or indirectly, in any of the common schools of the State.

SEC. 9. The University of California shall constitute a public trust, and its organization and government shall be perpetually continued in the form and character prescribed by the organic act creating the same, passed March 23, 1868, and the several acts amendatory thereof, subject only to such legislative control as may be necessary to insure compliance with the terms of its endowments, and the proper investment and security of its funds. It shall be entirely independent of all political and sectarian influence, and kept free therefrom in the appointment of its regents and in the administration of its affairs: *Provided*, That all the moneys derived from the sale of the public lands donated to this State by act of Congress, approved July 2, 1862, and the several acts amendatory thereof, shall be invested as provided by said acts of Congress, and the interest of said moneys shall be inviolably appropriated to the endowment, support, and maintenance of at least one college of agriculture, where the leading object shall be, without excluding other scientific and classical studies, and including military tactics, to teach such branches of learning as are related to scientific and practical agriculture and the mechanic arts, in accordance with the requirements and conditions of said acts of Congress; and the legislature shall provide that if, through neglect, misappropriation, or any other contingency, any portion of the funds so set apart shall be diminished or lost, the State shall replace such portion so lost or misappropriated, so that the principal thereof shall remain forever undiminished. No person shall be debarred admission to any of the collegiate departments of the university on account of sex.

Statutes of California, act March 23, 1868: SECTION 1. A State university is hereby created pursuant to the requirements of section 4, article 9, of the constitution of the State of California.<sup>a</sup>

[The following matter is taken from the Political Code of the State of California, compiled by James H. Deering, San Francisco, 1893.]

SEC. 1385. The University of California, located in Alameda County, has for its object general instruction and education in all the departments of science, literature, art, industrial and professional pursuits, and special instruction for the professions of agriculture, the mechanic arts, mining, military science, civil engineering, law, medicine, and commerce.

SEC. 1386. There must be maintained in the university—

1. A college of letters.
2. A college or colleges of science, including agriculture, mechanics, mining, engineering, chemistry, and such other specialties as the board of regents may determine.
3. Colleges of medicine and law.
4. Such other colleges as the board of regents may establish.

SEC. 1387. The college of letters must embrace a liberal course of instruction in language, literature, and philosophy.

SEC. 1388. Each full course of instruction consists of its appropriate studies and courses, to be determined by the board of regents.

SEC. 1389. The president of the university is the executive head of the institution in all its departments, except as herein otherwise provided.

SEC. 1390. He must, subject to the board of regents, give general direction to the practical affairs of the several colleges, and, in the recess of the board of regents, may remove any employee or subordinate officer not a member of any faculty and supply for the time being any vacancies thus created; and until the regents otherwise direct he is charged with the duties of one of the professorships.

SEC. 1391. The immediate government of the several colleges is intrusted to their respective faculties, each of which must have its own organization, regulate its own affairs, and may recommend the course of study and the text-books to be used.

SEC. 1392. Any resident of California of the age of 14 years or upward, of approved moral character, may enter himself in the university as a student at large and receive tuition in any branches of instruction at the time when the same

<sup>a</sup>Constitution of 1849: The legislature shall take measures for the protection, improvement, or other disposition of such lands as have been or may hereafter be reserved or granted by the United States or any person or persons to the State for the use of the university; and the funds accruing from the rents or sale of such lands, or from any other source for the purpose aforesaid, shall be and remain a permanent fund, the interest of which shall be applied to the support of said university, with such branches as the public convenience may deem for the promotion of literature, the arts, and sciences as may be authorized by the terms of such grant. And it shall be the duty of the legislature, as soon as may be, to provide effectual means for the improvement and permanent security of the funds of said university.

are given in their regular course on such terms as the board of regents may prescribe.

SEC. 1393. An admission fee and rate of tuition fixed by the board of regents must be required of each pupil, except as herein otherwise provided.

SEC. 1394. As soon as the income of the university shall permit, admission and tuition must be free to all residents of the State; and the regents must so apportion the representation of students, according to population, that all portions of the State may enjoy equal privileges therein.

SEC. 1395. If approved by the board of regents, scholarships may be established in the university by any persons for the purpose of private benefaction or of affording tuition in any course of the university free from the ordinary charges to any scholar in the public schools of the State who may distinguish himself in study, according to the recommendation of his teachers, and who passes the examination required for the grade at which he wishes to enter the university.

SEC. 1396. The board of regents may affiliate with the university any incorporated college of medicine, law, or other special course of instruction upon such terms as may be deemed expedient; and such college may retain the control of its own property, have its own board of trustees, faculties, and presidents, respectively, and the students of such colleges, recommended by the respective faculties thereof, may receive from the university the degrees of those colleges.

SEC. 1397. The examination for degrees must be annual. Students who have passed not less than a year as residents in any college, academy, or school in this State, and who, after examination by the faculty thereof, are recommended by them as proficient candidates for any degree in any regular course of the university, must be examined therefor at the annual examination, and on passing such examination may receive the degree and diploma for that course and rank as graduates.

SEC. 1398. All students of the university who have been residents thereof for not less than one year, and all graduates thereof, may present themselves for examination in any course at the annual examinations, and, on passing such examination, may receive the degree and diploma of that course.

SEC. 1399. Upon such examinations each professor and instructor of that course may cast one vote, by ballot, upon each application for recommendation to the board of regents for a degree.

SEC. 1400. Graduates of the College of California and of any incorporated college affiliated with the university may receive the degrees from and rank as graduates of the university.

SEC. 1401. The board of regents may also confer certificates of proficiency in any branch of study upon such students of the university as upon examination are found entitled to the same.

SEC. 1402. The proper degree of each college must be conferred at the end of the course upon such students as, having completed the same, are found proficient therein.

SEC. 1403. The degree of bachelor of arts, and afterwards the degree of master of arts, in usual course must be conferred upon the graduates of the college of letters.

SEC. 1404. A system of moderate manual labor must be established in connection with the agricultural college, upon its agricultural and ornamental grounds, for practical education in agricultural and landscape gardening.

SEC. 1405. No sectarian, political, or partisan test must ever be allowed or exercised in the appointment of regents, or in the election of professors, teachers, or other officers of the university, or in the admission of students thereto, or for any purpose whatsoever; nor must the majority of the board of regents be of any one religious sect or of no religious belief.

SEC. 1415. The endowment of the university is—

1. The proceeds of the sale of the 72 sections of land granted to the State for a seminary of learning.

2. The proceeds of the 10 sections of land granted to the State for public buildings.

3. The income derived from the investments of the proceeds of the sale of the lands or of the scrip therefor, or of any part thereof, granted to this State for the endowment, support, and maintenance of at least one college where the leading object shall be—without excluding other scientific and classical studies and including military tactics—to teach such branches of learning as are related to agriculture and the mechanic arts.

4. The income of the fund set apart by "An act for the endowment of the 'University of California,'" approved April 2, 1870, which is continued in force.

[An act for the endowment of the University of California. Chapter CCCCLX: The treasurer of the State shall place to the credit of the university fund so much of any moneys that may be

received by him from the net proceeds of sale of any salt marsh and tide lands lying in and around the Bay of San Francisco belonging to the State of California as, being invested in the bonds of said State or of the United States, shall yield an annual income of \$50,000. Said moneys shall be a fund the capital of which shall remain undiminished and the interest of which shall be inviolably applied to the support of the University of California.]

6. The State of California, in its corporate capacity, may take, by grant, gift, devise, or bequest, any property for the use of the university, and hold the same, and apply the funds arising therefrom, through the regents of the university, to the support of the university as provided in Article IX, section 4, of the constitution [1849, see footnote, p. 22].

7. The regents of the university, in their corporate capacity, may take, by grant, gift, devise, or bequest, any property for the use of the university, or of any college thereof, or of any professorship, chair, or scholarship therein, or for the library, an observatory, workshops, gardens, greenhouses, apparatus, a students' loan fund, or any other purpose appropriate to the university; and such property shall be taken, received, held, managed, and invested, and the proceeds thereof used, bestowed, and applied by the said regents for the purposes, provisions, and conditions prescribed by the respective grant, gift, devise, or bequest.

8. The regents of the university may invest any of the permanent funds of the university which are now or hereafter may be in their custody in productive, unincumbered real estate in this State, subject to the power of the legislature to control or change such investments, excepting such as, by the terms of their acquisition, must be otherwise invested.

9. If by the terms of any grant, etc., such as are described in the preceding sixth and seventh subdivisions, conditions are imposed which are impracticable under the provisions of the civil code, such gift, etc., shall not thereby fail, but such conditions shall be rejected, and the intent of the donor carried out as near as may be.

SEC. 1425. The university is under the control of a board of regents consisting of 22 members, but the president of the university for the time being shall be a member of the board of regents by virtue of his office.

SEC. 1426. Sixteen members of the board are appointed by the governor, with the advice and consent of the senate. Their term of office is sixteen years.

SEC. 1427. Six members of the board hold by virtue of their office. [SEC. 353: The governor, lieutenant-governor, speaker of the assembly, superintendent of public instruction, president of the State board of agriculture, and president of the Mechanics' Institute of San Francisco are ex officio regents of the University of California.]

SEC. 1428. Whenever a vacancy occurs in the board the governor must appoint some person to fill it, and the person so appointed holds for the remainder of the term.

SEC. 1429. The governor is president of the board.

SEC. 1430. Seven members constitute a quorum of the board.

SEC. 1431. The members receive no compensation.

SEC. 1432. The powers and duties of the board of regents are as follows:

1. To meet at such times and places as their rules may prescribe or at the call of the president of the board.

2. To control and manage the university and its property.

3. To prescribe rules for their own government and the government of the university.

4. To adopt and prescribe rules for the government and discipline of the cadets.

5. To receive in the name of the State or of the board of regents, as the case may be, all property donated to the university.

6. To choose the president of the university, the professors, and other officers and employees of the university, prescribe their duties, fix and provide for the payment of their salaries.

7. To fix the qualifications for admission to the benefits of the university.

8. To fix the admission fee and rates of tuition.

9. To appoint a secretary and treasurer, prescribe their duties, and fix and provide for the payment of their compensation.

10. To remove at pleasure any officer, professor, or employee of the university.

11. To supervise the general courses of instruction and, on the recommendation of the several faculties, prescribe the authorities and text-books to be used in the several colleges.

12. To confer such degrees and grant such diplomas as are usual in universities or as they may deem appropriate.

13. To establish and maintain a museum.

14. To establish and maintain a library.

15. To take immediate measures for the permanent improvement and planting of the university grounds.

16. To keep a record of all their proceedings.

17. Through the president of the university, to report to the governor the progress, condition, and wants of each of the colleges embraced in the university, the course of study in each, the number of professors and students, the amount of receipts and disbursements, together with the nature, cost, and results of all important investigations and experiments, and such other information as they may deem important.

SEC. 1433. The entire income arising from the endowment is subject to the trusts at the disposition of the board of regents for the support of the university.

SEC. 1434. For the current expenditures of the university specific sums of money must be set aside, out of the funds at their disposal, by the board of regents, which are subject to the warrants of the president of the board, drawn upon the treasurer of the university in pursuance of the orders of the board of regents.

SEC. 1435. All moneys which may at any time be in the State treasury, subject to the use of the board of regents, may be drawn therefrom by the president of the board, upon the order of the board, in favor of the treasurer of the university.

SEC. 1436. The regents must cause to be constructed such buildings as are needed for the use of the university.

SEC. 1437. The plan adopted in the construction of buildings must provide separate buildings for separate uses, and so group all such buildings that a central building may bring the whole in harmony as part of one design.

SEC. 1438. The construction and furnishing of the buildings must be let out to the lowest responsible bidder, after advertisement for not less than ten days in at least two daily newspapers published in the city of San Francisco; but the regents may reject any bid and advertise anew.

SEC. 1439. Until the university buildings are ready for use the regents may make temporary arrangements for buildings at Oakland.

SEC. 1449. A practical agriculturist, competent to superintend the working of the agricultural farm, and to discharge the duties of secretary of the board of regents, must be chosen by the board as their secretary.

SEC. 1450. The Secretary must—

1. Reside and keep his office at the seat of the university.
2. Keep a record of the transactions of the board of regents, which must be open at all times to the inspection of any citizens of this State.
3. Have the custody of all books, papers, documents, and other property which may be deposited in his office.
4. Keep and file all reports and communications which may be made to the university appertaining to education, science, art, husbandry, mechanics, or mining.
5. Address circulars to societies and others soliciting information upon the latest and best modes of culture of the products adapted to the soil and climate of the State, and on all subjects connected with field culture, horticulture, stock raising, and the dairy.
6. Correspond with established schools of mining and metallurgy in Europe, and obtain information respecting the improvements of mining machinery adapted to California.
7. Correspond with the Patent Office at Washington and with the representatives of the Government of the United States abroad, to procure contributions from these sources; receive and distribute seeds, plants, shrubbery, and trees adapted to our climate and soils, for the purposes of experiment.
8. Obtain contributions to the museums and the library of the university.
9. Keep a correct account of all the executive acts of the president of the university.
10. Keep an accurate account of all moneys received into the treasury or paid therefrom.

11. Distribute the seeds, plants, trees, and shrubbery received by him, and not needed by the university, equally throughout the State, to farmers and others who will agree to cultivate them properly and return to the secretary's office a reasonable proportion of the products thereof, with a statement of the mode of cultivation, and such other information as may be necessary to ascertain their value for cultivation in the State.

12. Publish from time to time in the newspapers of the State, free of charge, information relating to agriculture, the mechanic arts, mining and metallurgy.

SEC. 1451. The secretary holds office at the pleasure of and receives the compensation fixed by the board.

SEC. 1461. The academic senate is composed of the faculties and instructors of the university.

SEC. 1462. The senate must conduct the general administration of the university, regulate the general and special courses of instruction, receive and determine all appeals from acts of discipline enforced by the faculty of any college, and exercise such other powers as the board of regents may confer upon it.

SEC. 1463. Its proceedings must be conducted according to rules of order adopted by it, and every person engaged in instruction in the university may participate in its discussions; but the right of voting is confined to the president and the professors.

SEC. 1473. The students of the university must be organized into a body known as the "university cadets."

SEC. 1474. The officers of cadets, between and including the ranks of second lieutenant and colonel, must be selected by the chief military instructor, with the assent of the president of the university, and must be commissioned by the governor.

SEC. 1475. The adjutant-general of the State must issue such arms, munitions, accouterments, and equipments to the university cadets as the board of regents may require and the governor approve.

SEC. 1476. Upon graduating or retiring from the university, such officers may resign their commissions or hold the same as retired officers of the university cadets, liable to be called into service by the governor in case of war, invasion, insurrection, or rebellion.

SEC. 1477. The military instructor must make quarterly reports to the adjutant-general of the State, showing the number, discipline, and equipments of the cadets.

SEC. 3533. The regents of the university may order the selection of the 150,000 acres of land granted to the State for the use of an agricultural college, and dispose of the same at the price and in the manner fixed by them.

SEC. 3534. The land agent of the university, as the agent of the State, must select the lands according to the instructions of the board, and issue certificates of purchase and patents to purchasers who comply with the conditions fixed by the board; and the regents must invest all moneys accruing from the sale of lands as they may deem best, subject to the conditions of the act of Congress granting such lands.

SEC. 3535. All moneys, securities, or other properties arising from the sale of the 72 sections granted to the State for a seminary of learning, and from the sale of the 10 sections granted to the State for the erection of public buildings, must be paid out of the State treasury on the order of the regents of the university.

SEC. 3536. All persons who have purchased any portion of either of the grants mentioned in the preceding section, and who have not paid in full therefor must be included in the delinquent list, and the district attorney must proceed against such delinquents as provided in sections 3547 and 3548, and the provisions of sections 3548 to 3556 inclusive, are made applicable to such proceedings. If such lands revert to the State, they pass under the control of and may be sold by the board of regents of the university.

SEC. 332. All officers, boards of officers, commissioners, trustees, regents, and directors required by law to make reports to the governor or legislature, except the controller of State, must send the original draft of such reports to the governor before the 15th day of September in the year 1892, and in every second year thereafter.

SEC. 334. The superintendent of State printing must print such reports or such part or parts of said reports as may be ordered by the State board of examiners, in a manner to be designated by said board, before the first Monday in December next after receipt thereof, except the report of the State comptroller, etc.

SEC. 336. All reports must be printed in the English language.

SEC. 350. The geological and other specimens collected by the State geological survey must, excepting such as may be required by the State geologist to aid in the preparation of his report, be delivered over to the agents of the State University, to be by them deposited in the cabinet of the same as the property of the university.

Statutes, 1889, Chapter XVII: Whereas, by section 9 of an act to establish agricultural experiment stations in connection with the colleges established in the several States, it is provided that the grants of moneys authorized by this act are made subject to the legislative assent of the several States and Territories to the purposes of said grants; therefore be it resolved, that the State of California does hereby assent to the grants named in said act, approved March 2, 1887, and to the conditions thereof, for and on behalf of the State of California and the board of regents of the University of the State of California. And be it further resolved that the State of California does hereby specifically designate "The board of

regents of the University of California," a corporation organized and existing under the laws of California, and controlling the University of California, the only institution in this State established in accordance with the provisions of an act approved July 2, 1862, as the institution to which this grant is by law assigned for the benefit of agricultural experiment stations connected with the said university. Be it further resolved, that his excellency the governor of California be requested to transmit to the Secretary of the Treasury of the United States a copy of these resolutions, duly certified by the secretary of state.

Statutes, 1869-70. Act to amend the act of March 28, 1868, providing for the management and sale of the lands belonging to the State, approved April 4, 1870:

SEC. 60. The board of directors of the Agricultural, Mining, and Mechanical Arts College, or such corporations as may be appointed by law to succeed them, shall have power to order the selection of the grant of 150,000 acres of land granted to the State for the use of an agricultural college, and dispose of the same at such price and in such manner as they shall deem best for the interests of the college, and it shall be the duty of the land agent of the university, as the agent of the State, to select the lands in the United States land offices, according to the instructions of said board or corporation; and it shall be the duty of the said land agent to issue certificates of purchase and patent to purchasers who comply with the conditions ordained by the said board or corporation, in the manner prescribed in sections 4 and 5 of this act; and the said board or corporation shall invest any and all moneys accruing from the sale of said lands as they shall deem best, subject only to the conditions of the act of Congress granting such lands.

In a case (*White v. Douglass*) involving the ownership of lands held by the State as trustee or agent of the grant made for the establishment of an institution or institutions for the benefit of agriculture and mechanic arts, July 2, 1862, the supreme court decided that under the Congressional grant to the State of lands for the use of an agricultural college, the State, as owner for the purposes of the grant, had the right to select the lands from surveyed or unsurveyed public lands of the United States, subject to preemption and sale, within the limits of the State, and to prescribe how the selection should be made, and to whom, and in what manner the lands would be sold. (71 Calif., Sept. 27, 1886.)

In a case decided by the supreme court January 16, 1883 (*Hollister v. Sherman*, tax collector), it was decided that all property administered by the regents of the State University is exempt from taxes, and a deed of the tax collector on a sale of property so administered under an assessment against the regents would be void on its face. In *People v. Supervisors* this was reaffirmed. "In our opinion the value of the mortgage to the regents of the university was properly deducted from the full value of the property."

In *Lundy v. Dalmas* (104 Calif., 655): "The regents of the University of California, under the organic act of March 23, 1868, and the subsequent steps taken by them to incorporate, became and are a corporation."

2. The regents of the University of California are not individually liable for the damage done by alleged negligence of a public corporation.

3. Under the provisions of the organic act of March 23, 1868, and of section 9 of Article IX of the constitution, the regents are not public officers. Section 343 of the Political Code, designating them as "civil executive officers," was repealed by said section of the constitution.

The entire income of such funds shall be placed at the disposition of the board of regents for the support of the university. All moneys which may at any time be in the State treasury, and subject to the use of the said board of regents, may be drawn therefrom by the president of the board upon the order of said board in favor of the treasurer of the university.

The constitution having declared (sec. 22) that no money shall be drawn from the treasury but in consequence of appropriations made by law, and upon warrants duly drawn thereon by the controller, a question arose as to the power of the board under this section of this act of March 23, 1868, establishing the university. The supreme court settled the point in the case of *Regents of University of California v. W. A. January*, [State] treasurer, the syllabus of which reads as follows: "All moneys in the State treasury subject to the use of the board of regents of the University of California may be drawn therefrom upon the order of the board indorsed by the governor, and no appropriation or warrant from the controller is necessary for that purpose. (66 Cal., Mar. 16, 1885, p. 507.) In view of these statutory and constitutional provisions, we do not doubt that it was the duty of the respondent [State treasurer] to comply with the resolution of the regents, without requiring in addition thereto a warrant of the controller, or the depositing of an equivalent security, and without regard to the use which the regents proposed to make of the money. With that the respondent had nothing to do. Nor can we pass upon that question in this proceeding. We might give our individual views on it, but we more than doubt the propriety of doing so. The only question which we can decide is whether, upon the face of the facts disclosed by the record, a writ should issue as prayed. The fact of a proper demand having been made on the respondent, and his having refused to perform a duty plainly devolved on him by law, entitles the petitioners to the writ [mandamus]."

## COLORADO.

Constitution (1876), Article VIII, State Institutions: SECTION 1. Charitable institutions established: 1. Educational, reformatory, and penal institutions, and those for the benefit of the insane, blind, deaf, and mute, and such other institutions as the public good may require, shall be established and supported by the State, in such manner as may be prescribed by law.

Article IX: SEC. 7. Aid to sectarian schools, [or] churches forbidden. Neither the general assembly, nor any county, city, town, township, school district, or other public corporation shall ever make any appropriation, or pay from any

public fund or moneys whatever, anything in aid of any church or sectarian society, academy, seminary, college, university, or other literary or scientific institution controlled by any church or sectarian denomination whatsoever; nor shall any grant or donation of land, money, or other personal property ever be made by the State, or any such public corporation, to any church for sectarian purposes.

SEC. 8. Religious test forbidden, etc.—No religious test or qualification shall ever be required of any person as a condition of admission into any public educational institution of the State, either as teacher or student; and no teacher or student of any such institution shall ever be required to attend or participate in any religious service whatever. No sectarian tenets or doctrines shall ever be taught in the public schools, nor shall any distinction or classification of pupils be made on account of race or color.

Article VIII: SEC. 5. Territorial institutions become State institutions.—The following Territorial institutions, to wit, the University at Boulder, the Agricultural College at Fort Collins, the School of Mines at Golden, the Institute for the Education of Mutes at Colorado Springs, shall, upon the adoption of this constitution, become institutions of the State of Colorado, and the management thereof subject to the control of the State, under such laws and regulations as the general assembly shall provide, and the location of said institutions, as well as all gifts, grants, and appropriations of money and property, real and personal, heretofore made to said several institutions, are hereby confirmed to the use and benefit of the same, respectively: *Provided*, This section shall not apply to any institution, the property, real or personal, of which is now vested in the trustees thereof, until such property be transferred by proper conveyance, together with the control thereof, to the officers provided for the management of said institution by this constitution or by law.

[In response to a senate resolution to this effect, to wit: Doubt exists as to the meaning of section 5, Article VIII, of the constitution, the supreme court said: "We call attention to section 2 and section 4 of the article (these fix the seat of government and its capitol building). If the framers of the constitution had not regarded section 5 as permanently locating the institutions named, it is reasonable to suppose that they would have made some explicit provision with regard to their permanent location. \* \* \* The absence of such provisions supports the construction which we have given. It follows that the locations of the institutions named, or of any one of them, can not be changed except by an amendment to the constitution." (December term, 1885, 9 Col., p. 628.)]

[The following matter has been taken from Mills' Annotated Statutes (1891 ed.) and the supplement thereto, "including \* \* \* all laws not in volumes 1 and 2, to January 1, 1897." By J. Warner Mills. Denver, 1897.]

Chapter 2, division 1, Agricultural College: SEC. 36. That to provide a fund for the support and maintenance of the State Agricultural College, located at Fort Collins, there shall be assessed and levied annually upon all taxable property in this State the following tax, to wit: One-fifth of 1 mill on each dollar of the yearly assessed value of such property, which shall be known as the "agricultural college" tax, and shall be levied and collected at the same time and in the same manner provided by law for the assessment and collection of State taxes.

SEC. 37. It shall be the duty of every county treasurer in this State to provide suitable books, in which shall be entered an account of all taxes collected in pursuance of this act. He shall also enter in said book an account of all money transmitted to the State treasurer on account of said fund, as hereinafter provided.

SEC. 38. The fund so created shall be applied exclusively for the support of the Agricultural College of this State, and for the erection of such buildings as by the State board of agriculture shall be deemed advisable.

SEC. 39. It shall be the duty of the county treasurer in the several counties to preserve the agricultural college fund, as provided by this act, as a separate fund, and to transmit the same monthly to the treasurer of the State, who shall keep the same as an agricultural college fund, to be at the disposal of the State board of agriculture, as provided by this act.

SEC. 40. Whenever there shall be any money in the hands of the State treasurer to the credit of the agricultural college fund, deemed sufficient by the State board of agriculture to commence the erection of an agricultural college, the auditor of State is hereby authorized to draw his warrant upon the treasurer of the State in favor of the treasurer of said State board of agriculture, in such sums as said board shall deem necessary to carry on the erection or running expenses of said college: *Provided*, That nothing herein shall be construed as authorizing or empowering said board to create any indebtedness, in any year, beyond the tax so levied in that year for that purpose.

SEC. 41. The auditor of State shall draw his warrant upon the fund herein provided for, upon bills approved by the president of the State board of agriculture,

countersigned by the secretary of said board, to defray the lawful expenses incurred in building and supporting the agricultural college.

[The matter contained in section 36 to section 41, inclusive, was repealed by an act approved March 17, 1891. This act increased the tax to one-sixth of a mill for each of four State educational institutions, of which the Agricultural College was one, but the act was declared unconstitutional by the supreme court of Colorado.]

SEC. 42. This act shall not take effect unless the fee-simple title to the real estate known as the Agricultural College of Colorado shall, within ninety days from the passage of this act, be vested in said State board of agriculture free of any condition whatever. When the said title shall be so vested, it shall be the duty of the attorney-general to certify such fact in writing to the State auditor, and the State auditor shall notify the county clerks of the several counties of this State of the same, in order that the tax herein provided may be properly levied and assessed.

SEC. 43. That for the purpose of further carrying out the provisions of the act of Congress approved July 2, 1862, in relation to agricultural colleges, the military body known as the Agricultural College Cadets, of the Colorado Agricultural College, is hereby organized as an auxiliary branch of the Colorado National Guard, and is placed upon the same footing as regards arms, ammunition, and camp and garrison equipage as the Colorado National Guard.

SEC. 44. That the proper officers of said Colorado National Guard are hereby authorized and directed to honor the requisition of the commanding officer of said Agricultural College Cadets, under such rules and regulations as may hereafter be prescribed by the State military board and the State board of agriculture, when countersigned by the president of said college, for 10 rounds of ammunition per year for each member of said military body, and for such camp and garrison equipage as may be necessary for the proper instruction of said body in all that pertains to the practical duties of soldiers in camp.

SEC. 44a. The cadets of the State Agricultural College shall be attached to the Colorado National Guard, under such rules and regulations as may hereafter be prescribed by the State military board and the State board of agriculture.

SEC. 45. That for the furtherance and promotion of the agricultural interests of the State, an agricultural experimental station shall be established in that section of country commonly known as the "Divide," in the northern part of El Paso County, the precise location to be determined as hereinafter provided.

SEC. 46. The State board of agriculture is authorized to select the necessary lands and secure the same, either by lease or purchase, as they may see fit, and to make all necessary improvements in the way of buildings and fences, and to take such steps as they deem necessary to successfully establish said station.

SEC. 47. The State board of agriculture shall have the control and supervision of said farm. They shall appoint a superintendent and such other officers and employees as may to them appear to be necessary to carry on the said farm successfully. They shall have power to fix salaries and all compensation of employees, and they are hereby empowered to fix such rules and regulations as may be by them deemed best for the successful attainment of the object for which said station is to be established and maintained. They shall also appoint three resident trustees, who shall act without compensation, except when it becomes necessary they may be allowed traveling expenses in attending to the discharge of their duties.

SEC. 48. The object of this agricultural station shall be to determine the adaptability of crops of grain, grasses, root crops, and all other growths which may grow in this latitude: also the most economical method of producing the best results in growing such crops with and without irrigation. And in aid of these objects the board of agriculture may select land (not to exceed 200 acres) in the San Luis Valley out of the State lands there found for this purpose, and shall appoint three local trustees for the management of the same. And in aid of these objects the board of agriculture may select land (not to exceed 200 acres) in the Arkansas Valley, in the county of Bent, out of the State lands there found for this purpose, and shall appoint three local trustees for the management of the same. And in further aid of these objects the board of agriculture may select lands to the extent of 200 acres in the valley of Uncompahgre River, or the valley of the Gunnison River, or the valley of the North Fork of the Gunnison River, in Delta County, State of Colorado, for the purpose of an experimental agricultural station as herein provided, and shall appoint three local trustees to manage the same, such lands to be selected from State lands or secured by purchase, gift, or donation, as the board of agriculture may decide.

SEC. 49. The proceeds arising from the sale of products of said farms shall be applied in the liquidation of the running expenses, and all moneys so accruing

shall be credited as coming from the State and be applied as part or whole payment of any amount which may be appropriated from the funds of the State for the maintenance of said farm or station.

SEC. 50. To enable the State board of agriculture to carry out the provisions of this act, they are hereby authorized to expend such amount as they may deem necessary, in establishing the above-described stations, out of any moneys which may accrue to the State by action of the Congress of the United States for the purpose of establishing agricultural experiment stations in the various States and Territories of the United States.

SEC. 50a. That for the furtherance and promotion of the agricultural interests of this State an agricultural experiment station shall be established in the eastern half of Cheyenne County, the precise location to be determined as hereinafter provided.

SEC. 50b. The State board of agriculture is authorized to select the necessary lands and secure the same by gift or donation, and to make all necessary improvements in the way of buildings and fences, and to take such steps as they may deem necessary to successfully establish said station: *Provided*, That a site, containing not less than one quarter section of land, and \$1,200 for equipping said station, be donated for this purpose by the community in which the same is located; and for the purpose of erecting said buildings and fences and of making all other necessary improvements for said station the sum of \$2,500 is hereby appropriated out of the internal permanent improvement fund of the State.

SEC. 50c. The State board of agriculture shall have absolute control and supervision of said farm. They shall appoint a superintendent and such other officers and employees as they may deem necessary to carry on successfully the said farm. They shall have power to fix salaries and all compensation of employees and they are hereby empowered to make such rules and regulations as may to them appear necessary and expedient. They shall appoint three resident trustees, who shall act without compensation, except, when it becomes necessary, they may be allowed traveling expenses in the discharge of their duties.

SEC. 50d. The object of this agricultural experiment station shall be to determine the adaptability of crops of grain, grasses, root crops, and all other growths which may grow in this latitude; also the most economical methods of producing the best results in growing such crops without irrigation.

SEC. 50e. The proceeds arising from the sale of the products of said farm and from all other sources shall be paid to the treasurer of the board, and by the board disbursed for the use and benefit of said station.

SEC. 50f. To enable the State board of agriculture to carry out the provisions of this act, they are hereby authorized to expend such amount as they may deem necessary, in establishing the above-described station, out of any moneys which may accrue to the State by the action of Congress of the United States for the purpose of establishing agricultural experiment stations in the various States and Territories of the United States.

SEC. 51. That full and complete acceptance, ratification, and assent is hereby made and given by the State of Colorado to all of the provisions, terms, grants, and conditions, and purposes of the grants made and prescribed by the act of the Congress of the United States entitled "An act to establish agricultural experiment stations in connection with the colleges established in the several States under the provisions of an act approved July 2, 1862, and of the acts supplementary thereto."

SEC. 52. The State board of agriculture shall have the control of the fund appropriated by the said act of Congress, and shall disburse the same for the use and benefit of the agricultural experiment station department of the State agricultural college, and in accordance with the terms and provisions of said act of Congress.

SEC. 52a. Full and complete acceptance, ratification, and assent is hereby made and given by the State of Colorado to all of the provisions, terms, grants, and conditions, and purposes of the grants made and prescribed by the act of Congress of the United States entitled "An act to apply a portion of the proceeds of the public lands to the more complete endowment and support of the colleges for the benefit of agriculture and the mechanic arts established under the provisions of an act of Congress approved July 2, 1862."

SEC. 52b. The State board of agriculture shall have the control of the fund appropriated by the said act of Congress, and shall disburse the same for the use and benefit of the State agricultural college, and in accordance with the terms and provisions of said act of Congress.

## CONNECTICUT.

[The following matter is taken from the General Statutes of Connecticut, Revision of 1887, published by the authority of the State, Hartford, Conn.]

SEC. 2252. Any person who shall give credit to a minor student of any college or university of this State without the written consent of his parent or guardian, or of an authorized officer of such institution, shall be fined not less than \$20 nor more than \$300.

SEC. 2253. (Repealed by act 1889, Chap. LII, q. v.) The bonds of this State indorsed and known as agricultural college bonds, and constituting the capital of the agricultural college fund, shall not be transferable except by a special act of the general assembly, but shall remain in the custody of the commissioner of the school fund; and the treasurer and said commissioner are hereby authorized to invest any money now in their hands, or that hereafter may come into their hands, belonging to the principal of said fund in any securities, except personal securities, in which by law the savings banks of this State may invest. Said commissioner shall semiannually receive and pay over the interest accruing upon said fund to the president and fellows of Yale College, for the purposes and on the conditions hereinafter set forth; and the treasurer shall pay interest at the rate of 5 per cent per annum on the principal of the agricultural college fund remaining in the treasury uninvested.

SEC. 2254. Said corporation shall devote the interest upon said fund wholly and exclusively to the maintenance, in that department of Yale College known as the Sheffield Scientific School, of such courses of instruction as shall carry out the intent of the act of Congress entitled "An act donating public lands to the several States and Territories which may provide colleges for the benefit of agriculture and the mechanic arts," approved July 2, 1862, in the manner specially prescribed in the fourth section of said act.

SEC. 2255. Said corporation shall furnish gratuitous education in said courses of instruction to such citizens of this State as shall be annually nominated to be pupils of said school, in such manner as the general assembly shall prescribe. Their number shall be, in each year, such as would expend a sum equal to half said interest for the same year, in paying for their instruction in said school, if they were required to pay for it at the regular rates charged to its other pupils for the same year. Said pupils, so nominated and received, shall be admitted into said school upon the same terms and subject to the same rules and discipline which shall apply to all its other pupils, except that they shall pay nothing for their instruction.

SEC. 2256. Said corporation shall annually make up and distribute the reports required by the fourth paragraph of the fifth section of the act of Congress designated in section 2254.

SEC. 2257. The governor, lieutenant-governor, the three senior senators, and the secretary of the board of education shall constitute a board of visitors, who shall visit said school in each year, and report thereon to the general assembly at each regular session.

SEC. 2258. Said visitors, with the secretary of the Sheffield Scientific School, shall constitute an appointing board, who shall select from such candidates as shall offer themselves those who shall be entitled to receive the gratuitous instruction in said school.

SEC. 2259. If there are more applications for the bounty of the State than there are vacancies to be filled on the part of the State, said board shall give the preference to such young men as are fitting themselves for agricultural, mechanical, or manufacturing occupations in life, and may have become orphans through the death of a parent in the naval or military service of the United States, and next to them, to such as are most in need of pecuniary assistance; and shall provide that the appointments shall be distributed, as far as practicable, among the several counties of the State, in proportion to their population.

SEC. 2260. The secretary of said school shall also be the secretary of said appointing board, and shall record their transactions, and shall, at least one month before the close of each academic year in said school, cause to be published in at least one newspaper in every county in this State an advertisement specifying the number of pupils entitled by law to be admitted into said school for gratuitous instruction during the ensuing academic year, and designating the time and manner in which application for admission may be made to said appointing board.

SEC. 1716. [Amended by section 2 of act of 1893, Chapter LXVII, also by act of 1899, chapter 169.] The Storrs Agricultural School shall remain an institution for the education of boys whose parents are citizens of this State in such branches of

scientific knowledge as shall tend to increase their proficiency in the business of agriculture.

SEC. 1717. [See act 1901, chapter 70.] There shall be appointed by the senate six trustees of said school. During the session of the general assembly of 1889 the senate shall appoint three of said trustees who shall hold office for four years, and three who shall hold office for two years, and biennially thereafter three trustees shall be so appointed, who shall hold office for the term of four years from and after the 1st day of July next succeeding their appointment. The Connecticut board of agriculture shall also annually elect a trustee, and the director of the Connecticut Agricultural Experiment Station shall be ex officio one of said trustees.

SEC. 1718. Said board of trustees are empowered to take and hold in behalf of the State of Connecticut deeds of such lands and other property and such money as may be donated for the purpose of establishing and maintaining said school.

SEC. 1719. To said board of trustees shall be committed the location of said school, the application of the funds for the support thereof, the appointment of managers and teachers, and the removal of the same, the power to prescribe the studies and exercises of pupils in said school, rules for its management, and the admission of pupils; and they shall annually report to the governor the condition of said school, and such annual reports shall be submitted to the general assembly at its regular sessions.

SEC. 331. [See Public Acts, 1899, chapter 147 post.] The comptroller shall cause to be printed, at the expense of the State, annually such numbers of copies of each of the following annual reports as is hereinafter stated; that is to say: \* \* \* of the Storrs Agricultural School, 1,000; \* \* \* of the report of the board of visitors of the Sheffield Scientific School, 1,000 copies.

SEC. 330. The estimates for the different classes of expenditures shall be made as follows, to wit: \* \* \* for the State board of agriculture, the State experiment station, the Storrs Agricultural School, \* \* \* by the secretary of the State board of agriculture.

SEC. 1710. The Connecticut Agricultural Experiment Station shall remain as now established, and its management shall be committed to a board of control, to consist of eight members, one member to be selected by the State board of agriculture, one member by the State Agricultural Society, one member by the governing board of the Sheffield Scientific School at New Haven, one member by the board of trustees of the Wesleyan University at Middletown, and two members to be appointed by the governor. The governor and the person appointed, as hereinafter provided, to be the director of the station shall also be ex officio members of the board of control, and the members of the board shall continue in office for the term of three years from the 1st day of July next succeeding their appointment.

SEC. 1711. Said board shall choose from among their number a secretary and a treasurer, each of whom shall be elected annually, and shall hold their respective offices one year, and until the choice of their successors. Five members of said board shall constitute a quorum.

SEC. 1712. Said board shall meet annually on the third Tuesday in January in each year, at such place in the city of Hartford as may be designated by the president of said board, and at such other times and places, upon the call of the president, as may be deemed necessary, and may fill vacancies which may occur in the offices of said board.

SEC. 1713. Said board of control shall locate and have the general management of the institution, and shall appoint a director, who shall have the general management and oversight of the experiments and investigations which shall be necessary to accomplish the objects of said institution, and shall employ competent and suitable chemists and other persons necessary to the carrying on of the work of the station. It shall have power to own such real and personal estate as may be necessary for carrying on its work, and to receive title to the same by deed, devise, or bequest. It shall expend all moneys appropriated by the State in the prosecution of the work for which said institution is established, and shall use for the same purpose the income from all funds and endowments which it may receive from other sources, and may sue and be sued, plead and be impleaded in all courts by the name of The Connecticut Agricultural Experiment Station. It shall make an annual report to the governor, which shall not exceed 200 [400 by act of 1893, Ch. XVIII] printed pages, and such annual reports shall be submitted to the general assembly at its regular sessions.

SEC. 1714. The sum of \$8,000 annually is hereby appropriated to said Connecticut Agricultural Experiment Station, which shall be paid in equal quarterly installments to the treasurer of said board of control upon the order of the comp-

troller, who is hereby directed to draw his order for the same; and the treasurer of said board of control shall be required, before entering upon the duties of his office, to give a bond with surety to the treasurer of the State of Connecticut in the sum of \$10,000 for the faithful discharge of his duties as such treasurer.

SEC. 1715. Upon the death or resignation of any of the members of the board of control the authority or institution by which such deceased member was originally appointed shall fill the vacancy so occasioned.

SEC. 4005. Every person or company who shall sell, offer, or expose for sale in this State any commercial fertilizer or manure the retail price of which is \$10 or more than \$10 per ton shall affix conspicuously to every package thereof a plainly printed statement, clearly and truly certifying the number of net pounds of fertilizer in the package, the name, brand, or trade-mark under which the fertilizer is sold, the name and address of the manufacturer, the place of manufacture, and the chemical composition of the fertilizer expressed in the terms and manner approved and currently employed by the Connecticut Agricultural Experiment Station. If any such fertilizer be sold in bulk, such printed statement shall accompany every lot and parcel sold, offered, or exposed for sale.

SEC. 4006. Before any commercial fertilizer the retail price of which is \$10 or more than \$10 per ton is sold, offered, or exposed for sale the manufacturer, importer, or party who causes it to be sold or offered for sale within this State shall file with the director of the Connecticut Agricultural Experiment Station two certified copies of the statement named in the preceding section, and shall deposit with said director a sealed glass jar or bottle containing not less than one pound of the fertilizer, accompanied by an affidavit that it is a fair average sample thereof.

SEC. 4007. The manufacturer, importer, agent, or seller of any commercial fertilizer the retail price of which is \$10 or more than \$10 per ton shall pay, on or before the 1st of May annually, to the director of the Connecticut Agricultural Experiment Station an analysis fee of \$10 for each of the fertilizing ingredients contained or claimed to exist in said fertilizer: *Provided*, That when the manufacturer or importer shall have paid the fee required for any persons acting as agents or sellers for such manufacturer or importer, such agents or sellers shall not be required to pay the fee named in this section.

SEC. 4008. Every person in this State who sells or acts as local agent for the sale of any commercial fertilizer of whatever kind or price shall annually or at the time of becoming such seller or agent, report to the director of the Connecticut Agricultural Experiment Station his name, residence, and post-office address, and the name and brand of said fertilizer, with the name and address of the manufacturer, importer, or party from whom such fertilizer was obtained, and shall on demand of the director of the Connecticut Agricultural Experiment Station deliver to said director a sample suitable for analysis of any such fertilizer or manure then and there sold or offered for sale by said seller or agent.

SEC. 4009. No person or party shall sell, offer, or expose for sale in this State any pulverized leather, raw, steamed, roasted, or in any form, as a fertilizer or as an ingredient of any fertilizer or manure, without explicit printed certificate of the fact, such certificate to be conspicuously affixed to every package of such fertilizer or manure, and to accompany every parcel or lot of the same.

SEC. 4010. Every manufacturer of fish guano, or fertilizers of which the principal ingredient is fish or fish mass from which the oil has been extracted, shall, before manufacturing or heating the same and within thirty-six hours from the time such fish or mass has been delivered to him, treat the same with sulphuric acid or other chemical approved by the director of said experiment station in such quantity as to arrest decomposition: *Provided, however*, That in lieu of such treatment such manufacturers may provide a means for consuming all smoke and vapors arising from such fertilizers during the process of manufacture.

SEC. 4011. Any person violating any provision of the foregoing sections of this chapter shall be fined \$100 for the first offense and \$200 for each subsequent violation.

SEC. 4012. This chapter shall not affect parties manufacturing or purchasing fertilizers for their own private use and not to sell in this State.

SEC. 4013. The director of the Connecticut Agricultural Experiment Station shall pay the analysis fees received by him into the treasury of the station, and shall cause one or more analyses of each fertilizer to be made and published annually. Said director is hereby authorized, in person or by deputy, to take samples for analysis from any lot or package of manure or fertilizer which may be in the possession of any dealer.

SEC. 4014. The director of the Connecticut Agricultural Experiment Station

shall, from time to time, as bulletins of said station may be issued, mail or cause to be mailed two copies, at least, of such bulletins to each post-office in the State.

Public Acts 1889, Chapter LII: SECTION 1. The treasurer and the commissioner of the school fund shall invest the principal of the agricultural-college fund of this State in any securities, except personal securities, in which by law the savings banks of this State may invest, and said commissioner shall have the custody of all securities belonging to said fund, and shall cause a schedule of the same to be made and registered in books kept in his office. He shall receive all payments on account of said fund, receipt therefor, and deposit the same with the treasurer, taking said treasurer's receipt for the same, and he shall draw all orders upon its principal and receive from the treasurer, at least semiannually, all income so deposited and transmit the same to the president and fellows of Yale College for the purposes and conditions set forth in chapter 143 of the general statutes. The treasurer shall pay interest at the rate of 5 per cent per annum on the principal of said fund remaining in the treasury uninvested, and all expenses incurred in the management of said fund shall be paid from the treasury upon the order of said commissioner.

SEC. 2. Section 2253 of the general statutes is hereby repealed.

Ibid., Chapter XII: SECTION 1. The annual report of the Storrs School Agricultural Experiment Station shall be printed, bound and circulated as now provided by law for the annual report of the Connecticut Agricultural Experiment Station at New Haven.

Public Acts 1893, Chapter LXVII: The name of the Storrs Agricultural School is hereby changed to The Storrs Agricultural College, by which name it shall hereafter be known and called.

SEC. 2. Section 1716a of the general statutes is amended to read as follows: "The Storrs Agricultural College is hereby established, and shall remain an institution for the education of youth whose parent or parents are citizens of this State; and the leading object of said college shall be, without excluding other scientific and classical studies, and including military tactics, to teach such branches of learning as are related to agriculture and the mechanic arts, in such manner as the general assembly of this State shall prescribe, in order to promote the liberal and practical education of the industrial classes in accordance with the provisions of an act of Congress approved July 2, 1862. \* \* \* also in accordance with an act of Congress approved August 30, 1890."

SEC. 3. Sections 1717, 1718, and 1719 of the general statutes are amended by striking out the word "school" whenever it occurs and inserting the word "college."

SEC. 4. Section 2253 of the general statutes [confer section 2 of act of 1889, Chapter LII] is amended to read as follows: "The bonds of this State indorsed and known as agricultural college bonds and constituting the capital of the agricultural college fund, with all funds heretofore and hereafter received from the United States under an act of Congress approved July 2, 1862, shall not be transferable except by special act of the general assembly, but shall remain in the custody of the commissioner of the school fund; and the treasurer and said commissioner are hereby authorized to invest any money now in their hands, or that may hereafter come into their hands, belonging to the principal of said fund, in any securities, except personal securities, in which by law the savings banks of the State may invest, and said commissioner shall semiannually receive and pay over the interest accruing from said fund to the treasurer of this State, who shall semiannually pay over the interest accruing from said fund, and also the amount received by virtue of an act of Congress approved August 30, 1890, to Yale University and to the board of trustees of the Storrs Agricultural College, in such proportions and for the purposes and on the conditions set forth in the succeeding sections; and the treasurer shall pay interest, at the rate of 5 per cent per annum, on the principal of such funds remaining in the treasury uninvested."

SEC. 5. The corporation of Yale University shall, upon the passage of this act, and semiannually thereafter, report under oath to the treasurer of the State the number of pupils in attendance at Sheffield Scientific School who had, previous to the passage of this act, been admitted as gratuitous pupils under the agreement between Yale College and the general assembly of this State, as approved by Governor Buckingham September 3, 1863, and thereupon the said treasurer shall pay over to Yale University a sum equal to twice the amount such pupils would be required to pay at the regular rates charged other pupils of the said school.

SEC. 6. After the passage of this act no further nominations or appointments of State pupils to the said Sheffield Scientific School shall be made, and no portion of the interest accruing from the said act of Congress, approved July 2, 1862, and

no part of the proceeds of the act of Congress of 1890 shall be paid over to said corporation of Yale University, except as provided in section 5 of this act, until said corporation shall contract in writing, in such form as the governor shall approve, to fulfill and perform all the duties and obligations imposed upon it by this act.

SEC. 7. After the passage of this act said corporation of Yale University shall furnish gratuitous education in such courses of instruction as, including the courses of instruction already instituted in said school, shall carry out the intent of the aforesaid act of Congress, approved July 2, 1862, in the manner especially prescribed by the fourth section of said act.

SEC. 8. Said corporation shall furnish gratuitous education in said courses of instruction to pupils who shall be annually nominated to be pupils of said school in the manner prescribed by law. The number of pupils to be so received gratuitously into said school shall be in each year such a number as would expend a sum equal to the interest on the proceeds of the aforesaid act of Congress approved July 2, 1862, for the same year, in paying for their instruction in said school if they were required to pay for it at the regular rates charged to other pupils of said school for the same year. Said pupils shall be citizens of this State, and shall be admitted into said school upon the same terms and subject to the same rules and discipline which shall apply to all other pupils of said school, with the single exception that they shall not be required to pay anything for their instruction.

SEC. 9. All the interest and funds arising from the said acts of Congress of 1862 and 1890 not paid over to Yale University by the provisions of this act shall by said State treasurer be paid over to the trustees of the Storrs Agricultural College for the use of said college in the manner heretofore provided by law.

SEC. 10. Should any question of damages, growing out of the provisions of this act, arise between the corporation of Yale University and the State of Connecticut, such question of damages shall be referred to three commissioners, one to be selected by the General Assembly of this State, one to be selected by the corporation of Yale University, and a third commissioner to be agreed upon by the two first mentioned, or, in case of their disagreement, the third commissioner shall, upon application thereto by the other commissioners, be appointed by the chief justice of the supreme court of errors of this State, and the decision of said commissioners, or of any two of them, in writing, shall be final, and their award shall, if in favor of Yale University, constitute a claim against the State. The comptroller is hereby authorized and directed to draw his order upon the treasurer in favor of Yale University for the amount of such award, which shall be paid from the sum appropriated for general purposes.

SEC. 11. The State of Connecticut hereby assents to and agrees that said moneys shall be expended in accordance with the provisions of said act.

SEC. 12. Said corporation of Yale University and the trustees of the Storrs Agricultural College shall annually make and distribute the reports called for by the aforesaid acts of Congress.

SEC. 13. All acts and parts of acts inconsistent herewith are hereby repealed.

[Yale University called for the constituting of the commission provided for in section 10 of the above act. The commission in January, 1896, rendered a decision awarding damages to Yale University to the amount of \$154,604.45, equivalent to the entire fund received by the State of Connecticut under the act of July 2, 1862, together with the interest on that sum from the time of the legislative act of 1893 to the date of the decision of the commissioners. The income from the funds received under the act of July 2, 1862, as well as the entire funds granted to the State of Connecticut under the act of August 30, 1890, are now paid to the Connecticut Agricultural College.]

Public Acts 1893, Chapter CCXXVI: SECTION 1. The sum of \$1,800 annually is hereby appropriated to the Storrs Agricultural College Experiment Station for the purpose of investigating the economy of the food and nutrition of man, and for investigations of the bacteria of milk, butter, and cheese, and their effect in the dairy, and the said sum shall be paid in equal quarterly installments to the treasurer of the Storrs Agricultural College Experiment Station, and the comptroller is hereby directed to draw his order for the same.

Public acts, 1899, chapter 169: SECTION 1. The name of the Storrs Agricultural College is hereby changed to that of the Connecticut Agricultural College, and said college shall, under said new name, have, own, and enjoy all property and rights of said Storrs Agricultural College, and shall be subject to all laws applicable to said Storrs Agricultural College, and the management of said college shall continue as at present until changed by proper authority. Whenever a library building shall be erected upon the grounds of said college such library shall be named the "Storrs Memorial Library," and shall bear that name conspicuously both exteriorly and interiorly.

SEC. 3. [Repealed by section 2, chapter 70, acts 1901.] There shall be a trustee of the Connecticut Agricultural College in addition to those now provided by law, who shall be elected for a term of four years \* \* \* by and from the graduates of said institution, the election to be under the supervision of the trustees for the time being and to be so conducted that all graduates shall have an opportunity to vote therein by signed ballots deposited personally or by letter.

Public acts, 1895 [1899], Chapter CCXXXV, as amended by the act of 1899, chapter 22: The Connecticut Agricultural Experiment Station shall make analyses of food products on sale in Connecticut or kept in Connecticut for export, to be sold without the State, suspected of being adulterated. Samples of food products for analysis shall be taken by the duly authorized agents of the station or by the dairy commissioner or his deputy, at such times and places and to such an extent as in the judgment of the officers of said experiment station and of the dairy commissioner shall seem expedient. The dairy commissioner or his deputy shall have full access at all reasonable hours to any place wherein it is suspected that there is kept for sale or for export, as above specified, any article of food adulterated with any deleterious or foreign ingredient or ingredients, and said dairy commissioner or his deputy, upon tendering the market price of such article, may take from any person, firm, or corporation samples of the same. The said experiment station may adopt or fix standards of purity, quality, or strength, when such standards are not specified by law. Whenever said experiment station shall find by its analysis that adulterated food products have been on sale in the State, or kept in the State for export for sale without the State, it shall forthwith transmit the facts so found to the dairy commissioner, who shall make complaint to the proper prosecuting officer to the end that violators of the law relating to the adulteration of food products shall be prosecuted.

Public acts, 1899, chapter 147: Five thousand copies of the annual report of the State board of agriculture shall be printed at the expense of the State. The reports of the Connecticut Agricultural Experiment Station and the Storrs Agricultural Experiment Station shall be eliminated from the report of the State board of agriculture; 7,000 copies of the report of the Connecticut Agricultural Experiment Station and 7,000 copies of the report of the Storrs Agricultural Experiment Station, not to exceed 400 pages each or the equivalent thereof in paper, pages, and printing in the form of a smaller report and a series of popular bulletins, shall be printed at the expense of the State.

Public Acts, 1901, chapter 70: SECTION 1. There shall be a trustee of the Connecticut Agricultural College in addition to those now provided by law to be known as the alumni trustee, who shall be a graduate of the institution of at least five years' standing, and who shall be elected at the college during commencement week for a term of two years \* \* \* by the graduates of said institution. The election shall be under the supervision of a canvassing board, to consist of three members, one appointed by the board of trustees, one by the alumni association of the college, and one to be selected by the two aforesaid, and to be so conducted that all graduates shall have opportunity to vote therein by signed ballots deposited personally or by letter.

SEC. 2. Section 3 of chapter 169, 1899, is hereby repealed. [This act taking its place.]

Public acts, 1901, chapter 175: SECTION 1. The board of control of the Connecticut Agricultural Experiment Station at New Haven shall designate and appoint a man qualified by scientific training and practical experience to be State forester during the pleasure of the board, and to be responsible to said board for the performance of his duties as prescribed in this act. The State forester shall have an office at the experiment station in New Haven, but shall receive no compensation other than his regular salary as a member of the station staff of deputies or aids, as may be necessary.

SEC. 2. The State forester is authorized to buy land in the State suitable for the growth of oak, pine, or chestnut lumber, at a price not exceeding \$4 per acre, to the amount of the appropriation hereinafter named, which land shall be deeded to the State of Connecticut and shall be called a State park.

SEC. 3. The State forester is authorized to plant the lands so bought with seed or seedlings of oak, pine, and chestnut and such other trees as he may deem necessary or expedient, at a cost not exceeding \$2.50 an acre; to exchange the land so bought with adjoining proprietors, if desirable, in order to make the State park more compact for fencing, and for and in behalf of the State to execute deeds for such purpose; to fence such lands with substantial wire fencing, not barbed, and to use proper precautions to protect said lands from forest fires, from trespassers, and the destruction of game, fish, and timber thereon, and in so doing may employ such local wardens or assistants as may be necessary.

SEC. 4. The State forester shall be the lawful custodian of such lands, with power to enter complaint against trespassers thereon, and shall pay, from the sum hereinafter appropriated, the town taxes upon said land when assessed at the same rate as similar adjoining lands, and with the approval of the governor and the attorney-general may sell portions of the same when they shall command a greater price than the cost and interest thereon, and may execute a deed for the sale for and in behalf of the State.

SEC. 5. The sum of \$2,000 for the two fiscal years ending September 30, 1903, is hereby appropriated for carrying out the provisions of this act.

SEC. 6. The accounts of the forester for all disbursements under the provisions of this act shall be paid by the comptroller upon the audit of the State board of control.

#### DELAWARE.

[The following matter is taken from the Revised Statutes of the State of Delaware, published at Wilmington, 1893.]

Chapter XLIII (chap. 513, vol. 13, Laws of Delaware): Delaware College. SECTION 1. Delaware College at Newark, reincorporated by act of February 10, 1851, for a period of twenty years, is hereby recognized and reincorporated as a college for another period of twenty years, from and after the 10th day of February, A. D. 1871.

SEC. 2. The leading object of said college shall be, without excluding other scientific and classical studies, and including military tactics, to teach such branches of learning as are related to agriculture and the mechanic arts, in order to promote the liberal and practical education of the industrial classes in the several pursuits and professions in life.

SEC. 3. The board of trustees of said college shall consist of 30 members, together with the governor of the State and the president of the college, who shall be members ex officio, one-half of whom shall be appointed by the governor, who shall fill vacancies which may hereafter occur in their number, and the other half shall be appointed by the remaining members of the present board, who shall have power to fill vacancies occurring in their number; and the joint board so constituted shall have the entire control and management of the affairs of the college, with power to appoint and remove all subordinate officers and agents, and to make by-laws as well for their own government as that of the college.

SEC. 4. There shall be two stated meetings of the board every year at such time and place as may be fixed by the by-laws, and occasional meetings may be held on the call of the president, which he may make at discretion, and shall make on the written request of any two or more members of the board of trustees. The secretary of the board shall give two weeks' written notice of all meetings, and the time, place, and purpose of occasional meetings shall be stated in the notice thereof, and the proceedings of such meetings shall be confined strictly to the purpose stated therein.

SEC. 5. Nine members of the board shall constitute a quorum to do business, but a less number may adjourn. Officers may be appointed for the occasion in the absence of the regular officers. The place of a trustee who shall be absent from three successive stated meetings shall be vacated, unless the board shall otherwise especially direct, and a vacancy thus created shall be filled as in other cases. And a trustee appointed and not accepting at or before the next stated meeting shall be considered as declining, and a new appointment made.

SEC. 6. The trustees, as ascertained and limited by this act, shall continue to be a corporation by the name of the trustees of Delaware College, with all the powers and franchises incident to such an institution, including the capacity to take and hold real and personal estate, not exceeding in annual value \$50,000, by deed, devise, bequest, gift, grant, or otherwise, and the same to alien, sell, transfer, or dispose of as occasion may require, and the proceeds thereof to be reinvested in other property, funds, or securities for the benefit of said college, and in accordance with the spirit and purpose of this act.

SEC. 7. The faculty, consisting of the professors and tutors employed by the board of trustees, one of whom shall be president of the college, shall have the care, control, government, and instruction of the students, subject, however, to the by-laws. They shall have authority, with the approbation of the board of trustees, to confer degrees and grant diplomas.

SEC. 8. The college fund, created by resolution of the general assembly of January 28, 1834, and transferred by act of February 5, 1833, to "the trustees of Newark College," and all other funds, stock, money, or property belonging to or appropriated for, or raised, paid, or payable to the trustees of Delaware College,

by that or any other name, shall be a part of the endowment of said college and shall be held, appropriated, and used as such by the said trustees.

SEC. 9. Devises, bequests, gifts, and grants to the corporation shall not be avoided by any misnomer if the description can be understood with reasonable certainty. And the corporation shall not be dissolved by nonuser so long as there shall remain seven trustees. The secretary of state shall transmit to the president of Delaware College, to be kept and placed in the library, a copy of all public documents of which he may receive duplicates, whenever the same shall not have been already appropriated. This college shall never be managed or conducted in the interest of any party, sect, or denomination, and the trustees of said college shall make a report of its condition to the legislature at each regular biennial session. (February 17, 1869.)

Chapter 48, volume 14, Laws of Delaware: SEC. 2. It shall not be lawful for any person, whether licensed to sell spirituous and fermented liquors or not, to sell, dispose of, barter, or give to, or be instrumental in procuring for any student of Delaware College, within 2 miles of the said college, any spirituous or fermented liquors or cordials of any kind in any quantity whatever, and any person violating the provisions of this section shall be liable to a fine of \$35 for the first offense, and \$50 for the second offense, and \$100 for every subsequent offense, and shall be imprisoned until the said fines and costs shall be paid; the fines herein incurred to be collected as similar fines are now collected by law, one-half to be paid over to the informer and the other half to go to the constable or officer serving the warrant. (March 2, 1871.)

Chapter 408, volume 14, Laws of Delaware: SECTION 1. The treasurer of this State is hereby authorized and required to pay over to the treasurer of the board of trustees of Delaware College the sum of \$3,000 per annum for the period of two years, in equal quarterly installments, the first installment to be paid on the 1st day of October, 1873: *Provided*, That whenever the college shall receive additional aid from the General Government this appropriation shall cease.

SEC. 2. In consideration of the appropriation herein made, the trustees of Delaware College shall provide free instruction of a suitable character for 10 students from each county of the State whenever such students, on presenting themselves for admission, shall obligate themselves to teach in the free schools of the State for not less than one year.

SEC. 3. Until otherwise provided by law, the appointments to the free scholarships herein established shall be made by the members of the legislature, each senator and representative being entitled to make one appointment. (March 27, 1873.)

Chapter 625, volume 18, Laws of Delaware: Delaware College, at Newark, Del., reincorporated by act of February 17, 1869, for a period of twenty years from February 10, 1871, be, and the same is hereby, reincorporated as a college, with the same duties, privileges, and prerogatives as now legally enjoyed and exercised by that institution for a further period of twenty years from and after the 10th day of February, 1889. (February 21, 1889.)

Chapter 137, volume 13, Laws of Delaware [see law of February 17, 1869, the first of this collection]: Whereas the legislature of this State by a recent act accepted the provisions of an act of Congress approved July 2, 1862; and whereas the said act of Congress renders it the duty of the State to provide the buildings, grounds, and appliances necessary to carry out the objects of said act; and whereas the board of trustees of Delaware College have proposed to convey to the State of Delaware a joint and equal interest in the grounds, buildings, libraries, apparatus, and vested fund of said college property, upon the condition that the State shall vest the income to be derived from the sale of the said lands in a board of trustees, not more than one-half of whom shall be the representatives of the State, and the remainder the representatives of the present board, for the purpose of establishing at Newark, in connection with said college, an institution which shall meet the requirements of the act of Congress and extend to the people of our State the benefits of its provisions:

SECTION 1. The proposition of the board of trustees of Delaware College is hereby accepted and Delaware College is adopted and established as the institution to be provided by the State of Delaware in accordance with the provisions of the act of Congress approved July 2, 1862.

SEC. 2. The State treasurer, in conjunction with the governor of the State and the president of the board of trustees of Delaware College, is hereby authorized and required to sell and assign, upon such terms and conditions as they may deem best for the interest of the State of Delaware, the whole or any part of the scrip or land warrants issued or to be issued to the State by virtue of said act of Congress.

SEC. 3. The proceeds of the sale or sales aforesaid shall be invested by the said treasurer in interest-bearing bonds of this State or of the United States, at his discretion, the principal of which bonds shall be forever held sacred for the purposes contemplated in the act of Congress aforesaid, and shall not be transferable except by a special act of the legislature.

SEC. 4. The State treasurer may perform and discharge any of the acts, trusts, or duties authorized, directed, or conferred herein by any agent or agents by him selected and appointed, and with the consent and advice of the governor of the State. All costs and expenses incurred in selling or assigning the said land scrip, or investing the proceeds thereof, shall be allowed and paid out of any funds in the State treasury not otherwise appropriated.

SEC. 5. The State treasurer shall, semiannually, receive and pay over the interest of said bonds to the treasurer of the board of trustees of Delaware College for the purposes and on the conditions hereinafter mentioned.

SEC. 6. The board of trustees of Delaware College shall devote said interest to the maintenance of such course or courses of instruction in said college as shall carry out the intent of the act of Congress aforesaid, and shall provide for the gratuitous instruction of one pupil from each hundred in the State, who shall be annually nominated to be pupils of said college in such manner as the legislature may prescribe. Said pupils, so nominated and received, shall be residents of this State, and shall be admitted into said college upon the same terms and subject to the same rules and discipline which shall apply to all other pupils of said college, with the single exception that they shall not be required to pay anything for their instruction.

SEC. 7. Said board of trustees shall, annually, on or before the 1st day of February in each and every year, make up and distribute the reports required by the fourth paragraph of the fifth section of the said act of Congress.

SEC. 8. The governor is hereby authorized to appoint five trustees from each county of the State to be members of the board of trustees of Delaware College on behalf of the State, and to fill all vacancies which may arise in such appointments, occasioned by death, resignation, or otherwise, and that the present board of trustees of Delaware College shall fill up the remaining vacancies in said board in the manner and to the number prescribed in the charter of Delaware College, as well as to fill any vacancies which may hereafter arise in their number, and the joint board of trustees thus reorganized shall have the entire control and management of said institution, subject to the provisions of its charter and the terms of the act: *Provided*, That said institution shall never be managed or conducted in the interests of any party, sect, or denomination.

SEC. 9. The board of trustees of Delaware College shall report such amendments to this act, or such further acts or laws, as they may deem necessary and proper to carry out the objects contemplated by this act. (March 14, 1867.)

Chapter 420, volume 13, Laws of Delaware: SECTION 1. The number of students from each county shall not exceed [ten from each county]. Each hundred in each county shall have an equal number of the appointees to the college established by the act passed March 14, 1867 [above], and in making the nominations of the pupils under the act aforesaid hereafter, the hundred as herein named shall always be construed to mean such territory as was embraced within the limits of the respective hundreds in each county at the time the counties were each embraced within limits of ten hundreds only.

SEC. 2. They shall be nominated in this manner: Each member of the general assembly for the time being, whether during a session or in vacation, as occasion may require, shall nominate the students to which his or their hundred shall be entitled, and nominations from hundreds within the meaning of this act shall be made whenever a vacancy occurs in a hundred by nonacceptance, death, or otherwise. When there are two or more members of the general assembly from one hundred, they shall decide who shall nominate from the hundred or hundreds, within the meaning of this act, having no resident member, together with the hundred where they may reside, by writing the names of the hundreds on separate paper and drawing as by lot; the hundred which a member may so draw, the same shall be his, so drawing, to nominate therefrom during his term.

SEC. 3. No person shall be nominated on the part of the State as a student of Delaware College who is under the age of 16 years or over 21. (March 15, 1869.)

Chapter 55, volume 14, Laws of Delaware: SECTION 1. A. B., late State treasurer and trustee of the funds arising from the sale of the land scrip mentioned in the act (March 14, 1867) to which this is a supplement, is hereby directed to transfer and deliver to the State treasurer all the funds, bonds, and other securities, as well as any scrip yet in his hands or under his control, if any, taking his receipt

therefor; and the State treasurer shall, when received by him, hold and be accountable for them in his official capacity.

SEC. 2. It shall be the duty of the State treasurer, in addition to the other duties imposed by the act to which this is a supplement, to keep said funds, bonds, and other securities and scrip in the Farmers' Bank, at Dover, and to keep a separate and distinct account of said trust funds, and to make a full and detailed report of the condition thereof to the trustees of Delaware College on the 1st day of July in each year, and also to the legislature at each biennial session. (March 30, 1871.)

Chapter 119, volume 19, Laws of Delaware:

SECTION 1. The governor of the State, on the first Tuesday in June, 1891, and every four years thereafter, shall appoint and commission two respectable and well-qualified persons from each county, who shall constitute the board of trustees for the [State] College for Colored Students. The said trustees shall hold their office for a period of four years or until their successors shall in like manner be appointed. In case of a vacancy by death, resignation, or otherwise, the governor shall appoint for the unexpired term.

SEC. 2. The trustees named in this act are hereby ordained and declared to be a body corporate by the name and style of "The Trustees of [the State] College for Colored Students," with all the powers and franchises incident to such an institution, including the capacity to take and hold real and personal estate by deed, devise, bequest, gift, grant, or otherwise, and the same to alien, sell, transfer, and dispose of as occasion may require, and the proceeds thereof to be reinvested in other property, funds, or securities for the benefit of said college, and in accordance with the spirit and purpose of this act.

SEC. 3. The purpose and object of said college shall be to impart instruction in agriculture, the mechanic arts, the English language, the various branches of mathematical, physical, natural and economic science, with special reference to their application in the industries of life, and to the facilities for such instruction, in order to promote the liberal and practical education of the industrial classes in the several pursuits and professions in life, but other scientific and classical studies may be taught, and a normal school for the preparation of teachers may be connected with the college under such rules and regulations as the trustees may adopt.

SEC. 4. The said board of trustees shall have the superintendence of said college, with power to appoint and remove the faculty and other officers and agents of the college and of their own body; to fill vacancies and to make by-laws as well for the government of the college as their own government, and to conduct all the concerns of the institution. [Four] members of the board shall constitute a quorum, and meetings of the board shall be held as the by-laws may prescribe: *Provided*, That said by-laws shall not conflict with the constitution or laws of the United States or of this State.

SEC. 5. The faculty of the college, composed of the teachers whom the trustees shall employ, one of whom shall be president of the college and ex officio member of the board of trustees, shall have the care, government, and instruction of the students, subject, however, to the by-laws. They shall have authority, with the approbation of the board of trustees, to confer degrees and grant diplomas.

SEC. 6. Devises, bequests, grants, and gifts to this corporation shall not be avoided by any misnomer, if the description can be understood with reasonable certainty.

SEC. 7. The sum of \$8,000 is hereby appropriated from the State treasury to the said "The Trustees of the State College for Colored Students," to be used primarily for the purchase of land and for the erection, preservation, repair, and equipment of any building or buildings which said trustees shall hereafter acquire for the purposes of said college, and if the whole of said sum should not be required for the purchase of land and for the erection, preservation, or repair of buildings, the remainder of said sum shall be used for the maintenance and support of said institution. Said sum shall be paid by the State treasurer to the treasurer of said trustees, upon his giving bond and security as hereinafter provided after notice received under the hand of the president and secretary of the said trustees that said body is fully organized and prepared to carry out the purposes of this act.

SEC. 8. The State treasurer is hereby directed and required to pay annually to the treasurer of the said "Trustees of the State College for Colored Students" 20 per cent or one-fifth part of the sum of money which he, the said State treasurer, has already received and hereafter shall receive annually by virtue of an act of Congress approved August 30, 1890, entitled [etc.].

SEC. 9. The moneys received by said trustees as provided in the foregoing section shall be used by said trustees for the support and maintenance of said college,

and the treasurer of said trustees, before receiving any money from said State treasurer, shall give bond with good and sufficient security to the State of Delaware in the sum of \$10,000, conditioned for the faithful application of all the moneys received. Said bond shall be approved by said trustees and shall be deposited in the office of the secretary of state. (May 15, 1891.)

Chapter 438, volume 17, Laws of Delaware:

SECTION 1. The person occupying the chair of chemistry in Delaware College, at Newark, Del., is hereby declared ex-officio State chemist.

SEC. 2. It shall be the duty of the State chemist annually to analyze samples of all fertilizers which may be offered for sale within this State, and for this purpose he is authorized and directed to take from not less than five original packages of said fertilizers which may be in the possession of any manufacturer, dealer, or persons using the same, two samples not exceeding one pound in weight, one sample to be retained by the State chemist, and the other sample to be sent by the State chemist, in a sealed bottle or can, to the secretary of state, who shall keep the same; and in case any manufacturer should request another analysis, then the sample retained by the secretary of state, at the request of any manufacturer, shall be sent to any chemist which the secretary of state, State chemist, and manufacturer shall agree upon.

SEC. 3. Every bag, barrel, or other package of commercial fertilizer manufactured or sold in this State shall have plainly stamped thereon the number of net pounds of fertilizer in the package, the name, brand, or trade-mark under which the fertilizer is sold, the name and address of the manufacturer, the place of manufacture, and the chemical analysis, stating the percentage of ammonia, of potash soluble in water, of available phosphoric acid, and of insoluble phosphoric acid; and any manufacturer or dealer who shall misrepresent the proportion of ammonia, phosphoric acid and potash, or either of them, contained in such fertilizer, shall be guilty of a misdemeanor, and upon conviction thereof on indictment shall be fined \$200 for the first offense and \$300 for each subsequent offense.

SEC. 13. In case the State chemist willfully makes any false or untrue analysis he shall be deemed guilty of a common nuisance, and upon conviction thereof shall be fined a sum not exceeding \$100, and shall stand committed to the custody of the sheriff until said fine is paid. (April 16, 1885.)

Chapter 240, volume 21, Laws of Delaware: Whereas the great advance in medical science has reached a point of exactitude heretofore unknown, more especially as to the cause and prevention of disease, and has attained the ability of demonstrating to a certainty the bacteriological origin of many of our most prevalent and fatal diseases; and whereas by microscopic and biological investigation the presence of these diseases can be made manifest when symptomatology fails, thus enabling the boards of health to make timely provision against the spread of the disease, and by so doing save the health and life of many citizens; and whereas these investigations can only be safely made in a laboratory fully and properly equipped for the purpose, and managed by skilled manipulators of special knowledge and experience in the sciences of pathology and bacteriology; and whereas Delaware College possesses excellent facilities in the way of suitable rooms and adequate equipment of libraries and apparatus, and besides offers at no cost the supervision of a trained bacteriologist as a guaranty of the character of the work; and whereas a similar line of work as regards domestic animals is carried on at the college under the provisions of the Hatch bill, none of which provisions could be used for the purposes contemplated in this act: Therefore,

SECTION 1. In addition to the duties and powers with which the board of health of the State of Delaware is now invested by the constitution and laws of this State, it is hereby empowered to establish and supervise a pathological and bacteriological laboratory at Delaware College, and to supplement the equipment already there with any additional appliances necessary to make it perfectly safe and reliable for the thorough use of any or all of these means of protecting the citizens of the State against the spread of disease.

SEC. 2. The said laboratory shall, by and with the advice and consent of the board of trustees of Delaware College, be located in buildings now belonging to said college, and said board of trustees shall furnish such accommodation of rooms, apparatus, and skilled supervision as may be required for said laboratory.

SEC. 3. The pathologists and bacteriologists, elected as hereinafter provided, shall conduct the routine work of said laboratory under the direction and supervision of the bacteriologist of Delaware College, and shall make all examinations and analyses, etc., that may be necessary, under the direction of the board of health of the State, for all the purposes that may be required to fully execute the intents of this act: *Provided, however,* That this shall not be so construed as to

interrupt or limit the power in the full control and management of the laboratory of the State board of health.

SEC. 4. All physicians, dentists, veterinary surgeons, or others practicing medicine or surgery or any branch thereof under the laws of this State shall be required to give prompt notice to the local or State board of health of any and all cases of contagious or infectious disease that may come under their professional notice, and shall have free access to the work of the laboratory for the determination of the diagnosis of any doubtful or suspicious case by forwarding (prepaid) a sufficient sample of urine, blood, sputum, or other substance of such case to the said pathologist and bacteriologist at Newark for examination, who shall examine the substance so sent and report to the physician, dentist, or others aforesaid sending the same the results of said examination without any unnecessary delay and without further charge; the said physician, dentist, or others aforesaid shall report the result immediately as herein above required: *Provided, however*, That nothing in the act shall be so construed as to prevent the board of health of the State from making full provision for the free use of the laboratory for the examination of any matter or substance so as to determine the diagnosis of diseases neither contagious nor infectious, and either local or constitutional, and for the examination of water or food supply for any citizen of the State.

SEC. 5. The regular annual meeting of the board of health of the State shall be held at Newark, \* \* \* at which meeting the pathologist and bacteriologist shall be elected annually by the action of the said board of health.

SEC. 6. The sum of \$3,500 annually shall be appropriated for the salary of the bacteriologist and all other expenses of the said laboratory, and the same is hereby appropriated out of any funds in the hands of the State treasurer not otherwise appropriated, and the annual expenses of the same thereafter. The said appropriations hereby made to be drawn by orders on the State treasurer, signed by the president and secretary of the State board of health, the accounts to be audited by the auditor of accounts of the State annually, as now required for the other accounts of the State board of health.

SEC. 7. This act shall be deemed and taken to be a public act, and shall go into effect immediately on its passage.

SEC. 8. It is hereby made the duty of the said pathologist and bacteriologist, whenever requested by the attorney-general, to make any and all examinations of any person or persons, or any organ or organs, or any part or parts of any person or persons, with the view of determining the cause or causes of death, and make a prompt report, without charge to the State or any county thereof.

(March 23, 1899, as amended by chapter 135, volume 22, laws of Delaware, February 25, 1901.)

Chapter 213, volume 21, Laws of Delaware:

SECTION 1. The State chemist is hereby required, when any person or persons purchasing any fertilizer sold in this State and composed of one or several ingredients from any manufacturer or vendors for their own use, and who themselves, the purchasers, are citizens of this State, submit to said State chemist fair samples of any such fertilizer for analysis in the manner prescribed in section 6, chapter 438, volume 17, Laws of Delaware, to make any and all such analyses for the sum of \$1, to be paid by said purchaser.

SEC. 2. The provision that said State chemist shall receive the sum of \$1 only when he makes analyses mentioned in section 1 of this act shall not be construed to mean that said State chemist is to be paid \$1 for each ingredient in any fertilizer mentioned in section 1 of this act and so analyzed by him.

## FLORIDA.

[The following matter is taken from the "Revised Statutes of Florida, prepared by W. A. Blount, C. M. Cooper, L. C. Massey, commissioners," Jacksonville, 1892.]

SEC. 278. The Florida Agricultural College is established.

SEC. 279. The design of this institution is to teach such branches of learning as are related to agriculture and mechanic arts, without excluding other scientific and classical studies, and including military tactics, in order to promote the liberal and practical education of the industrial classes in the several pursuits and professions of life.

SEC. 280. [Amended by section 4233.] The superintendent of public instruction, commissioner of agriculture, and the State treasurer by virtue of their said offices, and the other persons who are now members and trustees of this corporation, and their successors, are a body corporate and politic, by the name of the Florida

Agricultural College, with the general powers of a corporation for said purposes, including the right of perpetual succession and to have a corporate seal.

[In *State v. Knowles et al.* (holding themselves to be a body corporate), the court said (16 Fla., p. 616): "The next general proposition as to this statute is that it impairs the obligation of contract. The statute changes the trustees of this college. It substitutes the trustees named in the act of 1877 for those named in the act of 1872, as the act of 1872 substituted those named in it for those mentioned in the act of 1870. The ground upon which this view is based is that this is a private not a public corporation. The corporation is itself founded by the State through property derived from the Government of the United States. These trustees are made by this legislation the agents of the State to collect and disburse property appropriated by the General Government to the State for a public purpose. There is not and never was any private property in the funds. They were derived from the government. The founder of this institution was the government of the State of Florida and the property which constituted its basis was public moneys of the State of Florida derived by it from the Government of the United States in trust for the establishment of an institution of this character. It never was the purpose of the State of Florida to give these trustees any private right to this property. Throughout the whole legislation they are shown to be simply public agents to manage a public property. The only right they have to it is by the legislation of the State, and every section of these acts shows that it was founded by public funds, and for a public purpose. (4 Wheaton, 5 Stewart & Porter.)" It may be true that any legislation of the State appropriating these funds to any other purpose than that purpose named in the act of Congress might have been in bad faith, but that is a matter which does not concern these trustees, nor does this fact change the nature of the institution. It is insisted that the obligation of a contract with W. H. Gleason [whose offer of 2,000 acres of land had been accepted] is impaired by the act of 1877, in that it directs a removal of the college. This question is entirely independent of the question raised in this case, which is the right of the trustees to hold and exercise a public trust against the provisions of a statute naming other persons trustees in their stead. Because they have made a contract with some one else can not extend their powers or rights. The question whether a city or town has made a contract with A, B, or C is entirely distinct from the question whether the legislature may not change the affairs of a public municipal corporation. What has been said disposes of the further objection on the ground that these respondents are deprived of their property without due process of law. Holding their franchises subject to legislative action, legislation depriving them of them is due process of law."]

SEC. 281. [Amended by section 4233, section 2, post.] The superintendent of public instruction and the said State treasurer shall by virtue of their offices as such be president and treasurer of said board of trustees of said college, and the said board shall elect a vice-president, secretary, and executive committee, which committee shall consist of five members. Said executive committee is empowered to act in behalf and under directions of the board between the regular meetings of the same, and determine all the matters relating to officers or committees and make all needful rules and regulations for the management of the affairs of the board.

SEC. 282. The treasurer herein appointed shall receive and, if necessary, demand and sue for in his own name as treasurer all property and debts belonging to said board.

SEC. 283. The said corporation shall have power to build and construct a college building and such other buildings and outbuildings as they may deem necessary, to contract and be contracted with, to sue and be sued, plead and be impleaded in all courts of law and equity, to receive donations and make purchases of lands, and to sell and convey the same.

SEC. 284. [Repealed. See section 3 of section 4233, post.] Said trustees shall have power to remove any member from said corporation when, by continued neglect, he fails to perform his duties, or when by reason of age or infirmity he shall have become permanently incapable of performing them. They shall also fill by election any vacancy that may occur in their board, subject to the approval of the judges of the supreme court.

SEC. 285. The trustees shall receive no compensation for their services while attending any of the meetings of the board, but may be allowed their necessary expenses while going to, from, and attending such meetings.

SEC. 286. Said trustees are hereby authorized to claim and receive from the Secretary of the Interior the agricultural college land scrip to which this State is entitled by act of Congress July 2, 1862, and acts supplemental thereto. Said scrip is hereby transferred and assigned to and vested in the trustees of the Florida Agricultural College and their successors and assigns forever. They shall, when in their judgment it will best promote the object for which they are chosen, sell and assign the scrip, or locate and thereafter transfer and convey the lands, and use the proceeds as herein directed.

SEC. 287. Ten per cent of the proceeds of the sales of the scrip or of the lands may be expended for the purchase of a site for an experimental farm. The remainder of the proceeds shall be invested in the stocks of the United States or

<sup>a</sup>The first of these, of course, refers to the Dartmouth College cases, the second to the Alabama case (1833), *Trustees of University v. Winston*. "The trustees of the University of Alabama compose a public corporation entirely within the control of the legislature, and the latter has authority, by the passage of any statute or statutes, to alter, amend, vary, or enlarge the original acts of incorporation."

of some of the States of this Union, bearing an annual interest of not less than 6 per cent on their par value, and shall remain a permanent fund forever. The annual interest of the fund shall be regularly applied, without diminution, to the purposes set forth in section 279. Donations may be received for specific purposes, and shall be applied to the objects for which they were granted.

SEC. 288. No portion of the principal or interest of the fund shall be applied, directly or indirectly, under any pretense whatever, to the purchase, erection, preservation, or repairs of any building or buildings, or for expenses incurred in selling the scrip, locating the lands, or in managing the funds of the lands. No scrip, lands, or property of whatever kind that may be obtained and held by said corporation under this chapter, whether of buildings, grounds, farms, workshops, fixtures, machinery, apparatus, cabinets, library, furniture, or other valuables, shall be encumbered, aliened, or otherwise disposed of by the said trustees, or by any other person or persons, contrary to the provisions of this chapter, except on such terms as the legislature shall have previously approved, and any act of said trustees or any other person or persons which shall have or be intended to have such effect shall be void.

SEC. 289. The college shall remain at its present location unless the same be changed by statute.

SEC. 290. The indebtedness of the State to the agricultural-college fund and the evidences of such indebtedness remain as heretofore provided by law.

SEC. 291. The board of trustees shall choose a president of the college and such professors, teachers, superintendents, and employees as the necessity of the institution may demand. They shall fix their compensation, define their duties, limit their powers and the duration of their terms of office; also make all general provisions for the management of the college in its several departments. They may limit the number of students and confer appropriate degrees.

SEC. 292. The president, professors, and superintendents of said college, and the secretary of the board of trustees, shall constitute the faculty of the college.

SEC. 293. The faculty shall have the immediate charge and management of the college and farm; shall determine the basis of admission, the length of complete and partial courses of study, the studies to be pursued, and the text-books to be used; also the daily hours for labor and of attendance upon the exercises of the institution. They shall likewise make all needful rules and regulations for the government and discipline of the students, and for promoting in the highest degree their morals, health, decorum, and scholastic advancement; all of which shall be subject to revision, alteration, or rejection by the board of trustees.

SEC. 294. The several departments of the college shall be open to applicants for admission at the lowest rate of expense consistent with the welfare and efficiency thereof, as herein provided, and without further distinction as to class or locality, to wit: Each county shall be entitled to send annually, or so often as vacancies may occur, one student for each member of the assembly from that county; such students shall be selected by the boards of public instruction of the several counties from among the most advanced pupils in the common and higher schools therein who may present themselves as candidates. Each county board of public instruction shall annually, or as often as vacancies occur which should be filled by the county, give early notice of such vacancy, and of the time and place of meeting for the examination of the candidates. The county board shall then and there, by themselves, or with the assistance of such persons as they may appoint, examine such candidates and select those best qualified as to scholastic attainments, good health, and upright moral character, and furnish them with certificates of selection for admission, subject to the reexamination and approval of the faculty of the college. In case any board of instruction fails to attend to the above duty, then pupils holding high rank in their schools in that county may make application in person to the faculty of the college and be examined and admitted on the same terms as they would have been had they passed a preliminary examination before the board of instruction of their county. But in case such vacancies remain unfilled students may be selected from the State at large by the faculty.

SEC. 295. Each senator during his term of office shall be empowered to nominate one student, who shall be a resident of his senatorial district, to said State Agricultural College, who shall be entitled to receive the benefit of a full course of instruction at said college without any charge for tuition, subject to such rules and regulations as may be established for the government and direction of said college.

SEC. 296. The comptroller is authorized to make examinations from time to time, as he may see fit, into the actions and doings of said trustees, to the end that he may ascertain whether the funds committed to them are and have been

managed according to the letter and intent of this chapter. Said trustees shall report to the comptroller annually on the 1st day of October, in such form as the comptroller may direct, the amount of land or land scrip sold, the price and terms of sale, the amount of money received therefor, the disposition made thereof, and the expense incurred in the sale.

SEC. 297. The trustees shall make an annual report to the superintendent of public instruction on or before the 1st day of October, to be by him printed with his report and laid before the legislature at the beginning of each regular session. Such report shall give a full exposition of the financial condition of the corporation, the progress and improvements made, the nature, cost, and results of experiments, and such other matters, including State industrial and economical statistics, as may be supposed useful; one copy of which the superintendent shall transmit by mail to each of the other colleges which were endowed under the provisions of the act of Congress of July 2, 1862; also a copy to the Secretary of the Interior, and one to each House of Congress.

SEC. 298. The legislature may add other departments of learning to this college when the endowment of such departments shall have been provided for.

SEC. 299. The justices of the supreme court shall constitute an examining committee, with power to investigate the affairs of the college and the corporation, and to appoint proxies to act in their stead.

SEC. 300. The legislative assent of the State of Florida is hereby given to the act of Congress entitled "An act to establish agricultural experiment stations in connection with the colleges established in the several States under the provisions of an act approved July 2, 1862, and of the acts supplementary thereto," and to the grants of money authorized by said act, and to the purpose of said grant.

SEC. 4233 (Acts and Resolutions, 1893). SECTION 1. Section 280 of the revised statutes of the State of Florida is hereby amended so as to read as follows: "Sec. 280. The Florida Agricultural College shall be under the direction of a board of seven trustees, who shall be appointed by the governor by and with the consent of the senate, not more than two of whom shall be residents of the town or county in which the college is located, and who shall hold their office for four years."

SEC. 2. Section 281 of the revised statutes of the State of Florida is hereby amended so as to read as follows: "Sec. 281. The members of said board of trustees shall annually elect from their number a president and a secretary. The State treasurer shall, by virtue of his office, be the treasurer of said board; and said board shall elect a vice-president and executive committee, which committee shall consist of three members. Said executive committee is empowered to act in behalf and under the direction of the board between the regular meetings of the board, and determine all the matters relating to officers or committees, and make all needful rules and regulations for the management of the affairs of the board of trustees."

SEC. 3. Section 284 of the revised statutes is hereby repealed.

SEC. 4234 (Ibid.). SECTION 1. There shall be established at some suitable point in Florida possessing climate conditions for growing all kinds of plant life, including cinchons, logwood, and camphor, olive and india rubber trees, also vanilla, tea, coffee, jute, New Zealand flax, etc., on muck lands over which the trustees of the Internal Improvement Fund have exclusive control under the act of Congress of September 28, 1850, an experimental station, to be operated by or under the supervision of the commissioner of agriculture, and under such rules, regulations, and conditions as may be prescribed by the trustees of the Internal Improvement Fund of the State of Florida.

SEC. 2. For the purpose of carrying out the provisions of section 1 of this act and to create a fund for the establishment and maintenance of said agricultural station, and for the further drainage and reclamation of the lands set apart for that purpose, the trustees of the Internal Improvement Fund of the State of Florida are hereby authorized and directed to set apart 100,000 acres of the land granted the State of Florida by the act of Congress of September 28, 1850, to be sold at such prices as may be fixed by the trustees and the proceeds thereof to be expended by the said trustees of the Internal Improvement Fund in carrying out the provisions of section 1 of this act.

SEC. 269. A normal school<sup>a</sup> for colored teachers is established at Tallahassee, Leon County, similar in all respects as prescribed for the establishment of the normal school for white teachers, and subject to the direction and control of the State board of education.

<sup>a</sup>The funds granted to the State of Florida under an act of Congress approved August 30, 1890, are divided equally between this institution and the Florida Agricultural College.

## GEORGIA.

Constitution (1877), section 6, paragraph 1: The trustees of the University of Georgia may accept bequests, donations, and grants of land or other property for the use of said university. In addition to the payment of the annual interest on the debt due by the State to the university, the general assembly may, from time to time, make such donations thereto as the condition of the treasury will authorize. And the general assembly may also, from time to time, make such appropriation of money as the condition of the treasury will authorize, to any college or university (not exceeding one in number) now established or hereafter to be established in this State for the education of persons of color.

[The following matter is taken from "The code of Georgia, prepared by John L. Hopkins, Clifford Anderson, and Joseph R. Lamar," Atlanta, Ga., 1896.]

SEC. 1271. The government of the University of Georgia, at Athens, is vested in a board of trustees, who are subject to the general assembly.

SEC. 1272. For such purpose they are a body corporate and politic, by the name of the "trustees of the University of Georgia," by which they shall have a perpetual succession, have and use a common seal, and be a person in law able to plead and be impleaded, to hold and acquire real and personal estate, with power to lease and otherwise manage the same for the good of the university. All money or property granted by the State, or individuals, for the advancement of learning in general is vested in such trustees.

SEC. 1273. The board of trustees of the University of Georgia shall be composed of one member from each Congressional district, four from the State at large, two from the city of Athens, and the chairman ex officio of the local board of trustees of the Technological School, all of whom, except the latter, shall be appointed by the governor and confirmed by the senate, under the rules governing the appointment and confirmation of other officers of this State required by law to be confirmed by the senate.

SEC. 1274. The term of office of said trustees shall be eight years and until their successors are appointed, confirmed, and qualified. The first appointments shall be made by the governor before the 1st day of September, 1889, and confirmed by the senate. Four of them shall be appointed for two years, four for four years, and four for six years, and four for eight years, and as the terms of these appointees expire their successors shall be appointed and confirmed biennially thereafter for a full term of eight years. There shall be two trustees from the city of Athens, exclusive of one from the Congressional district in which said city may be located.

SEC. 1275. Persons to be eligible to the office of trustee shall be citizens of this State; shall be residents of the districts from which they are appointed; shall be at least 25 years of age, and shall not be a trustee of any other male college or university, excluding branch colleges of the university and high schools or academies, and shall be chosen with special reference to their fitness and capacity to exercise the duties of trustee. The governor shall be ex officio a member of the board of trustees and shall attend its meetings when possible, and is entitled to all the privileges of a member of the board.

SEC. 1276. In case of the death or resignation of any member of the board, the governor shall fill such unexpired term in the manner above provided, such appointment to be confirmed by the senate at the session after the same is made.

SEC. 1277. The board of trustees shall elect one of their number as their presiding officer, who shall be called the chairman of the board of trustees. The board may meet subject to their own order, but they must assemble in annual session in the city of Athens on the Thursday preceding the Sunday of the commencements of the university. They may establish such rules and regulations for their own direction as they deem proper; may fix the terms of the office of their chairman and secretary; and are vested with all the powers, privileges, and rights vested in the former board of trustees, and are charged with all the duties, obligations, and responsibilities incumbent on the same.

SEC. 1278. It shall be the duty of the members of the board of trustees of said institution to attend the meetings of the board, so as to take part in its deliberations; and whenever any trustee shall be engaged, at the time prescribed for the annual meeting of the trustees, as counsel or party in any case pending in the courts of this State, and such case shall be called for trial during the regular sessions of said board, his absence to attend such session shall be good ground for postponement or continuance of the case till the session of the board shall have come to an end.

SEC. 1279. The office of any member of the board of trustees shall be vacated if he neglects to furnish good and satisfactory excuse, in writing, to the board for

absence from two consecutive meetings thereof; and if any member for any cause fails to attend three successive meetings of the board, his office shall be declared vacant by the board, and the secretary shall in either event notify the governor of a vacancy in the board, and the governor shall fill the same as above provided for.

SEC. 1280. The members of the board shall each receive (for the payment of expenses actually incurred by them) the sum of \$4 for each day of actual attendance at the meetings and mileage in actual fare to and from the place of meeting by the nearest practicable route from their respective homes, said expenses and mileage to be paid by the State treasurer out of the funds of the State by executive warrant, on presentation of vouchers of the members approved by the chairman and signed by the secretary of the board. The members of said board shall receive no emolument or compensation for their services as such members.

SEC. 1281. The board of trustees shall submit to the general assembly, through the governor, biennial reports of their transactions, together with such information as is necessary to show the condition of the university, with such suggestions as it may think conducive to the good of the university and the cause of education in the State.

SEC. 1282. In prescribing the course of study to be followed in said university it shall be the duty of the trustees, in so far as the same can be done without detriment to other departments, to encourage and promote by the disposition of the time and attention of the students the regular course of bachelor of arts, in order that said course shall not be subordinated to any other course in the institution.

SEC. 1283. The board of trustees shall, in their discretion, ordain and establish such rules and measures as will, in their judgment, tend to secure the efficiency and promote the success of the two literary debating societies in said institution, and to the encouragement of oratory and composition among the students attending the exercises in these societies.

SEC. 1284. The trustees have power: 1. To elect their own officers, such as chairman, vice-chairman, secretary, treasurer, or such of them as they may require, and also all other officers they may deem necessary for their organization. 2. To elect a presiding officer of said university, who shall be styled the "chancellor of the University of Georgia," and in case of a vacancy in his office, unsupplied, to create such office and make such arrangement for the conduct of the institution as to them shall seem fit. 3. To elect or appoint professors, tutors, stewards, or any other officer necessary; to discontinue or remove them as the good of the university may require, and fix their salaries. 4. To prescribe the course of studies to be pursued by the students, the terms and manner of graduating, and of conferring all the degrees. 5. To establish all such schools of learning or art as may be useful to the State, and to organize the same in the way most likely to attain the ends desired. 6. To call on all persons who may have, or have had, any funds, property, papers, or books belonging to the university, to deliver them up and make settlements. 7. To adjust and determine the expenses of the institution. 8. To exercise any power usually granted to such incorporations necessary to its usefulness, and not in conflict with the constitution and laws.

SEC. 1285. The chairman of the board and two of its members may appoint a meeting at any time by giving to the others at least ten days' notice, by letter or otherwise. When the chairman does not act the senior trustee present shall preside, and in all other respects discharge his duties; when the board is divided the presiding officer shall give the casting vote, or may vote to make a tie. A majority of the body present shall govern, if a quorum. Nothing done at a special meeting shall be binding after the rising of the next annual meeting, unless then confirmed.

SEC. 1286. Such trustees shall never dispose of the stock by them subscribed for, except with the consent of the general assembly, but the dividends therefrom may be drawn and used as the various demands of the university may require.

SEC. 1287. The governor shall annually appoint five experienced educators, citizens of the State, as a special board of visitors to attend the examinations at the University of Georgia, preceding the annual commencement, to examine personally into the condition and management of said institution. Said visitors, or a majority of them, shall submit their report in writing as soon thereafter as possible to the governor, in which they shall report upon the character of the examinations aforesaid, the condition and management of said institution, together with such suggestions and recommendations thereon as they may deem proper. Said reports shall be laid before the general assembly by the governor.

SEC. 1288. A majority of said board shall constitute a quorum. Such visitors shall receive, as compensation for their services, \$4 per diem, estimating from the

date of leaving their homes, and mileage each way by the nearest practicable route to Athens at the rate of 3 cents per mile. The whole service of said board shall not exceed ten days.

SEC. 1289. The board of visitors for the University of Georgia shall complete the report required of them and lay the same before the trustees of said institution on or before the Saturday preceding the annual commencement day of said institution. The said board of visitors shall also, at the same time, present to the trustees, in writing, any matter of importance coming to their knowledge during their examination of the institution which, in their opinion, is material to the welfare, good management, and success of the same, making such suggestions touching the matter as may seem to the said board of visitors meet and proper: *Provided, however,* That the making of the report herein provided for shall not take the place of the report now required to be made to the governor under existing laws.

SEC. 1290. The board of trustees of the University of Georgia shall give to said report and the matter accompanying the same due and careful consideration, and in their discretion take final action on such matters as may be therein embraced looking to the welfare, government, discipline, and success of said institution.

SEC. 1291. The governor shall lay the reports, respectively, of the board of trustees and the board of visitors, annually, before the general assembly, in connection with his annual message, with such comments as he may see proper, and when so done the general assembly has power to revise and approve or reject the action of the board of trustees.

SEC. 1292. No person of any religious denomination shall be excluded from equal advantages of education and the immunities of the university on account of their speculative sentiments on religion, or for being of a different religious profession from the trustees or faculty.

SEC. 1293. The chancellor of the university, its professors and tutors, shall not be required to take certain oaths prescribed in its charter.

SEC. 1294. The chancellor has the authority to appear before the general assembly once at each session and address them in person on the condition, interests, and wants of the university.

SEC. 1295. The university may confer degrees as follows: (1) To each graduate of the university the degree of bachelor of arts; (2) to each graduate of the university, or of another college, of three years' standing, or to such graduates as have passed a year in the university schools (all being of good moral character), the degree of master of arts; (3) to all law students who have attended the lectures of the professors, and are recommended by them for the same, the degree of bachelor of laws; (4) to the graduates of such medical school as may be established by the trustees of the university, the degree of doctor of medicine; (5) to students in the university schools of two years' standing and proficient in two or more of them, the degree of doctor of philosophy; (6) to persons distinguished for learning, ability, and character, according to their respective vocations, the degree of doctor of laws, or of divinity, and, where appropriate, both. It may also confer such other degrees and honors as may tend to the promotion of the arts and sciences.

SEC. 1296. By the authority of the board of trustees there shall be established, in connection with the university, an institute combining the instruction usually given in academies and to the lower classes in colleges, and by the same authority there may be a reduction of the number of years usually spent in colleges prior to graduation. University schools for professional education, including the application of science to the industrial arts as well as to the more abstruse and recondite sciences, and especially for the promotion of medical and legal education, not omitting the application of chemistry to agriculture and mathematics to civil engineering.

SEC. 1297. There is reserved and set apart for the university campus, not subject to alienation, 37 acres of the tract of land donated to the university by the late Governor John Milledge.

SEC. 1298. The permanent income of said university from its bank stock shall not be less than \$8,000 annually, and when the dividends from the bank shall not be equal to said sum, the governor is required to make up the deficiency semi-annually by his warrant on the State treasurer for its payment out of any money not otherwise appropriated.

[For the character of the funds see act 95 of 1898, *post.*]

SEC. 1299. The various acts of the general assembly relative to said university in force at the time of the adoption of this code, if not embraced herein and not inconsistent with what is so embraced, are still of force.

[In the case of *Dart et al. v. Houston*, 22 Ga. (1857), the supreme court remarked in deciding a controversy as to the legal status of the corporation known as the Glynn County Academy: "It is necessary in the outset to consider whether the 'Trustees of the Glynn County Academy' be a corporation of the class which constitutes a contract between the State government and the corporators within the meaning of that clause of the Federal Constitution which inhibits a State from passing a law impairing the obligation of contracts. \* \* \* Chief Justice Marshall, in delivering the opinion of the court in *Dartmouth College v. Woodward*, remarked that 'if the act of incorporation be the grant of political power, if it create a civil institution to be employed in the administration of the government, or if the funds of the college be public property, or if the State of New Hampshire, as a government, be alone interested in the transactions, the subject is one in which the legislature of the State may act, according to its own judgment, unrestrained by any limitation of its power imposed by the Constitution of the United States.' \* \* \* We will now trace the history of the Glynn County Academy. The fifty-fourth clause of the constitution of February, 1777, declares that 'schools shall be erected in each county, and supported at the general expense of the State, as the legislature shall hereafter point out.' The fourteenth section of the act for the more full and complete establishment of a public seat of learning in this State declares that all public schools instituted or to be supported by funds or public moneys in this State shall be considered as parts or members of the university, and shall be under the foregoing rules and regulations (being those prescribed for the university). Those rules and regulations show that the action of the board of visitors and the board of trustees was to be submitted to the supervision of the general assembly. \* \* \* Commissioners were appointed for the town of Brunswick (1788) who were authorized to survey the town, and to sell all or any of the vacant lots in said town, except such as were reserved for public use, and the moneys arising from the sale were to be applied to the building and support of an academy in said town, and to no other purpose whatever. \* \* \* In 1813 the legislature enacted that the commissioners of the town and commons of Brunswick should be commissioners of the academy, and appointed commissioners in 1814 and authorized them to sue and subjected them to suit. \* \* \* In 1829 the inferior court of Glynn County was authorized and empowered to sell the academy building in said county and to apply the proceeds of the sale to the education of poor children in said county and for other county purposes. \* \* \* In 1838 the Brunswick Academy was incorporated, and the act to authorize the trustees of the Glynn County Academy to establish free schools in said county was repealed. \* \* \* The university was established in 1785, and the act establishing it made all public schools instituted or to be supported by the State members of the university and subject to the same rules and regulations, which placed them under the control of the general assembly. \* \* \* The question is as to the legislative control claimed and exercised over the government of the academy. It was exercised and its act acquiesced in. \* \* \* If the academy had been founded on private donations and incorporated in consideration thereof, the case would have fallen within the decision of the *Dartmouth College* case; \* \* \* but the funds of the academy are public property, and the legislature was not, therefore, restricted by any limitation of State power in the Federal Constitution from passing the act of 1851, which we are asked to declare void."

In the *Georgia Military Institute v. Simpson*, contractor, in 1860, the court touched upon the same points, but in the way of arbiter. "The character of this institution," said the court, "is somewhat amphibious. It was originally a private corporation. It was purchased by the State in 1857, and it is difficult to determine now what is its true character. It is purely a public corporation, bought with the funds of the State, and under its exclusive management and control. It has two boards—a board of trustees and a board of visitors—and it is no easy matter to distinguish between the two. By the fourth section of the act of 1857 it is declared: 'There shall be a board of trustees, who shall exercise all the powers and faculties usually exercised by trustees of colleges.' Does this subject the State, through this corporation, to be sued? We think not. Special power was given to sue the Central Bank and the State Road. There is no such authority conferred as to this institution. \* \* \* In this suit the trustees only were served. \* \* \* [Now,] the contract out of which this action originated was made with the board of visitors. \* \* \* It is manifest, then, that the Georgia Military Institute, if suable at all, *which we very much doubt*, can not be made chargeable through the board of trustees. \* \* \* The appeal, therefore, must be to the public authorities and not to the courts."]

Acts and Resolutions, No. 95, 1898: SECTION 1. From and after the passage of this act, whenever the trustees of the university shall, through their duly authorized agent or officer, present at the State treasury for redemption any valid, matured bond of this State as the property of such university, it shall be the duty of the governor to issue such trustees, in lieu of said matured bond so presented for payment, an obligation in writing, in the nature of a bond, in amount equal to the principal of matured bond, and falling due fifty years from the date of such issue, the same to bear interest at the rate of  $3\frac{1}{2}$  per cent per annum, and not subject to be called in for redemption by the State before that time, nor to be negotiated or transferred by said trustees, said new bonds or obligations to be payable to the said trustees alone, and to be issued under the great seal of the State, and signed by the governor and countersigned by the secretary of state. The interest thereon to be paid semiannually on the 1st days of January and July of each year, the terms prescribed by this act for the issue of such obligations to be fully expressed in the body thereof, the amount of money necessary to pay the interest on such obligations being herein annually appropriated. (December 20, 1898.)

Ibid., No. 153: The board of trustees of the university of the State are hereby authorized to operate regular summer sessions of the University of Georgia in graduate courses and work closely related thereto, including psychology and the history and philosophy of education, for the special benefit of the white teachers of the State without regard to sex or age. (December 22, 1898.)

SEC. 1300. The Georgia Normal and Industrial College, at Milledgeville; State Normal School, at Rock College, Athens; State College of Agriculture and

Mechanic Arts, at Athens, with the Agricultural Experiment Station connected therewith, at Griffin; North Georgia Agricultural College at Dahlonega; Medical College of the University of Georgia, at Augusta; the Technological School, at Atlanta; Georgia State Industrial College for Colored Youth, at Savannah, are branches of the University of Georgia, and are governed in the manner prescribed in the respective acts incorporating the same.

SEC. 1301. All the branch colleges of the State University of Georgia, now or hereafter established, except the last mentioned in the preceding section, shall be open to all white female students of proper age and qualifications, with equal rights and privileges as those exercised and enjoyed by the male students of such institutions, under such rules and regulations as may be prescribed by the several boards of trustees of said institutions.

SEC. 1302. The board of directors of the Georgia Experiment Station shall have conducted throughout the State each year, during the season most convenient to the agriculturists, a series of farmers' institutes for the instruction of the citizens of this State in the better methods of agriculture in its various branches. These institutes shall be held at such time and places as said board may direct. The board shall make such rules and regulations as it may deem proper for organizing and conducting such institutes. In selecting lecturers for said institutes preference shall be given to practical successful farmers possessing aptitude for the work. The exercises of such institutes shall be so arranged as to present the results of the most recent investigations in practical agriculture.

SEC. 1303. It shall be the duty of said board to apply exclusively to the support of said institutes any moneys which may come into its possession under any act which the Federal Congress may hereafter pass in aid of farmers' institutes and any moneys which may be derived from any other source as a gift or donation in aid of farmers' institutes. Said board shall account to the governor for all such moneys quarterly, showing in detail amounts received, sources whence derived, and how expended. Reports as to moneys which may be received under any act of the Federal Congress as above indicated shall conform to Congressional requirements. Biennially said board shall, through the commissioner of agriculture, report to the governor in detail its acts and doings as to said institute. The biennial reports shall embrace all the facts contained in the quarterly reports herein required.

SEC. 1015. [Public Property, chapter 1—Public buildings.] The State has an interest in the university at Athens, the asylum for the blind at Macon, the buildings of the Technological School, and of the other branch colleges.

Joint resolution, November 26, 1890: The State of Georgia hereby accepts the donation from the United States of a part of the proceeds of the public lands to be paid and used as provided in an act of Congress of the United States, approved August 30, 1890, upon the terms and conditions prescribed therein.

General laws, 1890-91: SECTION 1. There shall be established in connection with the State university, and forming one of the departments thereof, a school for the education and training of colored students. Said school shall be located, equipped, and conducted as hereinafter provided.

SEC. 2. The governor shall appoint five fit and discreet persons, residents of this State, to be known as the "Commission on the school for colored students," who shall serve without pay, except that their actual expenses while away from their several places of residence, attending to the duties of such commission, may be allowed, as hereinafter provided; and they may select from their number a chairman and secretary, prescribe rules and regulation for their government, accept the resignation of any member, and fill all vacancies. A majority shall constitute a quorum for the transaction of business.

SEC. 3. It shall be the duty of said commission, as soon as practicable after the passage of this act, to procure the grounds and buildings necessary for the establishment of the school herein provided for. It shall be located within or near the corporate limits of that city or town in the State which shall offer the best inducements for such location, in the opinion of said commission. In making a selection of a location for said school the commission shall give preference to such place as shall be of easy access to all the colored people of the State, having due regard to the appropriateness, eligibility, and healthfulness of the surroundings, as well as to any offer or donation of value that may be made to secure the said school, and any inducements offered by any nonsectarian institute of this State. The selection once made shall be final.

SEC. 4. The said commission, as soon as they shall have selected the location and procured the necessary grounds, shall proceed to have erected on such grounds suitable buildings for such school, or, in case they secure grounds upon which there are buildings already erected, shall proceed to remodel the same,

erecting any additional buildings that may be necessary and practicable under the appropriations made therefor.

SEC. 5. A course of training shall be provided for all the students in said school, embracing the studies required by the acts of Congress of the United States, approved July 2, 1862, and August 30, 1890, making donations of public lands and the proceeds thereof to the States and Territories for educational purposes. No student shall be permitted to remain in the institution unless satisfactory progress shall be made by him, in the opinion of the faculty.

SEC. 6. The said school, when so established, shall be a part of the University of Georgia, and under control and management of its board of trustees. Said board shall have authority from time to time to add such special features to the course and to open such other departments of training and instruction therein as they shall deem that the progress and advancement of the times require. They shall also have authority to ordain and establish such rules and by-laws for the regulation of the school and the teaching, training, and governing of the students, not inconsistent with this act, as in their opinion may be proper to secure the success of said school.

SEC. 7. The officers of said school shall be a president, and such other professors, teachers, and instructors as may be necessary, in the opinion of the board of trustees, to carry on the school in accordance with the intention of this act. The chancellor of the University of Georgia shall have the general supervision of said school. The officers aforesaid shall be elected and their salaries fixed, either directly by the board of trustees or through the local board of trustees hereinafter provided for.

SEC. 8. When the necessary buildings shall have been procured, erected or completed as required by this act, and said school shall be ready for the reception of students, said commission shall notify the board of trustees of the University of Georgia, and shall turn the said school over to their control and management.

SEC. 9. There shall be one beneficiary for each representative in the general assembly from each county in this State, selected by the board of education in each county, under such rules and regulations to be prescribed by the local board of trustees herein provided for, and who shall be first entitled to the benefits of said school; the tuition shall be free to all students who are residents of the State of Georgia. The rate of tuition to others than residents of the State shall not exceed fifty dollars per annum.

SEC. 10. The five persons named in the second section of this act shall become, as soon as said school is turned over by them to the board of trustees of the University of Georgia, a local board of trustees for said school, with perpetual succession, as hereinbefore provided, and they shall always be charged with the immediate control, supervision, and management of said school, subject to the general board of trustees. The chairman of said local board of trustees shall be *ex officio* a member of the board of trustees of the University of Georgia.

SEC. 11. All property purchased under authority of this act shall be free from liens or incumbrances, and title to the same, as well as to any donation that said commission may receive, shall be taken in the name of the trustees of the University of Georgia, in their corporate capacity, and said property shall become the property of the State of Georgia, and the same shall not be alienated by any one, nor shall any valid lien be created thereon, neither in the erection of any building thereon, nor by the act of any person, nor by the operation of law.

SEC. 12. When one of said commission shall have incurred any necessary expense while away from his place of residence in the performance of his duty under this act, then, on verification of the same, by his affidavit, the governor may indorse the same as correct, and order it paid out of the funds herein appropriated. Any indebtedness for plans and specifications must likewise be indorsed by the governor before payment of the same is made.

SEC. 13. When said commission shall have performed their duties under this act and shall turn over said property to the trustees of the University of Georgia, as herein provided, said commission shall submit to said board a full and final statement describing the property purchased, the amount of money expended therefor, with proper vouchers, and said board of trustees, after verification of the same, shall transmit to the governor said report, with any suggestions there-with they may deem proper to make, and the governor shall transmit to the general assembly a summary of the same.

SEC. 14. The sum of eight thousand dollars is hereby annually appropriated to the board of trustees of the university to be drawn upon executive warrant in their favor for said purposes.

SEC. 15. The appropriation herein provided for shall be in lieu of any claim of the colored population of this State upon the proceeds of the agricultural land

scrip donated by the Congress of the United States by said act of Congress approved July 2, 1862.

SEC. 16. The board of visitors of the State university, or a committee of their body, shall exercise like functions and powers touching said institution as are prescribed by law for said board in relation to the State university.

SEC. 17. As to the additional donation of the proceeds of public lands made to this State by the United States under said act of Congress approved August 30, 1890, the general assembly proposes and reports to the Secretary of the Interior of the United States as a just and equitable division of the funds to be received under said act of August 30, 1890, between one college for white students and one institution for colored students, that one-third of said fund shall be for the colored students and two-thirds for the whites, provided, that this division may be at any time modified by the written consent of the Secretary of the Interior of the United States and the governor of Georgia for the time being, so as to make the same a just and equitable division of the fund arising under said act of Congress of August 30, 1890, between the white and colored people of the State for the purposes of said education.

SEC. 18. The act approved March 3, 1874, entitled "An act to equitably adjust the claims of the colored race for a portion of the proceeds of the agricultural land scrip," by which eight thousand dollars per annum was heretofore appropriated to the Atlanta University, is hereby repealed. And no colored student shall be admitted into the university and no white student shall be admitted into the school for colored students herein provided and established.

SEC. 19. All laws and parts of laws in conflict with the provisions of said act, including said act of March 3, 1874, are hereby repealed. (November 26, 1890.)

#### IDAHO.

Constitution (1889) Article X: SECTION 1. Educational, reformatory, and penal institutions, and those for the benefit of the insane, blind, deaf and dumb, and such other institutions as the public good may require, shall be established and supported by the State in such manner as may be prescribed by law.

SEC. 2. All property and institutions of the Territory shall, upon the adoption of the constitution, become the property and institutions of the State of Idaho.

[The following matter is taken from the general laws of the State of Idaho.]

General laws, 1888-89: SECTION 1. There is hereby established in this Territory, at the town of Moscow, in the county of Latah, an institution of learning by the name and style of "The University of Idaho."

SEC. 2. [See act passed at fifth session.] The government of the university shall vest in a board of regents to consist of nine members chosen from the Territory at large, which board the governor shall nominate and, by and with the advice and consent of the legislative council, appoint. The term of office of said regents shall be two years from the first Monday in February in the year in which appointed.

SEC. 3. The board of regents and their successors in office shall constitute a body corporate by the name of "The Regents of the University of Idaho," and shall possess all the powers necessary or convenient to accomplish the objects and perform the duties prescribed by law, and shall have the custody of the books, records, buildings, and other property of said university. The board shall elect a president, secretary, and treasurer who shall perform such duties as shall be prescribed by the by-laws of the board. The secretary shall keep a faithful record of all the transactions of the board and of the executive committee thereof. The treasurer shall perform all the duties of such office, subject to such regulations as the board may adopt, and for the faithful discharge of all his duties shall execute a bond in such sum as the board may direct.

SEC. 4. The time of the election of the president, secretary, and treasurer of said board, and the duration of their respective terms of office and the times for holding the regular annual meeting and such other meetings as may be required, and the manner of notifying the same, shall be determined by the by-laws of the board. A majority of the board shall constitute a quorum for the transaction of business, but a less number may adjourn from time to time.

SEC. 5. The board of regents shall enact laws for the government of the university in all its branches, elect a president and the requisite number of professors, instructors, officers, and employees, and fix the salaries and the term of office of each, and determine the moral and educational qualifications of applicants for

admission to the various courses of instruction; but no instruction either sectarian in religion or partisan in politics shall ever be allowed in any department of the university, and no sectarian or partisan test shall ever be allowed or exercised in the appointment of regents or in the election of professors, teachers, or other officers of the university, or in the admission of students thereto, or for any purpose whatever. The board of regents shall have power to remove the president or any professor, instructor, or officer of the university, when in their judgment the interests of the university require it. The board may prescribe rules and regulations for the management of the libraries, cabinet, museum, laboratories, and for the care and preservation thereof, with penalties and forfeitures, by way of damages for their violation, which may be sued for and collected in the name of the board, before any court having jurisdiction of such action.

SEC. 6. The board of regents are authorized to expend such portion of the income of the university fund hereinafter created as they may deem expedient for the erection of suitable buildings and the purchase of apparatus, a library, cabinets, and additions thereto.

SEC. 7. At the close of each fiscal year the regents, through their president, shall make a report in detail to the governor, exhibiting the progress, conditions, and wants of the university, the course of study, the number of professors and students, the amount of receipts and disbursements, together with the nature, costs, and results of all important investigations and experiments, and such other information as they may deem important.

SEC. 8. The president of the university shall be president of the faculty or of the several faculties as they may be hereafter established and the executive head of the instructional force in all its departments. As such, he shall have authority, subject to the board of regents, to give general direction to the instruction and scientific investigation of the university, and so long as the interests of the institution require it he shall be charged with the duties of one of the professorships. The immediate government of the university shall be intrusted to the faculty, but the regents shall have power to regulate the course of instruction and prescribe the books or works to be used in the several courses and also to confer such degrees and grant such diplomas as are usual in universities or as they shall deem appropriate, and to confer upon the faculty, by by-laws, the power to suspend or expel students for misconduct or other cause prescribed by such by-laws.

SEC. 9. The object of the University of Idaho shall be to provide the means of acquiring a thorough knowledge of the various branches of learning connected with scientific, industrial, and professional pursuits, and to this end it shall consist of the following colleges or departments, to wit: First, the college or department of arts; second, the college or department of letters; third, the professional or other colleges or departments as may from time to time be added thereto or connected therewith.

SEC. 10. The college or department of arts shall embrace courses of instruction in mathematical, physical, and natural sciences with their application to the industrial arts, such as agriculture, mechanics, engineering, mining, and metallurgy, manufactures, architecture, and commerce in such branches included in the college of letters as shall be necessary to a proper fitness of the pupils in the scientific and practical courses for their chosen pursuits, and, as soon as the income of the university will allow, in such order as the wants of the public shall seem to require, the said courses in the sciences and their application to the practical arts shall be expanded into distinct colleges of the university, each with its own faculty and appropriate title. The college of letters shall be coexistent with the college of arts and shall embrace a liberal course of instruction in language, literature, and philosophy, together with such courses or parts of courses in the college of arts as the regents of the university shall prescribe.

SEC. 11. The university shall be open to female as well as male students, under such regulations and restrictions as the board of regents may deem proper.

SEC. 12. No student who shall have been a resident of the Territory for one year, next preceding his admission, shall be required to pay any fees for tuition in the university, except in a professional department and for extra studies. The regents may prescribe rates of tuition for any pupil in a professional department, or who shall not have been a resident as aforesaid, and for teaching extra studies.

SEC. 13. The board of regents herein provided for shall be appointed immediately after this act becomes a law; and within ninety days after the appointment of said regents the board shall meet at Boise City and elect a president, secretary, and treasurer thereof, and shall at said meeting adopt by-laws for the government of said board and the officers chosen by virtue of this act.

SEC. 14. The sum of \$15,000 is hereby appropriated out of any money in the Territorial treasury of Idaho, not otherwise appropriated, and the Territorial

comptroller is hereby authorized to draw his warrant on the Territorial treasurer for said amount, and the Territorial treasurer is hereby directed and commanded to pay the same, as hereinafter provided, which money shall be expended for the following purposes, to wit: First, the purchase of a site or grounds for said university, said location to consist of not less than 10 nor more than 20 acres of ground, and for the improvement of the same, and for keeping the same in repair; second, to advertise for and obtain plans and specifications for a university building, under such rules and regulations as the board may impose; third, for the payment of the necessary expenses of said board, as hereinafter provided.

SEC. 15. The president and secretary ex officio, and one member of the board to be appointed by the president thereof, shall constitute an executive committee of said board, whose duties shall be prescribed by the by-laws of the board.

SEC. 16. Upon executing and filing with the Territorial treasurer a good and sufficient bond, in whatever sum the board of regents shall direct, provided said bond shall have been first approved by the Territorial attorney-general, the Territorial treasurer shall pay over to the treasurer of said board the sum of \$15,000, or so much thereof as may be available; and in the event said sum is not paid in full upon the execution and delivery of said bond as aforesaid, then the remainder of said sum shall be transferred to the treasurer of said board as speedily as the fund shall accumulate therefor.

SEC. 17. The treasurer of said board shall, out of any moneys in his hands belonging to said board, pay all orders drawn upon him by the president and secretary thereof, when accompanied by vouchers fully explaining the character of the expenditure, and the books and accounts of the treasurer shall at all times be open to the inspection of the board. The treasurer shall make an annual report to the president of the board of all transactions connected with the duties of his office.

SEC. 18. There shall be levied and collected annually a Territorial tax of one-half mill for each dollar of the assessed valuation of the taxable property of the Territory, which amount, when so levied and collected, shall be appropriated to a university-building fund to remain in the treasury subject to the order of the board of regents; but in no event shall said board appropriate the fund thus collected, or any portion thereof, to any purpose other than that for which said fund was provided: *And provided further*, That said tax shall not be levied and collected for a longer period than four years.

SEC. 19. The regents shall receive the actual amount of their expenses in traveling to and from and in attendance upon all meetings of the board, or incurred in the performance of any duty in pursuance of any direction of the board; accounts of such expenses shall be duly authenticated and audited by the board, and be paid on their order by the treasurer out of any fund belonging to the university not otherwise appropriated. No regent shall receive any pay, mileage, or per diem except as above prescribed. (January 30, 1889.)

General laws, first session (1890-91): SECTION 1. The assent of the legislature of the State of Idaho is hereby given to all the provisions of an act of Congress approved July 2, 1862, and also to an act approved March 2, 1887, entitled "An act to establish agricultural experiment stations in connection with the colleges established in the several States under the provisions of an act approved July 2, 1862, and the acts supplemental thereto," and the acts amendatory thereof and supplementary thereto. (January 23, 1891.)

General laws, first session (1890-91): SECTION 1. Section 18 of an act to establish the University of Idaho be amended to read as follows: SEC. 18. There shall be levied and collected annually a State tax of three-quarters of a mill for each dollar of the assessed valuation of taxable property of the State of Idaho, which amount, when so levied and collected, shall be appropriated to a university building fund, to remain in the treasury subject to the order of the board of regents; but in no event shall said board appropriate the fund thus collected, or any portion thereof, to any purpose other than that for which said fund was provided: *And provided further*, That said tax shall not be levied and collected for a longer period than four years from the date hereof. (February 12, 1891.)

General Laws, second session: SECTION 1. Section 1 of an act to establish the University of Idaho [evidently the act of February 2, 1891, is the one referred to, not section 18 of the act of January 30, 1889, referred to in the foregoing law of February 12, 1891] be amended to read as follows: There shall be levied and collected annually a State tax of three-quarters of a mill for each dollar of the assessed valuation of taxable property of the State of Idaho, which amount when so levied and collected shall be appropriated to a university building fund, to remain in the treasury subject to the order of the board of regents; but in no event shall said board appropriate the funds thus collected or any portion thereof

to any purpose other than that for which said fund was provided, and provided that said tax shall be levied and collected for the years 1893, 1894, and 1895; and that the said board of regents may anticipate the receipt of the said taxes by issuing warrants to the contractors for the erection of the buildings, bearing interest at not more than 6 per cent per annum, payable out of the first moneys received from said taxes, and said warrants shall be a charge upon said taxes only and not a charge against the State. (February 24, 1893.)

General Laws, fifth session: SECTION 1. Section 2 of an act to establish the University of Idaho is amended to read as follows: SEC. 2. The government of the university shall vest in a board of regents to consist of nine members chosen from the State at large, which board the governor shall nominate, and with the advice and consent of the Senate, appoint. The term of office of said regents shall be six years from the first Monday in February in the year in which appointed: *Provided*. That the regents appointed in the year 1899 shall hold their offices during the following periods: Three shall be appointed for a term of two years, three shall be appointed for a term of four years, and three shall be appointed for a term of six years. The governor shall have power to fill vacancies in the board by appointment, which appointment shall be valid until the last day of the regular session of the legislature following such appointment.

Ibid: SECTION 1. For the purpose of providing money for the finishing and furnishing the State University of Idaho, etc., a loan of \$49,000 is authorized.

SEC. 8. Fourteen thousand dollars shall be paid out for expenses incurred in finishing and furnishing the State University of Idaho. (March 9, 1899.)

General Laws, sixth session: SECTION 1. Section 2 of an act "To establish the University of Idaho," is amended to read as follows: SEC. 2. The government of the university shall vest in a board of regents, to consist of five members chosen from the State at large, which board the governor shall nominate, and with the advice and consent of the senate, appoint. The said board shall be nonpartisan, no more than three of whom shall be of the same political party. The terms of office of said regents shall be six years from the first Monday in February in the year in which appointed: *Provided*, That the regents appointed in the year 1901 shall hold their office during the following periods: One shall be appointed for a term of four years and two shall be appointed for a term of six years. The governor shall have power to fill vacancies in the board by appointment, which appointment shall be valid until the last day of the regular session of the legislature following such appointment. (March 4, 1901.)

Ibid: SECTION 1. For the purpose of providing money for the erection of a school of science hall, and for the erection of a girls' dormitory and the furnishing thereof at the University of the State of Idaho, a loan of \$50,000 is hereby authorized, to be negotiated by a board consisting of the governor, treasurer, secretary of state, and attorney-general of the State of Idaho, on the faith and credit of the State of Idaho, and secured by the proceeds, as herein provided, of the sales of school of science lands and timber on such lands, and of the interest on the moneys accruing from the sales of lands and timber belonging to the Agricultural College and the State University.

SEC. 5. For the purpose of securing the payment of the principal of the bonds Nos. 1 to 25, inclusive, provided for in this act, the proceeds of the sale of all the lands, or of the timber growing thereon, granted to the State of Idaho by the United States for the establishment and maintenance of a school of science, are hereby set apart as a separate and distinct fund, to be known as the school of science building fund; and after the payment of said principal of said bonds of this act, then the proceeds of the sales of said lands or timber shall be paid into the general fund in the State treasury until the amount, equal to the total amount of interest that has heretofore been paid out of the general fund on said bonds, issued under the provisions of this act, less the amount of interest that may have been paid into the said general fund from investment of school of science sinking fund money in State warrants as herein provided, has been so paid into the general fund. When the principal of said bonds shall have been fully paid, and the general fund of the State reimbursed for the interest on said bonds provided for in this act, then and thereafter the proceeds of the sales of said lands and timber shall be disposed of as may by law be provided.

SEC. 6. For the purpose of securing the payment of the principal of the bonds Nos. 26 to 50, inclusive, provided for in this act, the interest on the proceeds of the sale of all the lands, or of timber growing thereon, granted to the State of Idaho by the United States for the support and maintenance of an agricultural college and for the support and maintenance of a State university are hereby set apart as a distinct fund, to be known as the university dormitory building fund; and after the payment of said principal of said bonds of this act, then the inter-

est on the proceeds of the sales of said lands or timber shall be paid into the general fund in the State treasury until the amount, equal to the total amount of interest that has heretofore been paid out of said general fund on said bonds, issued under the provisions of this act, less the amount of interest that may have been paid into the said general fund from the investment of university dormitory building sinking fund money in State warrants as herein provided, has been so paid into the general fund. When the principal of said bonds shall have been fully paid and the general fund of the State reimbursed for interest on said bonds provided for in this act, then and thereafter the interest on the proceeds of the sale of said lands and timber shall be disposed of as may be provided by law. (March 14, 1901. The act has 9 sections; those omitted deal with the financing of the loan.)

## ILLINOIS.

Constitution (1870), Article VIII: SECTION 2. All lands, moneys, or other property donated, granted, or received for school, college, seminary, or university purposes, and the proceeds thereof, shall be faithfully applied to the objects for which such gifts or grants were made.

SEC. 3. Neither the general assembly nor any county, city, town, township, school district, or other public corporation, shall ever make any appropriation or pay from any public fund whatever anything in aid of any church or sectarian purpose or to help support or sustain any school, academy, seminary, college, university, or other literary or scientific institution controlled by any church or sectarian denomination whatever; nor shall any grant or donation of land, money, or other personal property ever be made by the State or any such public corporation to any church or for any sectarian purpose.

[The following matter is taken from "The Revised Statutes of the State of Illinois, 1801, compiled and edited by Harvey B. Hurd." Chicago, 1901.]

Chapter 144: SECTION 1. Any corporation which has been or may be incorporated under any general law of this State for the purpose of establishing or conducting a university, college, academy, or other institution of learning, in addition to the powers granted by such law, shall have power to take by purchase, gift, grant, devise, or bequest, and to hold for the use of such corporation, any real or personal property whatever, and to sell, convey, mortgage, or otherwise use the same as may be considered most conducive to the interests of such institution; but such corporation shall have no power to divert any gift, grant, devise, or bequest from the specific purpose designated by the donor.

SEC. 16. The Illinois Industrial University, located at Urbana, in Champaign County, shall, after the passage of this act, be known as the University of Illinois, and under that name and title shall have, possess, be seized of, and exercise all rights, privileges, franchises, and estates which have hitherto belonged to, or may hereafter inure to, the said Illinois Industrial University.

SEC. 17. There shall be elected at the general election, to be held in the several precincts and counties of this State on the Tuesday next after the first Monday of November, 1888, and every two years thereafter three trustees of the University of Illinois, and the trustees so elected, together with the governor, the president of the State board of agriculture, the superintendent of public instruction, and those persons who may have been appointed by the governor, to be trustees of said university, and whose terms of office shall not have expired, shall constitute the board of trustees of the University of Illinois, and shall succeed to and exercise all the powers conferred by the act "to provide for the organization and maintenance of the Illinois Industrial University," approved February 23, 1867, except as is herein or may be hereafter provided by law.

SEC. 18. The trustees, to be elected as provided in this act, shall be voted for on the same ballots with the State officers to be chosen at such recurring general elections, and the election of said trustees shall be conducted, and the canvass, statement, and returns of the votes cast for said trustees shall be made in the same manner and by the same officers, and shall be governed in every particular by the laws of this State governing a general election. The term of office to be held severally by the trustees so elected and by their successors shall be six years from the second Tuesday of March next succeeding the dates of their several elections, and until their successors shall have been elected and qualified; provided, in case of vacancy in said board such vacancy shall be filled by appointment by the governor until the next general election. Said board of trustees may appoint an executive committee of three chosen out of their own number, which committee, when said board is not in session, shall have the management

and control of the university and of its affairs, and for that purpose shall have and exercise all the powers which are necessary and proper for such object, except in so far as the board may reserve such powers to itself, and any powers granted at any time by said board to such executive committee the board may at any time revoke.

SEC. 19. To equalize the advantages of the University of Illinois to all parts of the State, there shall be awarded annually, as hereinafter provided, to each county of the State one State scholarship, which shall entitle the holder thereof, who shall be a resident of the senatorial district to which he is accredited, to instruction in any or all departments of said University of Illinois for a term of four years, free from any charge for tuition or any incidental charge, unless such incidental charges shall have been made for materials used or for damages needlessly done to property of the university: *Provided*, That in counties having two or more senatorial districts there shall be awarded annually one additional scholarship for each of said senatorial districts.

SEC. 20. A competitive examination under the direction of the superintendent of public instruction shall be held at the county court-house in each county of the State upon the first Saturday of June in each and every year by the county superintendent of schools upon such branches of study as said superintendent of public instruction and the president of said university may deem best.

SEC. 21. Questions for such examinations shall be prepared and furnished by the president of the university to the superintendent of public instruction, who shall attend to the printing and distribution thereof to the several county superintendents of schools prior to such examinations.

SEC. 22. In case any candidate who shall be awarded a scholarship shall fail to pass the entrance examination to the university, or shall fail to claim the privileges of such scholarship, or having claimed the privileges shall be expelled, or for any reason shall abandon his right to or vacate such scholarship either before or after entering thereupon, then the candidate certified to be next entitled in the same county shall become entitled to the same. In case any scholarship belonging to any county shall not be claimed by any candidate resident in that county, the superintendent of public instruction may fill the same by appointing some candidate first entitled to a vacancy in some other county, after notice has been served upon the county superintendent of said first-mentioned county.

SEC. 23. The county superintendents shall, within ten days after such examination, make and file in the office of the superintendent of public instruction certificates, in which they shall name all the candidates examined and specify the order of their excellence; and such candidates shall, in the order of their excellence, become entitled to the scholarships belonging to their respective counties. The examination papers handed in by each candidate shall also be filed with the certificate of examination.

SEC. 24. Candidates to be eligible to said scholarship shall be at least 16 years of age, and shall have been bona fide residents of their respective counties for at least one year immediately preceding the examination.

SEC. 25. Any student holding a State scholarship, and who shall make it appear to the satisfaction of the president of the university that he requires leave of absence for the purpose of earning funds to defray his expenses while in attendance, may, in the discretion of the president, be granted such leave of absence, and may be allowed a period not exceeding six years from commencement thereof for the completion of his course at said university.

SEC. 26. Notices of the time and place of the examination shall be given in the schools having pupils eligible thereto prior to the 1st day of January in each year. The superintendent of public instruction shall attend to the giving of the notices hereinbefore provided for; he may in his discretion direct that the examination in any county may be held at some other time and place than that hereinbefore specified; he shall keep full records in his department of the reports of the different examiners, showing the age, post-office address, and standing of each candidate, and shall notify candidates of their rights under this act; he is hereby charged with the general supervision and direction of all matters in connection with the filling of such scholarships; he shall determine any controversy which may arise under this act.

SEC. 27. Students enjoying the privileges of State scholarships shall, in common with other students of said university, be subject to all the examinations, rules, and requirements of the board of trustees and faculty as herein provided.

SEC. 28. Nothing herein contained shall be construed to prevent the board of trustees of said university from granting such other free scholarships as in their discretion may be deemed best.

SEC. 29. The trustees of the University of Illinois are hereby authorized and

directed to establish a chemical and biological survey of the waters of the State in connection with the said university.

SEC. 30. It shall be the duty of the university to collect facts and data concerning the water supplies of the State; to collect samples of waters from wells, streams, and other sources of supply; to subject these samples to such chemical and biological examination and analysis as shall serve to demonstrate their sanitary condition, and to determine standards of purity of drinking waters for the various sections of the State; to publish the results of these investigations in a series of reports to be issued annually or oftener, to the end that the condition of the potable waters of the State may be better known and that the welfare of the people of the various communities of the State may thereby be conserved.

SEC. 31. For the installation and support of said survey there is hereby appropriated the sum of \$3,000 per annum.

SEC. 32. The auditor of state is hereby authorized and directed to draw his warrants quarterly, in advance, on the treasurer for the sums hereby appropriated, upon the order of the chairman of the board of trustees of the University of Illinois, attested by the secretary, and with the corporate seal of the university: *Provided*, That no part of said sums shall be due and payable to said institution until satisfactory vouchers in detail, approved by the governor, shall be filed with the auditor, for the expenditure of the last quarterly installment of appropriations herein made.

SEC. 43. To assist and encourage useful education among the farmers and for developing the agricultural resources of the State, an organization under the name and style of "Illinois Farmers' Institute" is hereby created and declared a public corporation of the State.

SEC. 44. It shall consist of three delegates from each county of the State, elected annually at the farmers' institutes for said county by the members thereof.

SEC. 45. The affairs of the "Illinois Farmers' Institute" shall be managed by a board of directors, consisting of (1) State superintendent of public instruction, (2) professor of agriculture of the University of Illinois, (3) president of the State board of agriculture, (4) president of the State Horticultural Society, (5) president of the State Dairymen's Association, and one member from each Congressional district of the State, to be selected by the delegates from the district present at the annual meeting of this organization: *Provided*, That the members first selected from the Congressional districts of even numbers shall serve for one year and the members first selected from the Congressional districts of odd numbers shall serve for two years, and that the members selected thereafter to fill expired terms of office shall serve for a period of two years.

SEC. 46. The board of directors of the Illinois Farmers' Institute shall have sole care and disposal of all funds that may be appropriated by the State to sustain the organization, and shall expend the same in such manner as in their judgment will best promote the interest in useful education among the farmers and develop the agricultural resources of the State. The Illinois Farmers' Institute shall make annual report to the governor of its transactions, which report shall include papers pertaining to its work and addresses made at the annual meeting of the organization, and a classified statement of all the moneys received and of all expenditures made; and 20,000 copies of said report shall be printed on or before September 1 of each fiscal year, one-half for the use of the Illinois Farmers' Institute and the remainder to the secretary of state for distribution. It shall make no appropriation without funds in hand to meet the same, and the State of Illinois shall in no event be held liable or responsible for any debt, obligation, or contract made by the Illinois Farmers' Institute or its board of directors.

SEC. 47. There shall be held annually, under the direction of the board of directors, between October 1 and March 1 following of each year, a public meeting of the delegates from county farmers' institutes and of farmers of this State, at such time and place as may be determined by the board of directors, of not less than three days' duration, which meeting shall be held for the purpose of developing the greater interest in the cultivation of crops, in the care and breeding of domestic animals, in dairy husbandry, in horticulture, in farm drainage, in improved highways, and general farm management, through and by means of liberal discussion of these kindred subjects, and any citizen may take part in these meetings, but only duly elected and accredited delegates from county farmers' institutes shall be permitted to vote in the election of the board of directors.

SEC. 48. The members of each new board of directors shall enter upon their duties the next Tuesday after their election and hold their offices for one or two years, as provided in section 3, or until their successors are elected and enter upon their duties; it shall have power to fill vacancies in the board; it shall organize by the election of a president, vice-president, secretary, treasurer, and State super-

intendent of the Farmers' Institutes, and such other officers or agents as may be deemed proper for organizing and conducting the work of the organization, who shall hold their offices for one year, unless removed sooner by the board, and shall perform such duties as may be required of them by rules of the board. The secretary, treasurer, and superintendent may be other than members of the board.

SEC. 49. Rooms in the capitol building shall be assigned to the officers of this organization by the proper authority, which shall then be under the control of the board of directors.

SEC. 50. The board of directors may make and enforce such rules and by-laws, not in conflict with the laws of this State, as will render its work most useful and efficient.

SEC. 51. For the purpose mentioned in the preceding sections, said board of directors may use such sum as it may deem proper and necessary, not exceeding the amount appropriated therefor by the general assembly from the general fund for that purpose: *Provided, further*, That the (1) State superintendent of public instruction, (2) professor of agriculture of the University of Illinois, (3) president of the State board of agriculture, (4) president of the State Horticultural Society, (5) president of the State Dairymen's Association, and the present Congressional representatives of the Illinois Farmers' Institute Association shall constitute the first board of directors of this organization, who shall have charge of the affairs of the same until their successors have been duly elected and enter upon their duties, as provided in this act.

[By an act of the general assembly passed February 21, 1861, there was incorporated an institution called the Illinois Agricultural College "for the purpose of instruction in practical and scientific agriculture." For the purpose of enabling the college to perform this duty, by the eighth section of the charter, the State gave to the corporation the college and seminary lands of the State, and the evidence shows that these were subsequently sold by the college for \$58,000. The school was opened in 1863. "But it was in character no more than a common school. The directors provided no means for teaching scientific agriculture, and erected no workshops nor provided facilities for teaching the mechanic arts. On the contrary, the whole effort seems to have been a miserable failure. These facts, as shown by the evidence in the case, seem most clearly to establish a waste and perversion of the fund donated by the State. That fund had been granted to the State by Congress for the purpose of maintaining a college or seminary of the character created by this charter, and there would seem to be no doubt that the general assembly intended, when they donated it, that it should be held as a sacred trust fund for the establishment, improvement, and carrying on a college of the character they were incorporating. It manifestly was not to maintain a common school for that particular neighborhood. It was intended to be an institution for the benefit of young men throughout the entire State, and they so provided by the charter; but the trust was violated, the fund perverted or squandered, and the purpose of the general assembly defeated, and the benefits intended to be conferred by a judicious use of the trust fund were lost. The corporation, however, claim that by the amendment of their charter by act of February 12, 1867, they were released from the duty of imparting knowledge of practical agriculture and the mechanic arts. That section provides that they shall be permitted to impart instruction in all the branches taught in similar institutions in any of the States of the Union, or contemplated by the act of Congress donating land to the several States to establish agricultural colleges.<sup>a</sup> We fail to perceive how this in anywise releases the college from any duty imposed by the charter. It may enlarge their powers, but surely does not diminish them. That enactment does not purport to, nor does it, release the corporation from any duty imposed. The corporation having accepted of the donation and their charter, it was with the implied agreement that they would perform, in good faith, the duties imposed by the charter. One of the duties imposed was that they would hold the lands donated, or the proceeds of their sale, for the 'purpose of establishing, improving, and carrying on said college and farm.' This was the trust created, but it has been abused, the fund misappropriated and wasted, and the institution is shown to have become incapable of executing the trust, in the future, in accordance with the terms of the charter. This being true, and a court of equity having jurisdiction of trusts and trust property, it may, in case of waste, perversion, or mobility or indisposition of the trustee to execute the trust, seize the property or fund and place it in the hands of a trustee who will execute the trust.

In this case the land was granted by the General Government to the State, in trust for agricultural and educational purposes—not for common-school purposes, but as a college and seminary fund for education of a higher character, and to that end it was intrusted to this corporation; and when the fund was put in the land and buildings of the colleges, it did not lose its character of trust funds. It still retained that character, although perverted to the use of a district school, using the buildings for that purpose, and renting the lands and appropriating the rents to the same purpose. \* \* \* There was also, on the part of the court below in dismissing the bill, most manifest error in rendering a decree for costs, as the State is never liable to be decreed to pay costs, and the attorney-general only acted in his official character. The Attorney-General v. The Illinois Agricultural College et al. (1877), 85 Ill.

In 1853 the general assembly of Illinois passed an act, the third section of which provided that: All property described in this section, to the extent herein limited, shall be exempt from taxation. That is to say (1) all lands donated for school purposes and not sold or leased; all public schoolhouses and houses used exclusively for public worship, the books and furniture therein, and the grounds attached to such buildings necessary for the proper occupancy, use, and enjoyment of the same and not leased, or otherwise used with a view to profit; all colleges, academies; all endowments made for their support; all buildings connected with the same and all lands connected with institutions of learning not used with a view to profit. This provision

<sup>a</sup> The fourth section reads: That said act [of February 21, 1861] be so amended as to permit said college to impart instruction in all the branches taught in similar institutions in any of the States of this Union, or contemplated in the act of Congress donating lands or scrip to the several States for the establishment of agricultural colleges. Private Laws, 1867, p. 1.

shall not extend to leasehold estates of real property held under the authority of any college or university of learning. On an appeal from a judgment for taxes of 1870 assessed against lands belonging to the board of trustees of the Illinois Industrial University, against whom the board of supervisors of Champaign County obtained a judgment in the circuit court of Champaign County, the supreme court said: "This is an appeal from a judgment for taxes of 1870 assessed against lands belonging to appellants and conveyed to them in consideration that the Industrial University should be located at Urbana in this State. It is clear that the title to these lands is in appellants in trust and that the institution and its property is under the control of the State and is held in trust for the State; that as it is the property of the State it is exempt from taxation. \* \* \* The only question, then, presented by this record is whether this is the property of the State. If so then it is exempt from taxation. To determine that question we must turn to the act which brought this institution into existence. Congress having donated a large amount of land scrip to the State for the purpose of founding a university and the board of supervisors of Champaign County having offered to donate a college edifice and a large quantity of land if the State would locate permanently the Illinois Industrial University at Urbana, in that county, the general assembly on the 28th day of February, 1867, created a body corporate to govern the fund and the university. The trustees were to be appointed by the governor and to be confirmed by the senate. \* \* \* They were required to permanently locate the institution at Urbana and to provide the requisite buildings, apparatus, and conveniences, to fix the rates of tuition, to appoint the professors, etc. \* \* \* The appropriations at each session of the legislature might be referred to as showing that the general assembly regard and have always regarded this as a State institution. The fund was donated to the State in the first place for the establishment and maintenance of an institution of learning which this represents, and we fail to find the slightest indication of an intention on the part of the State to part with either the ownership of the property or control of the institution. It is true that the general assembly have created a body corporate as the most convenient mode of controlling the institution, its property, and affairs, but it will be observed that the State retains the power of appointing its trustees, and no doubt has power through agents other than the trustees to sell and dispose of the property of the institution, or they may at pleasure amend or even repeal the charter as public policy or the interest of the university may require. It will be observed that the persons appointed for the government of the university are created and called trustees. They derive all their powers from the State and they act for and on behalf of the State, and the power which conferred authority on them to act may withdraw or modify it at pleasure. Had the general assembly intended that the property might be sold for any purpose, some language indicating such intention no doubt would have been employed. In any view in which we have been able to consider the case we have been irresistibly impelled to the conclusion that this real estate, although conveyed to the corporate body, belongs to and is under the entire control of the State when disposed to exercise the power, and, being property of the State, we have seen the constitution authorized its exemption from taxation, and the general assembly has exempted it. As an irresistible conclusion it follows that the judgment of the court below is erroneous, and it must be reversed." 76 Ill. (1875). Other decisions more or less applicable are Board of Education v. Greenbaum & Sons, 39 Ill. "The property of the normal university is not the property of the State, but is the property of the board of education of the State of Illinois," and the only remedy a creditor has against it is by judgment and execution as in a case against an individual or other corporation not of a municipal character." Also 71 Ill. Thomas v. Board of Trustees of the Illinois Industrial University et al. "The Illinois Industrial University is a State institution and not subject to the mechanics-lien law," which is the converse of Board of Education v. Greenbaum in 39 Ill. and Board of Education v. Bakewell, 122 Ill., reaffirming 59 Ill.

## INDIANA.

Constitution (1851), Article VIII: SECTION 1. Knowledge and learning generally diffused throughout a community being essential to the preservation of a free government, it shall be the duty of the general assembly to encourage by all suitable means, moral, intellectual, scientific, and agricultural improvement, and to provide by law for a general and uniform system of common schools, wherein tuition shall be without charge, and equally to all.

SEC. 7. All trust funds held by the State shall remain inviolate and be faithfully and exclusively applied to the purposes for which the trust was created.

[The following matter is taken from the Revised Statutes of Indiana, embracing all general laws in force October 1, 1901, by Frank A. Hauer, 2 vols., Rochester, N. Y., 1901.]

SEC. 4662. The State of Indiana accepts and claims the benefits of the provisions of the acts of Congress approved July 2, 1862, and April 14, 1864, and assents to all the conditions and provisions in said acts contained.

SEC. 4663. The governor of this State for the time being and [here are named four other persons] and their successors are created a body corporate, under the name of "The Trustees of the Indiana Agricultural College."

SEC. 4664. Said trustees shall, by the hand of their treasurer, claim and receive from the Secretary of the Interior the land scrip to which this State is entitled by the provisions of said acts of Congress; and under their direction said treasurer shall sell the same in such manner and at such times as shall be most advantageous to the State, and shall invest the proceeds thereof and any interest that may accrue thereon in the stocks of the United States or of this State yielding not less than 5 per cent per annum upon the par value of the stocks; and said principal and interest shall continue to be so invested until further provision shall be made by the general assembly of this State for fulfilling the requirements of said acts of Congress.

SEC. 4665. The donation offered by John Purdue, as set forth and communicated to the present general assembly in the message of the governor on the 16th day of

April, 1869, and the donations offered by the county of Tippecanoe, the trustees of the Battle Ground Institute, and the trustees of the Battle Ground Institute of the Methodist Episcopal Church, as set forth and communicated to the general assembly at its last session in the message of the governor of the 27th day of January, 1869, are hereby accepted by the State of Indiana.

SEC. 4666. The college contemplated and provided by the act of Congress approved July 2, 1862, is hereby located in Tippecanoe County, at such point as may be determined before the 1st day of January, 1870, by a majority vote of the trustees of the Indiana Agricultural College, and the faith of the State is hereby pledged that the location so made shall be permanent.

SEC. 4667. In consideration of the said donation by John Purdue, amounting to \$150,000, and of the further donation of 100 acres of land appurtenant to the institution, and on condition that the same be made effectual, the said institution, from and after the date of its location as aforesaid, shall have the name and style of "Purdue University," and the faith of the State is hereby pledged that the said name and style shall be the permanent designation of said institution without addition thereto or modification thereof.

SEC. 4668. From and after the date of the location made as aforesaid, the corporate name of the trustees of the Indiana Agricultural College shall be "The Trustees of Purdue University," and they shall take in charge, have, hold, possess, and manage, all and singular, the property and moneys comprehended in said donations, as also the funds derived from the sale of the land scrip donated under said acts of Congress, and the increase thereof, and all moneys or other property which may hereafter at any time be donated to and for the use of said institution. They shall also have power to organize said university in conformity with the purposes set forth in said acts of Congress, holding their meetings at such times and places as they may agree on, a majority of their number constituting a quorum. They shall provide a seal; have power to elect all professors and teachers, removable at their pleasure; fix and regulate compensations; do all acts necessary and expedient to put and keep said university in operation, and make all by-laws, rules, and regulations required or proper to conduct and manage the same.

SEC. 4669. In further consideration of his said donation John Purdue shall, from and after the taking effect of this act, be added as a member to said trustees of the Indiana Agricultural College, and he shall also be a member of said trustees of Purdue University. Should he at any time cease to be such member he shall be continued as an advisory member of said trustees; and he shall, during his lifetime, have visitorial power for the purpose of inspecting the property, real and personal, of said university, recommending to the trustees such measures as he may deem necessary for the good of the university, and investigating the financial concerns of the corporation. And he is authorized to make report of his examination, inspection, and inquiries to the general assembly at any session thereof.

SEC. 4670. This act shall be subject to future amendment or repeal, except so far as it provides for the acceptance of donations, the location of the college, the name and style thereof, and the rights and privileges conferred upon John Purdue.

SEC. 4671. On the 1st day of July, 1895, it shall be the duty of the governor of this State to appoint nine trustees for the Purdue University, two of whom shall be nominated by the State board of agriculture, one by the State board of horticulture, and six selected by the governor himself: *Provided*, That no more than two such trustees as may be selected by the governor himself shall be appointed from any one Congressional district: *And also provided*, That the first board so appointed shall include the three persons who at that time are the last nominees of the State board of agriculture and the State board of horticulture: *And also provided*, That the board of trustees now in office shall remain in office and perform all the duties thereof, as now required by law, until their successors are duly appointed and qualified, as provided in this act.

SEC. 4672. The persons so appointed shall constitute the board of trustees of said university, and shall hold their offices as follows: Three members of the first board shall hold their offices for two years, three for four years, and three for six years, and all until their successors are appointed; and at the expiration of the term of office of any of the members of the first or any subsequent board their successors shall be appointed in like manner, and with like nomination, and with like restrictions, as provided in this act, to hold their offices for the term of six years and until their successors are appointed.

SEC. 4673. If from any cause a vacancy occurs in said board the same shall be filled by appointment to fill the unexpired term, the person appointed to fill such

vacancy being nominated and appointed in the same manner as his predecessor had been at the commencement of such term.

SEC. 4674. Said trustees shall, at their first meeting after their appointment, and every two years thereafter, choose a president of said board, and they shall at such meeting and every two years thereafter, and whenever a vacancy occurs, elect by ballot a secretary and a treasurer, neither of whom shall be a member of the board, whose compensation shall be fixed by the trustees. The said treasurer shall give such bond to the State of Indiana, in any sum not less than \$50,000, for the faithful execution of his trust, with sufficient sureties, as said trustees may require; and he shall receive, take charge of, and, under the direction of said trustees, manage all stocks and funds belonging to said university.

SEC. 4675. The board of commissioners of each county in this State may appoint, in such manner as it may choose, two students or scholars to Purdue University, who shall be entitled to enter, remain, and receive instruction in the same upon the same conditions, qualifications, and regulations prescribed for other applicants for admission to or scholars in said university: *Provided, however*, That every student admitted to said university by appointment by virtue of this act shall in no wise be chargeable for room, light, heat, water, tuition, janitor, or matriculation fees; and said student shall be entitled, in the order of admittance, to any room in the university then vacant and designed for the habitation or occupancy of a student, and such student so admitted shall have prior right to such room, subject to the rules of the university, over any student not appointed and admitted as aforesaid.

SEC. 4676. No more than two students at the same time from any one county shall be entitled to admittance to said university under the provisions of this act. But the board of commissioners of each county may, from time to time, appoint, as aforesaid, to any vacancy in its appointments.

SEC. 4677. The trustees of Purdue University, by their treasurer, are hereby authorized on or after the 1st day of April, 1881, to surrender to the treasurer of the State the bond executed to said university by the State of Indiana bearing date April 1, 1878, and payable in the sum of \$200,000 on April 1, 1881, and a like bond executed by the State to said university dated April 1, 1879, and payable in the sum of \$125,000 on April 1, 1884; and also to pay out of the proceeds of the United States 5 per cent bonds now held by the university (which said trustees are hereby empowered to sell) the sum of \$15,000 to said treasurer of State, who thereupon is hereby directed to issue and deliver to said treasurer of Purdue University a nonnegotiable bond of the State of Indiana, to be signed by the governor and State treasurer and attested by the secretary of state and the State seal (the same to be dated April 1, 1881, and payable twenty years after its date to the trustees of Purdue University and their successors, with interest at the rate of 5 per cent per annum, payable quarterly after date of the bond), all for the use of Purdue University—said bonds surrendered and \$15,000 paid constituting the endowment fund of said university derived from the gift of the United States.

SEC. 4677b. The trustees of Purdue University are hereby empowered to dedicate for public streets such strips of land extending through or along the grounds owned by said university as they may deem for the best interest of said university.

SEC. 4677c. Whenever any individual or individuals shall give, donate, or bequeath a sum of money or other valuable property for the purpose of establishing an institute of technology or other special schools in connection with Purdue University in and on the grounds of said university, the trustees of said university are hereby authorized and empowered to accept such donation, gifts, or bequest for and on behalf of the State of Indiana for such institute on such terms as may be agreed upon by and between such trustees and said donor or donors or devisors; and the said trustees are hereby authorized to establish, maintain, and operate such an institute in connection with Purdue University: *Provided*, That such institute of technology shall be freely open to students upon the same terms upon which Purdue University is open to students: *And provided*, That nothing in this act shall enable or authorize said trustees to make any contract with said donor or donors by which any debts shall be created beyond or above current legislative appropriations to the university: *And provided further*, That the terms upon which such donations are received and accepted shall not be effective unless the same are indorsed and approved by the governor of the State of Indiana.

SEC. 4677g. It is hereby made the duty of the committee of experimental agriculture and horticulture of the board of trustees, together with the faculty of the school of agriculture of Purdue University, to appoint, before November 1 of each year, suitable persons to hold in the several counties of this State, between the 1st day of November and the 1st day of April of each year, county institutes for the

purpose of giving to farmers and others interested therein instruction in agriculture, horticulture, agricultural chemistry, and economic entomology.

SEC. 4677h. Such institutes shall be held at such times and places as said committee and faculty may determine, and under such rules, regulations, and methods of instruction as they may prescribe: *Provided, however,* That such institutes shall be so conducted as to give those attending the results of the latests investigations in theoretical and practical agriculture and horticulture.

SEC. 4677i [sec. 4677g above]. For the purpose of carrying out the provisions of this act, paying the salaries of instructors and other necessary expenses, the sum of \$10,000 is hereby appropriated, to be expended under the direction of the said committee of said board of trustees, and they shall annually report such expenditures and the purposes thereof to the governor.

SEC. 4894. Before any commercial fertilizer is sold or offered for sale in the State of Indiana the manufacturer, dealer, importer, agent, or party who causes it to be sold or offered for sale, by sample or otherwise, within the State of Indiana, shall file with the State chemist of Indiana a statement that he desires to offer for sale in Indiana material for manurial purposes, and also a certificate for registration stating the name of the manufacturer, the location of the principal office of the manufacturer, the name under which the fertilizer will be sold, the names of the towns in Indiana in which it will be offered for sale, and the minimum percentage of nitrogen, of potassium oxide ( $K_2O$ ) soluble in water, of phosphoric acid ( $P_2O_5$ ), and in the case of acidulated goods the minimum percentage of water, soluble and reverted phosphoric acid, and of insoluble phosphoric acid which the manufacturer or party offering the fertilizer for sale guarantees the fertilizer to contain.

SEC. 4898. The professor of agricultural chemistry at Purdue University is hereby constituted the State chemist of Indiana, and it shall be his duty to comply with the provisions of this act so far as they relate to him. \* \* \* The State chemist is hereby empowered to prescribe and enforce such rules and regulations as he may deem necessary to carry into effect the full intent and meaning of this act.

Laws of 1895: SECTION 1. There shall be assessed and levied upon the taxable property of the State of Indiana in the year 1895 and in each year thereafter a tax of one-twentieth of a mill for the use of Purdue University. (March 8, 1895.)

[In a case decided by the supreme court of Indiana in 1882, known as "The State ex rel. Stallard v. White et al." (the faculty of Purdue University), 82 Ind., the court expressed itself in these terms: "Purdue University constitutes no part of our system of common schools, and has no direct connection with that system; but it is an institution of learning primarily endowed by Congress, and continued in existence very largely by appropriations made by the general assembly of this State. It is, therefore, an educational institution sustaining relations to the people at large analogous to those occupied by other public schools and colleges of the State, maintained at public expense, and one in which all the inhabitants of the State have a common interest. The general principles underlying the educational system of the State are, consequently, applicable to the government and control of Purdue University, and in the absence of express legislative provisions must be invoked in determining the powers which that institution may exercise. The fourth section of the act establishing Purdue University \* \* \* confers no greater power on the trustees of Purdue University, as regards making rules and regulations for its conduct and management, than is usually conferred upon like officers of similar institutions, and leaves the question as to who are entitled to admission as students in that university to be determined by the principles underlying our general system of education, to which reference has already been made. The admission of students in a public educational institution is one thing, and the government and control of students after they are admitted, and have become subject to the jurisdiction of the institution, is quite another thing. The first rests upon well-established rules, either prescribed by law or sanctioned by usage, from which the right to admission is to be determined. The latter rests largely in the discretion of the officers in charge, the regulations prescribed for that purpose being subject to modification or change from time to time as supposed emergencies may arise. Having in view the various statutes in force in this State touching educational affairs, and the decisions of this court as well as of other courts bearing on the general subject, we think it may be safely said that every inhabitant of this State, of suitable age and attainments, and of reasonably good moral character, not afflicted with any contagious or loathsome disease, and not incapacitated by some mental or physical infirmity is entitled to admission as a student in the Purdue University. \* \* \* [But] every student upon his admission into an institution of learning impliedly promises to submit to and to be governed by all the necessary and proper rules and regulations which had been or may thereafter be adopted for the government of the institution, and the exaction of any pledge or condition which requires him to promise more than that operates as a practical abridgment of his right of admission, and involves the exercise of a power greater than has been conferred upon either the trustees or the faculty of Purdue University. Regulations adopted by persons in charge of a school are analogous to by-laws enacted by municipal and other corporations, and both will be annulled by the courts when found to be unauthorized, against common right, or palpably unreasonable. In the first place the pledge tendered by the president to Hawley [in regard to disconnecting himself from a 'Greek fraternity'] was not shown to have been authorized by any previous general regulation adopted for the government of the university. As applicable to Hawley it was therefore special, exceptional, and apparently not demanded by any competent authority. In the next place it carried with it the implication that membership in the Sigma Chi fraternity might properly be treated as a disqualification for admission as a student in the university, a doctrine wholly inadmissible in its application to Purdue University, or to any of the other public schools or colleges of the State. If mere membership in any

of the so-called Greek fraternities may be treated as a disqualification for admission as a student in a public school, then membership in any other secret or similar society may be converted into a like disqualification, and in this way discriminations might be made against large classes of the inhabitants of the State, in utter disregard of the fundamental ideas upon which our entire educational system is based. At the request of the parties we have considered this case upon the theory that the regulation imposing disabilities on persons already members of the Greek fraternities was adopted by the express authority of the trustees, and our conclusion is that so much of the regulation No. 3 adopted by the faculty as may be construed to impose disabilities on persons already members of the Greek fraternities, and as requires a written pledge as a condition of admission, is both ultra vires and palpably unreasonable, and hence inoperative and void, and that the pledge tendered to Hawley was one which the faculty had no legal right to demand as a condition of his admission.

In the case of Marks, treasurer of Tippecanoe County, v. The Trustees of the Purdue University, it was decided that the location of a State educational institution within the boundaries of a minor civil division or jurisdiction of a State is a sufficient consideration for a grant of money by that minor civil division. 'Two objections are made,' said the court, 'to the action of the board of county commissioners, (1) that it requires local taxation for a State purpose, and (2) that it is a special law and not of uniform operation. The sole object and purpose of the donation was to secure the location of the college in Tippecanoe County. \* \* \* It does not appear that the donation was made, as is argued by counsel for the appellant, to aid in the erection of a college building, which it was the duty of the State to erect and maintain. It may be conceded that the college or university is a State institution, and the question arises whether taxes may be assessed in a county to liquidate a debt contracted by the county in securing the location of such State institution in the county; for if not, the debt can not be valid. \* \* \* While the university is a State institution, and every citizen will have an equal right under the same circumstances to avail himself of its privileges, still the location of it in a given county will doubtless confer upon that county many local benefits of pecuniary value. The parents of the county can send their sons and perhaps their daughters to the college to be educated at a less expenditure of time and money than would be incurred if it were situated at a more remote point in the State. The college, with its professors, tutors, attendants, and students, will probably diffuse much more money throughout the community than would otherwise circulate. It may also add to the educated and intelligent population of the place, and be the means of stimulating the industry and increasing the wealth and moral worth of the community, thereby enhancing the attractions of society and the value of property. \* \* \* The fact that the college is a State institution can not change the character or nature of the obligation entered into by the county. Railroads are in some sense State institutions, and yet local subscriptions by counties and cities are upheld. Highways and streets are State institutions, to the proper use and enjoyment of which all citizens have an equal right; yet local taxation to improve and keep them in order is constantly maintained. The taxation being merely for a county purpose, the provisions of section 1 of article 10 are complied with if taxes are uniform throughout the county. It remains to inquire whether the law in question is objectionable as being local or special when a general law could have been made applicable; or in other words whether it violates section 22 of article 24 of the constitution. The subject of the law was local, and where such is the case the objection can not prevail. The college could have but one location, and but one county could have actually made a donation on condition of its location therein, as the condition could only have been performed as to one county. \* \* \* Thus there are laws creating criminal courts in particular counties. \* \* \* There can be no doubt on general principles that the location of the college in Tippecanoe County was a sufficient consideration to support the promise on the part of the county. The offer on the part of the county and its acceptance by the legislature, together with the location of the college in Tippecanoe County, constituted a valid and binding contract.'"]

## IOWA.

Constitution (1857), Article 9. SECTION 1. The educational and school fund and lands shall be under the control and management of the general assembly of this State.

SEC. 3. The general assembly shall encourage by all suitable means the promotion of intellectual, scientific, moral, and agricultural improvement.

[The following matter is taken from the "Annotated Code of the State of Iowa, containing all the laws of a general nature enacted by the twenty-sixth general assembly at the extra session which adjourned July 2, 1897, published by the authority of the State. Des Moines, 1897.]

SEC. 2645. Legislative assent is given to the purposes of the various Congressional grants to the State for the endowment and support of a college of agriculture and mechanic arts, and an agricultural experiment station as a department thereof, upon the terms, conditions, and restrictions contained in all acts of Congress relating thereto, and the State assumes the duties, obligations, and responsibilities thereby imposed. All moneys appropriated by the State because of the obligations thus assumed, and all funds arising from said Congressional grants shall be invested or expended in accordance with the provision of such grant, for the use and support of said college located at Ames.

SEC. 2646. [Amended by ch. 76, acts of 1898, q. v.] The college shall be under the management and control of a board of trustees, but neither the president nor other officer or employee of the college and farm [at Ames] shall be eligible to membership therein.

SEC. 2647. The board of trustees shall have power: (1) To elect a chairman from their number, a president of the college, a secretary, a treasurer, professors and other teachers, superintendents of departments, steward, librarian, and such other officers as may be required for the transaction of its business, fix the salaries of officers and prescribe their duties, and appoint substitutes who shall discharge

the duties of such officers in their absence; (2) to manage and control the property of the college and farm, whether real or personal; (3) to arrange courses of study and practice, and to establish such professorships as may seem best to carry into effect the provisions of this chapter, and prescribe conditions of admission to the college; (4) to grant diplomas on the recommendation of the faculty to any students who have completed any of the courses of study prescribed by it or an equivalent thereof; (5) to remove any officer by a majority vote of all its members; (6) to direct the expenditure of all the appropriations the general assembly shall from time to time make to said college and farm, and the income arising from the Congressional grants and all other sources; (9) to keep a full and complete record of their proceedings, and to do such other acts as are necessary to carry out the intent and meaning of this chapter.

SEC. 2648. There shall be adopted and taught practical courses of study, embracing in their leading branches such as relate to agriculture and the mechanic arts, and such other branches as are best calculated to thoroughly educate the agricultural and industrial classes in the several pursuits and professions of life, including military tactics, and as a separate department, a school of mines, in which a complete course in theoretical and practical mining in its different branches shall be taught.

SEC. 2649. Tuition in the college herein established shall be forever free to pupils from the State over 16 years of age who have been residents of the State six months previous to their admission. Each county in this State shall have a prior right to tuition for three scholars from such county, the remainder, equal to the capacity of the college, shall be by the trustees distributed among the counties in proportion to the population subject to the above rule.

SEC. 2650. Annual meetings of the board of trustees shall be held at the college on the second Wednesday following the first Monday of November. The college year shall begin on the following Thursday and end on the second Wednesday after the first Monday of November of the following year.

SEC. 2651. The president shall manage and control the affairs of the college and farm, subject to such rules as may be prescribed by the board of trustees, and shall report to it at its annual meeting and at such other times as it directs all his acts as such president and the condition of the several departments, with his recommendations for the future management thereof.

SEC. 2652. The secretary shall keep a record of the proceedings of the board, and all documents and papers connected with the office, and conduct the correspondence. All acts of the board relating to the management, disposition, or use of the lands, funds, or other property of the institution shall be entered of record and show how each member voted upon each proposition. He shall also prepare the biennial report of the board to the governor, and report to the executive council annually and at such other times as may be required by it all loans made since his last report to it; and also, to the board, all loans made since its last meeting, unless otherwise ordered; but such reports must be made at least quarterly. Upon the election of any person to any office under the board, he shall give notice thereof to the secretary of state. He shall also keep an account with the treasurer, charging him with all money paid him and crediting him with the amounts paid upon the order of the board of audit, which account shall be balanced monthly.

SEC. 2653. The president and secretary shall constitute an auditing committee which, subject to the rules of the board of trustees, shall examine and audit all bills presented for payment for which an appropriation has been made, and a minute of such auditing shall be indorsed upon each bill and signed by both members of such committee. No bill shall be paid without such joint indorsement, unless allowed by the board. It shall examine the treasurer's books and vouchers monthly, and at such other times as it shall consider necessary, and all its proceedings shall be reported by the secretary to the board at its next meeting.

SEC. 2654. The treasurer shall receive and keep all notes and other evidence of indebtedness, contracts, and money arising from the income of the Congressional grant, appropriations of the general assembly, sales of the products of the farm, payments by students, and all other sources, and pay out the same upon bills for which appropriation has been made when audited as above prescribed, and retain such bills with receipt for their payment as his vouchers. He shall keep an accurate account of the revenue and expenditures of the college from all sources, so that the receipts and disbursements of each of its several departments shall be apparent at all times, and report to the board of trustees at their annual meeting and at such other times as they shall direct. He shall also execute duplicate receipts of all money received by him, specifying the source and the fund to which

it belongs, one of which must be filed with the secretary, and no receipt shall be valid unless the duplicate is so filed. He shall be elected annually, and give bond in double the highest amount of money likely to be in his hands at any one time, which bond shall be filed with the secretary of state. He may appoint a deputy, who shall receive such compensation as the board of trustees shall fix, and for whose acts he shall be responsible on his official bond.

SEC. 2655. The president and secretary shall have their offices in, and the deputy treasurer shall reside at, the college.

SEC. 2656. The board of trustees may sell the lands granted to the State by act of Congress and any lands acquired by purchase or otherwise for cash or upon a partial credit, not exceeding ten years, at such price as shall be fixed by the board, deferred payments to draw interest at the rate of 8 per cent per annum, payable annually in advance. Upon a failure to pay the annual interest or principal within sixty days after it becomes due and sixty days after notice thereof shall have been given in writing, by mail or otherwise, by the board or the land agent of the college to the holder of the lease, such holder shall forfeit all claim to said land and the improvements made thereon and all sums paid on said contract, unless an extension of time has been or is granted by said board.

[A case, in which was called in question the right of the legislature to empower the corporation it had created to carry out the purpose of the act of July 2, 1862, to act as a business agent in selling the lands given by the act, was decided by the supreme court of Iowa in 1870. (28 Iowa, p. 500.) The court said: "In accordance with an act of the legislature the trustees of the agricultural college leased a tract of college land to plaintiff, with the privilege to plaintiff of purchasing the land at a stipulated price at the end of the term; and he made the advance payment required by the law, which law authorized the trustees to insert a clause of forfeiture in the lease, which was inserted, stipulating that the trustees could declare the contract forfeited if a payment of rent or of interest should be in arrears for sixty days. The plaintiff failed to pay as stipulated for sixty days, and the trustees then declared the contract forfeited and sold the land to one Connor. The plaintiff, Smith, after forfeiture and sale, tenders the rent or interest in arrears and asks that the lease and sale to Connor be set aside. The only question that can be raised in this case is the power of the legislature to authorize a contract as above stated. The land belonging to the State, the legislature could fix and enforce the terms and conditions of a sale." In 69 Iowa there is a case (Chicago, Milwaukee and St. Paul Railway Company v. Bean), where the "Iowa Agricultural College and its lessees" were made parties (and are affirmed as parties by the supreme court) to condemnation proceedings by the railroad corporation. There is still another decision indirectly affirming the case in 28 Iowa. The syllabus, as far as it regards the agricultural college, reads: "Although agricultural college lands are required to be sold on time, in order to provide a fund for the college arising from the interest on the purchase price, the college may nevertheless receive the principal, with a bonus, when its interests will be promoted thereby; and where it does receive the principal, it will be presumed that its officers have acted rightly for the best interests of the college."] ]

SEC. 2657. It may lease such lands for a term not exceeding ten years, at an annual rental equal to 8 per cent per annum upon the appraised value of the tract, payable annually in advance, granting lessee, his heirs, or assigns, the privilege of purchasing, at the expiration of the lease, at the appraised value stated therein, or it may lease said lands without granting the privilege of purchase. A lessee failing to pay the annual rent or interest within sixty days after it becomes due and sixty days after notice thereof shall have been given in writing, by mail or otherwise, by the board or the land agent of the college to the holder of the lease, shall forfeit the same, with the interest paid thereon and all improvements made.

SEC. 2658. It may, at its option, cause to be received the purchase price of the land sold or leased, before the same becomes due, upon such terms and conditions of payment as it may regard for the best interests of the institution, and may renew leases as they expire.

SEC. 2659. After any leasehold interest has been sold for delinquent taxes, the holder of the tax-sale certificate may pay any interest or principal due by the terms of the lease, or do any other act necessary to prevent a forfeiture of the lease, and the proper voucher for such payment shall be filed with the auditor of the county where the land is situated.

SEC. 2660. Where any leasehold interest has been sold for delinquent taxes and a treasurer's deed issued thereon, the grantee therein, his heirs, or assigns, shall be entitled to purchase the land so conveyed, at the price and on the terms specified in the lease, and receive a patent therefor. If such lease expires before the holder of the tax-sale certificate will be entitled to a treasurer's deed, such certificate holder may pay the amount required by the terms thereof to acquire the title thereto and receive a conveyance of the same.

SEC. 2661. The right of the tax-sale purchaser or his assigns to pay any amount due by virtue of any lease shall be shown by a copy of the certificate of tax sale or treasurer's deed thereunder, duly certified by the officer executing the same, and if no tax deed has been issued the auditor shall certify that redemption from

the sale has not been made. Such copy and certificate shall be filed with the secretary of the board of trustees and become a part of the records of his office.

SEC. 2662. The board of trustees shall certify to the auditor of each county in which leased college lands are situated, on or before the 5th day of January of each year, a list thereof subject to taxation, with the name of each lessee, the date and terms of each lease, the amounts to be paid thereon, and the dates of payment.

SEC. 2663. All leases and renewals thereof shall be assignable, and the owner, whether holding one or more leases or renewals, who has made the annual payments therein required, shall be entitled to all the benefits thereof and have the privilege of purchasing the tract or tracts of lands as provided therein, and upon the payment of such purchase money shall be entitled to a patent for the land described in said lease or leases.

SEC. 2664. When a sale is made of any lands the president shall execute to the purchaser a certificate, countersigned by the secretary, stating the fact of purchase, the name of the purchaser, the description of the land, and its fixed value. Upon payment of the purchase price to the State treasurer, the buyer or his assigns will be entitled to a patent or patents therefor, and upon presentation of such certificate to the secretary of state, with the receipt of the treasurer showing full payment, stating the amount, he shall issue to the purchaser, or his assigns, one or more patents for the tract or tracts of land therein described, signed by the governor and secretary of state, as other patents or deeds of land conveyed by the State, which shall vest in the purchaser all the right and title and interest of the State and of said college therein.

SEC. 2665. The principal of all money so collected must be paid to and held by the treasurer of state, and shall be drawn out only for the purpose of investment, upon the order of the board of trustees. The interest or rental collected must be paid at the end of each month to the treasurer of the college, and the agent collecting the same must at the same time file with the secretary of the board of trustees an itemized report of the amount collected.

SEC. 2666. The board shall manage and invest the endowment fund, which may be done in the bonds of the United States or this State or in some other safe bonds yielding not less than 5 per cent on the par value thereof; but the proposed investment shall be submitted to and approved by the executive council before being consummated.

SEC. 2667. It may loan said funds upon approved real estate security, subject to the following regulations: (1) Each loan shall be for a term not exceeding ten years, at a rate of interest to be fixed by said board, not less than 6 per cent per annum, payable annually; (2) each loan shall be secured by a mortgage paramount to all other liens upon improved farm lands in the State, the loan not to exceed 50 per cent of the cash value thereof, exclusive of buildings; (3) principal and interest shall be payable to the order of the board at the office of the State treasurer, the notes and mortgages to provide for the payment by the borrower of all expenses, attorney's fees, and costs incurred in collecting the same; (4) a register containing a complete abstract of each loan, and showing its actual condition, shall be kept by the secretary of said board, and be at all times open to inspection. The attorney-general, under the direction of the executive council, shall prepare the necessary blanks, forms, and instructions to carry into effect the provisions of this section and to keep such loans secure and unimpaired.

SEC. 2668. Subject to approval by the executive council, the board may appoint a financial agent to negotiate loans in accordance with the provisions of this chapter, and take charge of the foreclosure of mortgages and collections from delinquent debtors to said fund when so directed by it. Such agent shall hold his office during the pleasure of the board, and, before entering upon the discharge of his duties, take the oath required of civil officers, and give bond in a penal sum to be determined, and, with sureties, to be approved by said board, conditioned for the faithful performance of the duties of his agency and the payment into the State treasury of all funds which shall come into his hands in connection therewith. Such bond shall be in a sum at least double the amount of funds likely to come into his hands at any time, and be for the use and benefit of said college; and actions for breach of its conditions may be brought in the name of said board.

SEC. 2669. The financial agent shall receive a compensation, to be fixed by the board of trustees, not exceeding the sum of \$1,200 annually, and \$800 annually in addition for assistants and subagents and all necessary expenses connected with the discharge of his duties, to be paid as that of other officers out of the treasury of the State.

SEC. 2670. The foreclosure of any mortgage belonging to said college may be made in the name of the board of trustees, and in case of sale upon execution

under foreclosure, the premises may be bid off in the name of the college, and if a deed therefor is executed, the premises shall be held for the benefit of the college, and such lands shall be subject to lease or sale the same as its other lands.

SEC. 2671. Money collected from delinquents shall at once be paid into the State treasury, the principal of the fund to be there kept and drawn out for the purpose of investment as above provided, subject to such restrictions as may be imposed by the executive council. The State treasurer shall make monthly reports to the secretary of the board of trustees, showing all payments of principal and interest made, and remit to the treasurer of the college. All interest in his hands, as shown by such report, shall be loaned as other funds or used to defray the expenses of the college.

SEC. 2672. The board of trustees may appoint agents or do any other act necessary to carry out the provisions of the preceding sections where no such authority has already been given; but no agent shall be permitted to receive money until he has executed a bond in a sum double the amount he will be likely to receive, which bond, with the sureties, shall be approved by the board. Such agent shall make monthly itemized statements to the secretary of the board of the amount of money received by him, and at the same time transmit to the treasurer of the college all funds in his hands.

SEC. 2673. No person shall open, maintain, or conduct any shop or other place for the sale of wine, beer, or spirituous liquors, or sell the same at any place within a distance of 3 miles from the agricultural college and farm: *Provided*, That the same may be sold for sacramental, mechanical, medical, or culinary purposes; and any person violating the provisions of this section shall be punished, on conviction by any court of competent jurisdiction, by a fine not exceeding \$50 for each offense, or by imprisonment in the county jail for a term not exceeding thirty days, or by both such fine and imprisonment.

SEC. 2609. The general assembly shall elect the following regents and trustees of the State institutions, all of whom on any one board shall not be of the same political party. \* \* \* For the agricultural college, one trustee from each Congressional district who shall hold office for six years.

SEC. 2610. The term of each regent and trustee shall commence on the 1st day of May following the election; those holding for a term of six years shall be divided as nearly as may be into three equal classes, the terms of one class ending each two years; those for four years into two classes, the terms of one class ending each two years.

SEC. 2611. If the term of any regent or trustee now holding office expires prior to the 1st day of May in the even-numbered year, he shall hold until that time; terms of new regents or trustees shall commence on the expiration of the terms of the present incumbents ending on the 1st day of May of the even-numbered year.

SEC. 2612. Each regent, trustee, president, secretary, and treasurer of the university, and each State institution and all other officers thereof required to give bond, shall, before entering upon his duties, take the oath of office required of civil officers in the chapter upon qualifications for office, which shall be filed with the secretary of state or indorsed upon his bond.

SEC. 2613. Members of the general assembly shall be ineligible to the office of regent or trustee of any of the institutions of the State.

SEC. 2614. All requisitions upon the State treasurer for appropriations made for any State institution, unless otherwise provided, shall be presented quarterly on or after February 15, May 15, August 15, and November 15.

SEC. 2615. A majority of the regents or trustees shall constitute a quorum and may transact any business properly coming before them.

SEC. 2616. Each board of regents and trustees, when organized, may adopt such rules for its regulation and government and for the regulation and government of the institution in its charge, not inconsistent with law, as may seem just and proper.

SEC. 2617. Regents and trustees shall be allowed \$4 for each day actually and necessarily engaged in the performance of official duties, not exceeding thirty days in any one year, and mileage at the same rate as is allowed members of the general assembly. The limitation of thirty days shall not apply to building committees, which shall not consist of more than three members, but such committees shall not charge for or receive compensation for more than sixty days in any one year.

SEC. 2618. All claims of members of boards of trustees or of regents for attendance upon meetings of the board for time actually and necessarily spent in official duties shall be itemized, showing the date of such service and the nature thereof, and shall be sworn to by the claimant and certified to by the president and secre-

tary of the board. It shall then be filed with auditor of state, who shall compute the mileage due each claimant by the nearest traveled route from his home to the place of meeting, and shall enter said mileage upon the claim, and, if it be found in due form of law, the auditor shall draw his warrant upon the treasurer of state for the amount of said attendance and mileage. No compensation shall be allowed any members of such boards except as provided in this chapter.

SEC. 2619. The secretary of state shall, upon request, furnish proper blanks prepared in accordance with this chapter for the purpose of making claims by members of boards of trustees of State institutions for compensation.

SEC. 2620. The auditor shall include in his reports to the governor the amount paid for such services and mileage, and to whom paid.

SEC. 2497. The geological survey of the State shall be under the direction of the geological board, consisting of the governor, the auditor of the State, and the presidents of the agricultural college, the State university, and the Iowa Academy of Sciences.

SEC. 178. Any contingent fund set apart to any office or officer to be expended for the State shall, as used, be entered in a proper book showing when, to whom, and for what purpose it was devoted, and receipts shall be taken therefor, preserved, and filed with the report hereinafter required. On or before the 1st day of November preceding each regular session of the general assembly the officers or persons having charge of the fund shall make report to the State auditor in writing, showing in detail each item of expenditure made, and he shall not be credited with any sum not paid out in the manner contemplated by the law making the appropriation, nor unless the report shall be accompanied with the proper vouchers and receipts. All funds not thus accounted for may be recovered by the State from the proper officer or person, with 50 per cent damages thereon, and the State auditor shall, in his report to the governor, make a detailed statement of the condition of each appropriation contemplated by this section.

SEC. 179. Every person appointed or elected a regent, trustee, manager, commissioner, or inspector, or a member of any board of regents, trustees, managers, commissioners, or inspectors, now or hereafter created or provided by law for the government, control, management, or inspection of any public building, improvement, or institution whatever, owned, controlled, or managed, in whole or in part, by or under the authority or direction of this State, shall, before entering upon the discharge of his duties as such regent, trustee, manager, commissioner, or inspector, take and subscribe an oath, in substance and form as follows: "I, ———, do solemnly swear that I will support the Constitution of the United States and of the State of Iowa; that I will honestly and faithfully discharge the duties of [my office] according to the laws that now are, or that may hereafter be, in force regulating said institutions, and prescribing the duties of regents, trustees, managers, commissioners, or inspectors thereof (as the case may be); that I will in all things conform to the directions contained in said law or laws, and that I will not, directly or indirectly, as such regent, trustee, manager, or commissioner, or inspector (as the case may be), make or enter into, or consent to, any contract or agreement, expressed or implied, whereby any greater sum of money shall be expended or agreed to be expended than is expressly authorized by law at the date of such contract or agreement.

SEC. 180. Oaths required by this chapter shall be filed in the office of the auditor of state, and he shall not draw any warrant on the State treasury for expenditures made or directed by any such officer until such oaths are so filed.

Acts and resolutions of twenty-seventh general assembly, chapter 76 (1898): SECTION 1. That section 2646 of the code of Iowa be, and the same is hereby, amended by inserting between the word "trustees" and the word "but," in the second line of said section, the words "of which the governor and superintendent of public instruction shall be members by virtue of office."

SEC. 2. That section 2650 of the code of Iowa be, and the same is hereby, amended by striking out all of said section up to and including the word "year" in the fifth line of said section, and inserting therein in lieu thereof the following: "Annual meetings of the board of trustees shall be held at the college during the month of June of each year: the chairman may call special meetings when found expedient. The fiscal college year shall begin on the 1st day of July, and end on the 30th day of June of each year. (Approved March 28, 1898.)

Ibid., chapter 135: That there is hereby appropriated to the State College of Agriculture and Mechanic Arts, out of any moneys in the State treasury not otherwise appropriated, the sum of \$5,000, to be used for the purpose of building a carpenter shop on the grounds of the State College of Agriculture and Mechanic Arts, the same to be drawn from the State treasury on the certificate of the board of trustees of said college. (Approved April 6, 1898.)

Ibid., chapter 163: SECTION —. That the board of trustees of the State College of Agriculture and Mechanic Arts be, and are hereby, empowered to purchase not to exceed 40 acres of land adjoining the present college farm, and to pay therefor from the college endowment fund in accordance with the provisions of the original national grant.

SEC. —. When forty or more farmers of a county organize a farmers' county institute, with a president, secretary, treasurer, and an executive committee of not less than three outside of such officers, and hold an institute, remaining in session not less than two days in each year, which institute may be adjourned from time to time and place to place in said county, the county auditor, upon proof of such organization and such institute having been held, together with an itemized statement showing the manner in which the money herein appropriated has been expended, shall certify the same to the auditor of state, who shall remit to the treasurer of such county his warrant for not to exceed \$50, and there is hereby appropriated out of the moneys in the State treasury, not otherwise appropriated, a sum not to exceed \$50 annually for such institute work in each county. No officer of any such farmers' institute shall receive, directly or indirectly, any compensation from said State fund for services as such officer.

SEC. 1676. The money appropriated and paid into the county treasury shall be designated as a farmers' institute fund, and no warrant shall be drawn thereon, except by an order signed by a majority of the members of the executive committee. In case two or more organizations shall claim recognition as farmers' institutes in any county, a bill shall be audited by the board of supervisors, who shall divide said State fund as nearly as possible equitably, but in no case shall more than three institutes be held in one year in any county under the provisions of this chapter.

## KANSAS.

Constitution (1859): SEC. 188. Provision shall be made by law for the establishment at some eligible and central point of a State university for the promotion of literature and the arts and sciences, including a normal and an agricultural department. All funds arising from the sale or rents of lands granted by the United States to the State for the support of a State university, and all other grants, donations, or bequests, either by the State or by individuals for such purpose, shall remain a perpetual fund, to be called the "university fund," the interest of which shall be appropriated to the support of the State university.

SEC. 184. No religious sect or sects shall ever control any part of the common school or university funds of the State. [Probably this covers the fund of 1862, which was received by the State subsequently to the adoption of the constitution. The State university is mentioned under "Article VI—Education," and not under "Article VII—Public institutions."]

[The following matter is taken from the "General Statutes of Kansas, 1899, being a compilation of all the laws of a general nature, including the session laws of 1899, annotated to and including Kansas Reports, volume 59, and Kansas Appeal Reports, volume 7, by C. F. W. Dassel." Topeka, Kans., 1900.]

SEC. 6323. That the provisions of the act of Congress approved July 2, 1862, are hereby accepted by the State of Kansas; and the State hereby agrees and obligates itself to comply with all the provisions of said act.

SEC. 6324. That upon the approval of this act by the governor, he is hereby instructed to transmit a certified copy of the same to the Secretary of State and the Secretary of the Interior of the United States.

SEC. 6325. Whereas the Congress of the United States, by an act approved July 2, 1862, granted to the State of Kansas, upon certain conditions, 90,000 acres of public lands for the endowment, support, and maintenance of a college where the leading object shall be, without excluding other scientific and classical studies, and including military tactics, to teach such branches of learning as are related to agriculture and the mechanic arts, in order to promote the liberal and practical education of the industrial classes in the several pursuits and professions in life; and whereas the State of Kansas by its legislature has expressed its acceptance of the benefits of the said act of Congress, and has agreed to fulfill the conditions therein contained: Therefore be it enacted, etc.,

SEC. 6326. That the college in the foregoing preamble mentioned is hereby permanently located at and upon a certain tract of land situated in the county of Riley and bounded and described as follows: Commencing, etc., \* \* \* containing 100 acres: *Provided, however*, That the location of said college as aforesaid is upon this express condition: That the Bluemont Central College Association, in whom the title to said land is now vested, shall within six months from and after the

approval of the governor hereto, cede to the State of Kansas in fee simple the real estate above described, together with all buildings and appurtenances thereunto belonging, and shall within such time transfer and deliver to said State the apparatus and library belonging to said Bluemont Central College Association.

SEC. 6527. The governor of the State is hereby authorized to receive the title papers by which the foregoing mentioned property may be transferred to the State, and to cause the same to be duly recorded in the proper office, and to be deposited in the office of the auditor of State.

SEC. 6528. The college for the benefit of agriculture and the mechanic arts, which was located by an act of the legislature of the State of Kansas approved February 16, 1863, shall be known as the Kansas State Agricultural College.

SEC. 6529. The government of the college is vested in a board of seven regents, all of whom shall be appointed by the governor and confirmed by the senate, and whose term of office shall be four years. Five of said regents shall be appointed on or before the 1st day of April, 1897, one of whom shall hold his office until the 1st day of April, 1899, and four of whom shall hold their office until the 1st day of April, 1901. Two others shall be appointed on or before the 1st day of April, 1898, to hold office until the 1st day of April, 1899; and on or before the 1st day of April, 1899, and every four years thereafter, previous to the 1st day of April, three regents (and after the 1st day of April, 1897, four regents) shall be appointed by the governor and confirmed by the senate for a term of four years each, their terms expiring on the 1st of April. (Amended by an act passed in 1901 making the president of the college an ex officio member of the board of regents in place of one of the appointed members.)

SEC. 6530. No one connected with the college as professor, tutor, teacher, or employee shall be a regent.

SEC. 6531. The regents shall elect a president who shall be the chief officer of the college, the head of each department thereof, and secretary of the board of regents, and whose duties and powers, otherwise than as prescribed in this act, shall be prescribed by the board of regents.

SEC. 6532. The board of regents shall constitute the body corporate with the right as such to sue and be sued, to use a common seal and alter the same at pleasure.

[In connection with this section may be quoted the remarks of the Kansas supreme court: "They [the board] are a corporation having the entire control of all departments of the college—educational, financial, and administrative. They have the power to appoint and discharge the president and all the professors and teachers, and to fix and increase or diminish their several salaries. But with all these powers, they are not supreme nor irresponsible. They may 'sue and be sued,' just as the managing officers of other public corporations, such as cities, towns, counties, townships, and school districts may. \* \* \* While the legislature unquestionably intended to confer upon the board of regents extensive powers, yet it did not intend to confer upon them the irresponsible power of trifling with other men's rights with impunity; and making the regents responsible for their acts does not in the least abridge their powers. It only tends to make them more cautious and circumspect in the exercise of their powers. But the plaintiff in error [i. e., the board of regents] claims in substance that the board has no legal power to make a contract to employ a president or a professor or a teacher for any particular period of time and therefore that an agreement to employ a president or a professor or a teacher for three months or for any other definite period of time would be an absolute nullity. Now we can not think that this is correct. We think that the board has the power to make a valid contract in advance, \* \* \* and especially so where the board reserves the right to discharge such president, professor, or teacher at any time for misconduct. It would certainly be for the interest of the college that the board should have such power. No man of spirit, of self-respect, and of capability would want to hold an office or position at the whim or caprice of a body of men with whom he might have but little if any personal acquaintance. No man of spirit, of self-respect, and of capability would accept an office unless he felt that he was reasonably certain to hold the same for some reasonable period of time, \* \* \* and generally men only of inferior talent could be found to accept it or to perform its functions with such a precarious tenure, and even then a higher rate of compensation would be required than where the tenure is more stable and certain." (The Board of Regents of the Kansas State Agricultural College v. Mudge, 21 Kans., pp. 929-930.)]

SEC. 6533. The regents shall have power to enact ordinances, by-laws, and regulations for the government of said college, to elect a president, to fix, increase, and diminish the regular number of professors and teachers, and to appoint the same, and to determine the amount of their salaries. They shall have power to remove the president and any professor or teacher whenever the interest of the college shall require.

SEC. 6534. The college shall consist of four departments: (1) The department of agriculture, (2) mechanic arts, (3) military science and tactics, (4) literature and science.

SEC. 6535. The immediate government of the several departments shall be intrusted to the president and the respective professors and teachers, but the regents shall have power to regulate the course of instruction and to prescribe, under the advice of the faculty, the books and authorities to be used in the several

departments; also to confer such degrees and grant such diplomas as are conferred by institutions of the highest grade.

SEC. 6536. The college shall be open to all persons, under such regulations as may be prescribed by the regents: *Provided*, That no student shall be refused admittance to this college simply because he has been expelled from some other college.

SEC. 6537. The board of regents shall make an exhibit of the affairs of the college in each year to the superintendent of public instruction, setting forth the condition of the college, the amount of receipts and expenditures, the number of professors and teachers and other officers, and the compensation of each; the number of students in the several departments and in the different classes, the books of instruction used, an estimate of the expenses of the ensuing year, a full transcript of the journal of the proceedings for the year, together with such other information and suggestions as they may deem important or the superintendent of public instruction may require to embrace in his report, which shall be reported by the superintendent of public instruction to the legislature in his annual report.

SEC. 6538. The board of regents shall report annually the progress of said college, recording any improvements and experiments made, with their cost and results, and such other matters, including State and industrial and economical statistics, as may be supposed useful; one copy of which shall be transmitted by mail, free, to all the other colleges which may be endowed under the provisions of the act of Congress approved July 2, 1862, and also one copy to the Secretary of the Interior.

SEC. 6539. A board of visitors to consist of three persons shall be appointed by the governor, to hold their offices severally for one, two, or three years, but their successors shall hold their office for three years. It shall be their duty to make a personal examination into the state and condition of the college in all its departments and branches once at least in each year, and report the result to the superintendent of public instruction, suggesting such improvements as they may deem important, which report shall be embodied in the report of the superintendent.

SEC. 6540. The regents shall have power to appoint a secretary, librarian, treasurer, and such other officers as the interests of the college may require, who shall hold their office at the pleasure of the board and shall receive such compensation as the board may prescribe.

SEC. 6541. The board of regents shall have the general supervision of the college and the direction and control of all expenditures.

SEC. 6542. It shall be the duty of the board of regents at their earliest convenience to secure a collection of specimens in mineralogy, geology, zoology, botany, and other specimens pertaining to natural history, and whenever a geological survey of the State may be made a complete set of specimens collected shall be deposited in the cabinet of the college. The said board shall make provision for increasing and preserving the library and apparatus belonging to the said college, and the apparatus and library that may be transferred to the State by the Blue-mont Central College Association.

SEC. 6543. The first meeting of the board of regents shall be called by the superintendent of public instruction as soon as may be after the fulfillment by the Blue-mont Central College Association of an act entitled "An act to locate and establish a college for the benefit of agriculture and the mechanic arts," approved February 16, 1863; but all succeeding meetings shall be called in such manner as the said board may prescribe, and shall be held at the college building and at least once annually.

SEC. 6544. A majority of the board of regents shall constitute a quorum to do business.

SEC. 6545. The 90,000 acres of land granted to the State of Kansas by Congress to endow a college for the benefit of agriculture and the mechanic arts shall be used solely for the endowment of said Kansas State Agricultural College and for no other purpose whatever, and the interest on the fund arising from the sale of said lands shall be used as the board of regents may determine for maintenance, support, and development of the said agricultural college; but the principal or the money arising from the sale of said lands shall be invested according to law.

[In a case known as Board of Regents of the Kansas State Agricultural College v. Hamilton, treasurer of Saline County (28 Kans.), the court said: "The controlling question in matters of taxation is who in fact owns the property and not where rests the mere legal title. . . . The question then is who really and equitably owned this land? Unhesitatingly we affirm the State. The Kansas State Agricultural College is a State institution; it is absolutely and exclusively under the control of the State; its property belongs to the State. It is true that to-day the State has created the board of regents into a body corporate, but to-morrow it may set aside this body corporate and place the control of the properties in any other board or organization. No private rights intervene. It is purely and solely a matter of State and public control. The State

created a body corporate, but why we can not say. In regard to certain State institutions, why it did the same—as, for instance, in the case of the State University, why it omitted to do so in the case of the normal school, in the case of the State penitentiary—we do not know. . . . It is enough for the purposes of this case to know that the State is the absolute owner and controller of the institution and its properties, and the mere manner in which it executes the trusts reposed in it by the act of Congress or disposes of the public property vested in it, is for the purposes of this case entirely immaterial. . . . This agricultural college is . . . a mere instrument created directly by the State and is the one by which it manages the properties conveyed to it by the United States. . . . Therefore our conclusion is that this real estate belonging absolutely to the agricultural college . . . is exempt from taxation" (pp. 379-380).<sup>a</sup>

[In a case of 1875, *Oswalt v. Hallowell*, treasurer of Washington County, the court said: "But do the laws of Kansas make this kind of land (i. e., agricultural land held under contracts purchase) held in this manner taxable? Now there can be no question as to the power of the State to tax all land within its borders not belonging to the United States or to Indians, even though the State may own the land itself. The only question, then, is whether the State has attempted to make these lands taxable. The first section of the tax law provides that 'all property in this State, real and personal, not expressly exempted therefrom shall be subject to taxation.' Now, are these laws [lands?] expressly exempted from taxation? We think not. . . . The land in question is not 'used exclusively for State purposes'. . . . and it does not belong to the State exclusively" (15 Kans., p. 156-157). The court adhered to this in 29 Kans., *Board of Commissioners v. Baldwin*. In *Stahl, Treasurer of Lyon County, v. Kansas Educational Association of the Methodist Episcopal Church* (1895), it was held that private corporation is liable to be taxed "when its real estate is rented to a tenant or its funds invested in other property for profit or loaned at interest" (p. 549, 54 Kans.).]

SEC. 6546. The board of regents of the State Agricultural College are hereby authorized and directed to sell as soon as practicable and in the manner hereinafter provided the public lands granted by act of Congress approved July 2, 1862, to the State of Kansas, for the benefit of agriculture and the mechanic arts.

SEC. 6547. The said board of regents shall sell any portion of lands mentioned in the preceding section at a price not less than \$3 per acre, for cash at the time of sale or upon the following conditions of credit, when deemed by them most conducive to the interests of said college, to wit: In eight equal annual installments, with 10 per cent interest on each installment, payable annually, the first installment to be paid at the date of purchase. The said board of regents are hereby authorized and directed to employ an agent or agents to sell said lands, and his rate of compensation with other expenses of sale shall not exceed 3 per cent upon the amount received from the sale of said lands, and he shall also have power to execute to the purchaser in the name of the State of Kansas all receipts for purchase money and title bonds necessary to be given in the sale of said lands: *Provided*, That on all timbered lands half of the purchase money shall be paid in advance, and also that a purchaser may at any time pay all arrearages and receive his patent: *Provided, however*, That all expenses of management and superintendence of said lands and all the expenses attending the sale thereof and the investment of the proceeds which may be received therefrom shall be paid by the State, and the auditor of State is hereby authorized to audit all expenses provided for in this act.

SEC. 6548. That the board of regents of the Kansas State Agricultural College is hereby authorized, in view of the fact that all the lands granted for endowment of said college have been sold, to empower the secretary of said board of regents to execute new contracts, subject to approval by said board of regents, for any lands returned upon forfeiture of contract, without the appointment of a land agent as provided by law, and the officer so empowered shall be required to make the settlements and statements required of the land agent by law.

SEC. 6550. The said agent or agents shall, before he or they enter upon the duties of the office, execute to the State of Kansas a bond in the sum of \$40,000; said bond to be approved by the governor and filed in the office of the secretary of state.

SEC. 6551. The president and secretary of the board of regents or their agents, shall give receipts to the purchaser of said lands for the payment of all installments and interest due thereon; and when the last installment upon any one purchase has been paid, the purchaser, his heirs or assigns, shall be entitled to a patent for the land so purchased, from the governor, under the great seal of the State, which patent shall confer upon the grantee a title in fee simple for the lands described in said patent.

SEC. 6552. The treasurer of the said agricultural college shall, before he receives from the board of regents the order for the funds in the hands of the State treasurer, execute and give a bond with five or more securities, to be approved by the board of regents, in double the amount of the funds of the said agricultural college, as near as the same can be ascertained, which will come into his hands as treasurer during his term of office, payable to the Kansas State Agricultural College, and con-

<sup>a</sup>The constitution of Kansas (art. 11) provides that the legislature shall provide for a uniform and equal rate of assessment and taxation, but all property used exclusively for State, county, municipal, literary, educational, scientific, religious, benevolent, and charitable purposes, and personal property to the amount of at least \$200 for each family shall be exempted from taxation.

ditioned for the faithful discharge of his duties as treasurer of the said college. He shall keep an accurate account in a book kept for that purpose of all moneys, notes, bonds, or other evidences of indebtedness coming into his hands as treasurer, and shall keep a separate account of the endowment and interest funds; he shall pay out no moneys except upon the order of the board of regents or the loan commissioner.

SEC. 6553. The board of regents may, if they deem it for the interest of said agricultural college, direct the treasurer to sell or dispose of any or all bonds or other evidences of indebtedness belonging to the said college, on such terms as they may prescribe, and the land commissioner shall, under their direction, reinvest the proceeds as provided by this act.

SEC. 6554. Any person failing to pay the purchase money for any of the lands purchased from the Kansas State Agricultural College, or any installment of the same, shall forfeit all right to the land from the time of such failure of payment, and the board of regents shall proceed to eject such person from said land, if in possession.

SEC. 6555. The governor, treasurer, and secretary of the State of Kansas are hereby authorized and directed to issue, on or before the 1st day of April, 1866, the bonds of the State of Kansas for the sum of \$5,500, the same to be negotiated by the governor, and the proceeds to be paid into the State treasury; said bonds, with coupons attached, shall run five years from their date, bearing interest at the rate of 10 per cent per annum, payable semiannually at the office of the treasurer of State, and shall not be sold below their par value.

SEC. 6556. The proceeds of the sale of said bonds shall be applied as follows, to wit: The sum of \$5,500 to pay arrearages incurred in conducting the Kansas State Agricultural College, and to defray the current expenses of said college for the year 1866, and the auditor of State is hereby authorized to draw his warrant on the State treasurer in favor of the treasurer of the board of regents upon an order of said board.

SEC. 6557. The amount to be applied out of the income referred to in section 5 of this act, to meet the current expenses of said college, shall not exceed \$4,000 per annum as long as the principal and interest on said bonds herein provided to be issued remains unpaid; and all moneys realized from the accruing interest on said deferred payments and securities over \$4,000 per annum shall be by the State treasurer applied in liquidation of said bonds, on the 1st day of January of each year, until the whole of said loan secured by the bonds herein provided shall have been paid: *Provided, however*, That if a sufficient fund is raised from the sale of said lands as will afford a surplus income after paying the bonds herein provided to be issued, and interest thereon as the same becomes due, a larger sum to defray the current expenses of said college may be appropriated, if the board of regents in their judgment may deem it necessary.

SEC. 6558. The treasurer of the board of regents shall audit all accounts of said agent or agents for the sale of said lands and all other accounts against said college, and the auditor of state shall audit all the accounts of said treasurer of said board of regents relating to said lands, and the sale thereof, and to the current expenses of said college.

SEC. 6559. All moneys, bonds, mortgages, promissory notes, or other evidences of indebtedness due or belonging to the endowment fund of the State Agricultural College now in the hands of the treasurer, loan agent, or land agent of said State Agricultural College are hereby ordered turned over to the treasurer of the State of Kansas on or before April 1, 1883. The officer or officers delivering such securities shall take receipts therefor in triplicate. One of said receipts shall be filed with the auditor of state, one with the board of regents, and one to be retained by the officer making such payment. The treasurer of state shall be responsible on his official bond for all sums of money, securities, bonds, or other valuable things which may come into his hands by virtue of this act, and shall at the close of each month make to the secretary of the board of regents a detailed statement of collections and disbursements and the condition of such funds belonging to said college.

SEC. 6560. The board of regents shall appoint a loan commissioner, whose duty it shall be to make investments of the funds belonging to the said Agricultural College. The board of regents shall adopt rules and regulations under the provisions of this act, prescribing the kind and manner in which all bonds and investments shall be made by said loan commissioner. He shall keep an accurate account in a book kept for that purpose of all loans and investments. He shall draw his warrant upon the treasurer of state for such sums as he may loan or invest, specifying in the warrant to whom the same is payable. The president of the college and secretary of the board of regents of the Agricultural

College shall approve all loans and investments made, and with the loan commissioner shall sign all warrants issued on the State treasurer. The loan commissioner shall draw no warrant except for loans and investments, and separate warrants shall be drawn for each loan or investment. All loans or investments shall be made in the name of the Kansas State Agricultural College, and all principal and interest shall be payable at the office of the State treasurer.

SEC. 6561. The interest accruing on the investment of the State Agricultural College funds and the interest paid upon sales of Agricultural College lands shall be paid over to the treasurer of the State Agricultural College by the State treasurer upon the warrant of the president of the board of regents, attested by the secretary.

SEC. 6562. The agent for the sale of State Agricultural College lands shall, on or before the 5th day of each month, pay over to the State treasurer all money received by him on account of sales of said lands or collections on prior sales for the month preceding. At the time of making such payment said land agent shall deliver to the auditor of state, and also to the secretary of the board of regents, a detailed statement, duly certified under his hand, showing the number of acres and descriptions of the lands sold, by whom purchased, and the price per acre, and all collections on prior sales for the months upon which payments are made to the State treasurer.

### KENTUCKY.

Constitution (1891): SEC. 184. No sum shall be raised or collected for education other than in common schools until the question of taxation is submitted to the legal voters and the majority of the votes cast at said election shall be in favor of such taxation: *Provided*, The tax now imposed for educational purposes, and for the endowment and maintenance of the Agricultural and Mechanical College, shall remain until changed by law.

SEC. 189. No portion of any fund or tax now existing, or that may hereafter be raised or levied for educational purposes, shall be appropriated to or used by or in aid of any church, sectarian or denominational school.

[In the cases *Higgins v. Prater*, sheriff, and *Hill v. Hamilton*, sheriff (91 Ky.), the Kentucky court of appeals said: "The question presented in these cases is not only an important but a delicate one. Delicate because we must determine whether a legislative act is constitutional and important, because it relates to education, which has been said to be the birthright of every child born in a republic. Its consideration has been delayed because of repeated legislative agitation upon the subject; but as a convention is now in session, framing a proposed organic law for the State, it is proper that it should be decided. Our legislature in 1880 passed a statute imposing a tax of one-half a cent on each \$100 in value of taxable property in the State for that year, and for each subsequent year, for the benefit of the Agricultural and Mechanical College of Kentucky, which is an educational institution incorporated by the law of the State, and under its control. The tax is a small one. The owner of \$10,000 worth of property pays but 50 cents a year. If unconstitutional, however, then it is oppressive, however small. If the college can fairly be considered a part of our common-school system, then this is an end of the controversy. It is unsectarian in character. Its design is to furnish at a cheap rate of tuition a practical and liberal education to the rich and poor alike. \* \* \* It has a normal department and is subject to the control of the State board of trustees. Each legislative district of the State can send one student per year, who may take the entire collegiate course free of charge for tuition, and it may in like manner send for one year not more than four persons, in the discretion of the board of control, who are or intend to be teachers. Notwithstanding all this, however, we think it clear, in the light of the proceedings of the convention which framed our constitution, and legislation prior and subsequent thereto, as well as from the opinions of this court in the case of *Hallbert v. Sparks*, 9 Bush, (72 Ky., p. 263), and *Collins v. Henderson*, etc., 11 Bush, (74 Ky., defining what was meant by 'common schools'), that this institution cannot be regarded as a part of our common-school system. In fact, this is virtually conceded in argument; and this brings us to the consideration of the highly important question, which is, *res integra*, whether the legislature can constitutionally aid by taxation any educational institution whatever, other than common schools. It is plain that it is not expressly forbidden by the article of the constitution above cited.

"An implied prohibition is, however, claimed. \* \* \* It is urged that \* \* \* the organic law has confined the use of any money raised by taxation to the support of common schools. In determining this question this court can not consider whether the result may cripple rival institutions or possibly affect the future prosperity of our common-school system. These are matters of expediency that address themselves to the lawmaker and not to the courts. \* \* \* [Now] does the constitution impliedly forbid the raising of any public money by taxation for any educational purposes, save the general common-school fund of the State? Common-school education is the subject of the article. No other sort of education is named. The original of the school fund named in the constitution came from the General Government. In 1830 it distributed among the States a large surplus of money, this State's portion being nearly \$1,500,000. It should, perhaps, in view of the understanding with which the donation was made, have set apart the entire sum for the support of a general system of education. It did so, however, in 1837 to the extent of \$1,000,000. In 1838 the legislature reduced the sum to \$850,000, for which sum State bonds, bearing interest payable semiannually, were issued to the board of education. Those in authority regarded this as a debt due by the State to itself, therefore the payment of interest was neglected, to which default the legislature by its action was a party. The money thus donated to the State was in the main used in the construction of internal improvements. In 1845 the legislature directed the board of education to surrender the bonds that had been executed to it to the governor, with directions that he burn them, lists thereof being kept, and this was done. The friends of common-school education became alarmed. In 1848 the legislature

passed an act which recognized the sacredness of the original debt, directed the execution of a bond to the board of education for its unpaid interest, amounting then to nearly \$300,000, but made it payable at the pleasure of the legislature, and ordered a vote of the people as to whether a tax of 2 cents on the \$100 of taxable property should be levied 'for the purpose of establishing more permanently a common-school system in the State.' It carried by a very large majority. The convention that framed our present constitution (that of 1850) met the following year.

"The public mind was still excited in regard to the then recent invasion of the common-school fund. This was the mischief to be remedied, and it was to be done by placing the bond beyond the caprice of future legislatures. It then existed only by legislative sufferance, as neither of the first two constitutions of the State contained any provision as to education. Prior to 1849, we do not think, in the light of all historical information at hand, it can fairly be said there was any conflict between the friends of higher and lower education. If so, it is likely it would have been carried into the convention of that year, and there is no trace of it. The debates in that body show that this was not the question before it. It was never named. This silence is significant in the consideration of this case. The purpose was, in the language of one of the leading members of the convention, 'to place the common-school fund beyond legislative control.' Some favored a future tax for it by constitutional guarantee, while others, although in favor of making the fund inviolate, desired to leave future taxation to the legislature. This was the main ground of difference. The last view prevailed \* \* \* and the members generally used the terms 'educational purposes' and 'common-school purposes' as synonymous terms. Hence, the court decided that the constitution of 1850 was merely confining money raised by taxation for common schools to the support of common schools, but was not interdicting the legislature from laying taxes for higher education. In 14 Bush. (77 Ky.) it was decided, in *Auditor (of State) v. Kalland, etc.* (p. 133), that 'The general assembly has no power thus to abdicate its control over the fund (common school) and abandon to the county courts, to be performed or not at their pleasure, the duty and power which the constitution has imposed upon and vested alone in the legislature.'"]

SEC. 170. There shall be exempt from taxation public property used for public purposes; places actually used for religious worship, with the grounds attached thereto and used and appurtenant to the house of worship, not exceeding one-half acre in cities or towns and not exceeding 2 acres in the country; places of burial not held for private or corporate profit, institutions of purely public charity, and institutions of education not used or employed for gain by any person or corporation, and the income of which is devoted solely to the cause of education; public libraries, their endowments, and the income of such property as is used exclusively for their maintenance; all parsonages or residences owned by any religious society and occupied as a home, and for no other purpose, by the minister of any religion, with not exceeding one-half acre of ground in towns and cities and 2 acres of ground in the country appurtenant thereto.

[The following matter is taken from "The Kentucky Statutes, containing all general laws, 2d ed., prepared by John D. Carroll." Louisville, 1893.]

Kentucky Statutes: SEC. 15. The government, administration, and control of the Agricultural and Mechanical College of Kentucky is hereby vested in a board of trustees, constituted and appointed as follows: (1) His excellency the governor of Kentucky, who shall be ex officio chairman thereof: (2) fifteen men, discreet, intelligent, and prudent, who shall be nominated by the governor of Kentucky, by and with the advice and consent of the senate. They shall hold office for six years, five retiring and five being appointed at each regular session of the general assembly. Said nominations shall be made within fifteen days after the legislature convenes. Said trustees shall be appointed and distributed as follows, namely, one from each Congressional district outside of the Congressional district in which Lexington is situated, and the remainder from the latter district: but no more than three trustees shall be appointed from the county of Fayette: *Provided*, That no trustee now serving under an appointment previously made shall be displaced by the operation of this act before his term of service shall expire: (3) the president of the college shall be ex officio a member of the board of trustees.

SEC. 16. The board of trustees, when appointed and qualified, shall be a body corporate, under the corporate name of the Agricultural and Mechanical College of Kentucky, and as a corporation shall have power to sue and be sued, implead and be impleaded, contract and be contracted with, and possess all the immunities, rights, privileges, and franchises usually attaching to the governing bodies of educational institutions. They shall have power to receive, hold, and administer, on behalf of the institution whose government, administration, and control is committed to them, all revenues accruing from all existing or future endowments, appropriations, or bequests, by whomsoever made, subject to the conditions attaching thereto; to receive, administer, and apply, for and on behalf of said college, all moneys, devises, stocks, bonds, buildings, museums, lands, apparatus, etc., under the conditions attaching thereto. Said trustees shall have power to determine, from time to time, the number of departments of study or investigation which the college shall comprise within the scope of the organic act of Congress, or acts supplementary thereto, donating land scrip for the endowment of agricultural and mechanical colleges: the relation which each department or group of departments shall sustain to each other and to the whole; to

devise, allot, and arrange the distributions of departments or groups of departments, with the designation appropriate to each; and to devise the means required for their effective instruction, administration, and government. They shall have also power to appoint presidents, professors, assistants, tutors, and other officers, and to determine the salaries, duties, and official relations of each; and shall provide for a definite salary in money attached to all positions created and filled by the board of trustees; and there shall be no additions thereto in the form of fees, perquisites, or emoluments of any kind whatever. They shall have full power to suspend or remove at will any of the officers, teachers, professors, or agents whom they are authorized by law to appoint, and to do all other acts which may be needful for the welfare of the institution.

SEC. 17. Said board of trustees shall have power to grant degrees to the alumni of the institution, to prescribe conditions upon which post-graduate honors shall be obtained by its alumni and others, and to confer such honorary degrees upon the recommendation of the faculty of the institution as they may think proper.

SEC. 18. A majority of the whole board shall constitute a quorum for the transaction of business.

SEC. 19. In the appointment of presidents, professors, or instructors no preference shall be shown to any religious denomination.

SEC. 20. The board of trustees shall meet in Lexington twice each year in the president's room in the college, namely, upon the Tuesday preceding the annual commencement and upon the second Tuesday in December. In the absence of the governor the board shall have the power to appoint a chairman *pro tempore*. They shall elect annually a secretary, who shall keep a record of their proceedings, and a treasurer, who shall receive and disburse the funds, and a business agent, who shall make all purchases for all departments of the college and attend to all the business under the direction of the board. Said secretary and treasurer and business agent shall receive for their services a fair compensation, but the treasurer elected under the provisions of this act shall not be a member of the board of trustees or of the faculty of the college, or otherwise an employee of the college or of any of the departments thereof. They shall at each regular meeting appoint an executive committee, consisting of five of their number residing in or near Lexington, including a chairman thereof, three of whom shall constitute a quorum, and said committee shall choose from their number a chairman *pro tempore*, to act in the absence of the permanent chairman. The executive committee shall be charged with the general administration of the affairs of the college, under such by-laws and regulations as shall be prescribed by the board of trustees, and with the execution of measures specially authorized by the board. It shall, at each regular meeting of the trustees, and at each called meeting, if required, submit to the board a complete record of its proceedings for the consideration and approval of the board of trustees: *Provided*, That the authority of the board of trustees to revise the acts of the executive committee shall not extend to the general or specific authority granted by the board of trustees, and within the sums appropriated by the board for the specific or contingent objects at regular or called meetings. The secretary of the board of trustees shall also be secretary of the executive committee and the custodian of the records, and so forth, of the board and said committee.

SEC. 21. The treasurer of said college shall enter into covenant with the Commonwealth of Kentucky, with one or more good sureties bound therein, to be approved by the board of trustees, conditioned for the faithful performance of his duties and the payment of all moneys that shall come to his hands to his successors in office or to such person or persons as may be lawfully entitled to receive the same. Any person or persons, including the board of trustees, injured by any breach of this bond may maintain in the Fayette circuit court appropriate action thereon. The said treasurer shall keep an itemized account of receipts and expenditures and shall pay out no money except on authorization of the board of trustees, given directly or through its executive committee. He shall render to the executive committee monthly statements of receipts and expenditures and amount on hand, and a full detailed statement, with vouchers, for the information and action of the board of trustees at its regular annual meeting and at other periods when required.

SEC. 22. In the case of the death, resignation, or refusal to serve of any of the trustees appointed as members of the board on behalf of the State the remaining trustees shall, at their first meeting thereafter, have power to fill all vacancies occasioned by such death, resignation, or refusal to serve, and the person or persons so appointed shall hold their office as trustees during the natural or unexpired terms of the person or persons for whom they are substituted and appointed.

Any trustee who shall fail to attend two consecutive meetings, without proper notification to the secretary of the reason therefor, shall thereby vacate his office of trustee, and the board shall fill the vacancy as hereinbefore provided for.

SEC. 23. All necessary expenses incurred by the trustees in going to, returning from, or while attending the meetings of the board shall be met and discharged out of the funds of the institution.

SEC. 24. That in addition to the regular meetings, called meetings of the board of trustees may also be held. The call for such meeting must be in writing, signed by three or more trustees. The call must also be formally communicated by the secretary to each trustee by mail, at his post-office address, at least fifteen days before the day fixed for the meeting, and must state definitely the object of the meeting; and no business not thus explicitly announced shall be acted on at the called meeting.

SEC. 25. That the regular collegiate period of the agricultural and mechanical college shall be four years, and only those students who pass through that period and attain the prescribed standard of proficiency in the regular course of studies, or those who have qualified themselves elsewhere, shall be found, after at least one year's attendance in the college, to have attained the prescribed standard of proficiency in the regular course of studies shall receive a diploma from the college. But a normal department or course of instruction for irregular periods, designed more particularly, but not exclusively, to qualify teachers for common or other schools, and an academy or preparatory department to prepare students for the regular courses of study in the college shall be established and maintained in connection with the college, each under a competent principal and assistants, and under the general supervision and control of the faculty thereof.

SEC. 26. The board of trustees are hereby empowered to establish proper regulations for the government of the college and the physical training, military or otherwise, of the students, and to authorize the suspension and dismissal of students for neglect or violation of the regulations, or for other conduct prejudicial to the character and welfare of the institution.

SEC. 27. The board of trustees shall make to the general assembly, within the first month of each regular session, a full report of the condition and operation of the college since the date of the preceding report, with such recommendations concerning the college as may be deemed necessary.

SEC. 28. Each legislative district in the State shall, in consideration of the incomes accruing to the college under "An act for the benefit of the Agricultural and Mechanical College of Kentucky," approved April 29, 1880, be entitled to select and to send to said college each year one properly prepared student, free from all charges for tuition, matriculation fees, room rent, fuel and lights, and to have all the advantages and privileges of the college and dormitories free, except board. Students shall be entitled, free of any cost whatever, to the benefits enumerated above for the term of years necessary to complete the course of study in which he or she matriculates for graduation, or during good behavior. All beneficiaries of the State who continue students for one consecutive collegiate year, or ten months, unless unavoidably prevented, shall also be entitled to their necessary traveling expenses in going to and returning from said college. The selection of the beneficiaries shall be made by the superintendents of common schools in their respective counties, upon competitive examination on subjects prepared by the faculty of the college and transmitted to said superintendents before the 1st day of June of each year: *Provided*, That no standard of admission adopted by the college for admission into the academy shall exclude from the benefits of this act county appointees who have completed the course of study prescribed by law for the common schools of the Commonwealth. Said competitive examination shall be open to all persons between the ages of 14 and 21 years. Preference shall be given, other things being equal, to those who have passed with credit through the public school, persons of energy and industry whose means are small, to aid whom in obtaining a good education this provision is intended. If any representative district contains more than one county, each county so included shall be entitled to select one beneficiary as aforesaid. Said competitive examination shall be held and the successful competitor appointed between the 1st day of June and the 1st day of August of each year. It shall be the duty of the county superintendent to make known the benefits of this provision to each common school district under his superintendency, with the time and place, when and where such competitive examination shall be held. He shall for this purpose appoint a board of examiners whose duty it shall be to conduct the examination.

SEC. 29. In addition to the foregoing, teachers, or persons preparing to teach, may be admitted at the rate of not more than four from each county, upon the same conditions, receive the same benefits, and have the same privileges in said

college as prescribed in the preceding section. The appointments shall be vested in the county superintendents. Said appointments may be made and certified to the president of the college at any time between the 1st day of July and the 31st day of December of each year.

SEC. 30. The president shall, on or before the 1st day of July of each year, have printed and mailed to each county superintendent of common schools of this State at least as many circulars of information relative to said college as there are common school districts in said respective counties. Said circulars shall set forth in full the benefits of, methods of admission into, and the probable cost to beneficiaries of said college. The county superintendents of common schools shall have at least one of said circulars posted in the schoolhouse of each common school district in their respective counties during the term of the free school thereof.

SEC. 2735. (1) The geological collection, including maps, charts, apparatus, and all the accumulated material of the geological survey, is hereby directed to be removed to the building of the State college, to be placed in rooms suitable for that purpose, there to remain, subject, however, to be recalled at any time that may seem proper by the general assembly.

(2) The present inspector of mines shall keep an office at the State college, and the salary of himself and each assistant, including his salary as curator of the geological survey, as provided by law, shall continue during the term of service for which he and they were appointed.

(3) The board of trustees of the State college are hereby authorized to establish a course of study in said college to be known and designated as the "course of mining engineering," in which shall be taught all the branches of science relating thereto, and said board of trustees shall, after the expiration of the terms of service of the present inspector and assistants, respectively, select, as other professors are selected, a suitable and competent person for dean of the same, with the necessary staff of assistants, and said dean shall, by reason of said selection, be the inspector of mines, with all the powers and privileges now conferred upon the said inspector by law. It shall also be his duty to determine, by chemical analysis or otherwise, the kind and quantity of the mineral products of the State of Kentucky as may be sent to him for inspection or analysis, and give written opinions thereon; but these latter duties shall not be allowed to interfere with his duties as inspector, relative to the safe condition of the coal mines of the State. He shall take the required oath and give the same bond as now required by same officer. He and his assistants shall hold office on identically the same conditions with other professors in said college, and shall be subject to removal as they are. Said dean and his assistants, however, inasmuch as their duties consist primarily and principally of work peculiarly public and practical in relation to the mines and mineral products of the Commonwealth, shall be regarded as public servants in a sense in which the ordinary professors of the college can not be regarded, and shall therefore receive compensation directly from the State and not from the funds of the college, and their compensation as now fixed by law shall be certified to the auditor as heretofore and paid out of the treasury as now paid.

(4) The inspector of mines is hereby directed to remove within a reasonable time the geological collection of this State, including maps, apparatus, etc., to the State college at Lexington.

SEC. 1822. In each year, before any person or company shall sell, offer, or expose for sale in this State any commercial fertilizer, said person or company shall furnish to the director of the agricultural experiment station of the Agricultural and Mechanical College of Kentucky, which station is hereby recognized as the "Kentucky Agricultural Experiment Station," a sealed quantity of such commercial fertilizer, not less than 1 pound, sufficient for analysis, accompanied by an affidavit that the sample so furnished is a fair and true sample of a commercial fertilizer which the said person or company desires to sell in this State, and said affidavit shall also state the name and address of the manufacturers, the name of the fertilizer, the number of net pounds in each package, and the minimum percentages of the essential ingredients guaranteed in each fertilizer, in such form and manner as may be prescribed by said director.

(2) The director of said experiment station, upon receipt of affidavit and sample, as provided for in section 1, and upon receipt of the fees hereinafter provided, shall issue to said person or company a sufficient number of labels to tag not less than 20 tons of said fertilizer, on which label shall be printed the name and address of the manufacturer, the name of the fertilizer, the number of net pounds in each package, and the minimum percentage composition in terms approved by the said director, as certified to in affidavit furnished by said person or company, together with a certificate from the director over his facsimile signature, authorizing the sale of such packages, according to the provisions of this act.

(3) Every bag or other package or quantity of any commercial fertilizer, in any shape or form whatever, sold or offered for sale in this State, shall have attached to it in a conspicuous place a label as provided in section 2.

(4) Any manufacturer or vender of any commercial fertilizer, or any person or company who shall sell, offer, or expose for sale any fertilizer, without having previously complied with the provisions of this act, shall be fined not less than \$100 nor more than \$500 for each violation or evasion of this act.

(5) The director shall receive for the labels described in section 2 of this act 50 cents for such number as may be required for 1 ton of fertilizer: *Provided*, That he may not furnish at any one time a less quantity than is sufficient for 10 tons of fertilizer.

(6) The director of said Kentucky Agricultural Experiment Station shall pay all such fees received by him into the treasury of the Kentucky Agricultural Experiment Station, the authorities of which shall expend the same in meeting the legitimate expenses of the station, and for inspecting and making analyses of fertilizers, in experimental tests of same, and in other experimental work and purchases as shall inure to the benefit of the farmers of this Commonwealth. The director shall, within two months of the biennial meeting of the general assembly, present to the commissioner of agriculture a report of the work done by him, together with an itemized statement of receipts and expenditures for the two years preceding under the operations of this act.

(7) The director of said experiment station is hereby authorized, in person or by deputy, to take samples for analysis from any bag or other package or quantity of any commercial fertilizer in the possession of any dealer or transportation company in this State; to enforce the provisions of this act, and to make and enforce such rules and regulations as he may deem necessary to carry fully into effect the true intent and meaning of this act.

(10) The director of said experimental station shall annually analyze or cause to be analyzed at least one sample of every fertilizer sold or offered for sale under the provisions of this act; and he shall publish in one or more bulletins the analyses made during the year, together with the relative commercial value of each fertilizer computed from its analysis as he may determine, and the analysis guaranteed by the manufacturer.

(11) To facilitate the inspection of fertilizers, the director is authorized to require all manufacturers making shipments into or within this State to notify him of the kinds, amounts, dates, destinations, and the consignee of all such shipments.

SEC. 1905a. (4) The experiment station of the Agricultural and Mechanical College, hereby designated as the Kentucky Agricultural Experiment Station, shall make analysis of food products on sale in Kentucky suspected of being adulterated at such times and places and to such extent as the director thereof may determine. And the director of the said Kentucky Agricultural Experiment Station may appoint such agent or agents as he deems necessary, who shall have free access at all reasonable hours, for the purpose of examining into any place wherein it is suspected any article of food adulterated with any deleterious or foreign ingredient or ingredients exists, and such agent or agents, upon tendering the market price of said article, may take from any person, firm, or corporation samples of any article suspected of being adulterated as aforesaid, and said station may adopt or fix standards of purity, quality, or strength when such standards are not specified or fixed by statute.

(5) Whenever said station shall find by its analysis that adulterated food products have been on sale in the State it shall forthwith transmit the facts so found to a grand juror or prosecuting attorney of the district in which said adulterated food product was found.

(6) Said station shall make an annual report to the governor upon adulterated food products, in addition to the report required by law, which shall not exceed 150 pages, and said report may be included in the report which said station is already authorized by law to make, and such annual reports shall be submitted to the general assembly at its regular session.

(8) The said Kentucky Agricultural Experiment Station shall receive for taking samples within the provisions of this act, and for analysis of the same, only actual traveling expenses and \$5 for each sample taken and analyzed, to be paid by the Commonwealth of Kentucky upon warrant of auditor as other claims, but recovered of the owner of such article of food if declared upon inspection to be found adulterated or misbranded within the meaning of this act. The expenses of above inspections shall in no year exceed \$2,500.

(9) All fines recovered under this act shall be kept as a separate fund to pay necessary expenses in maintaining same.

SEC. 1925a. All nurseries in Kentucky where trees, vines, plants, or other nursery stock are grown and offered for sale shall be inspected by the entomologist and botanist of the State Agricultural Station once each year at such time as he may elect, and he shall notify, in writing, the owners of such nurseries, the commissioner of agriculture and statistics, the director of the State Agricultural Experiment Station, and the president of the State Horticultural Society of the presence of any San Jose scale or other destructively injurious insects or fungi on the trees, vines, plants, or other stock of such nurseries, and shall also notify, in writing, the owner of any affected stock that he is required, on or before a certain day, to take such measures for the destruction of such insect or fungus enemies of nursery stock as have been shown to be effectual for this purpose. Said entomologist and botanist shall, for the purpose of this act, be, and he is hereby, declared to be the State entomologist, and shall serve without pay other than that he may receive as an officer of the State Agricultural Experiment Station, but his expenses shall be paid as hereinafter provided.

(7) The sum of \$500 annually, or so much thereof as may be necessary, is hereby appropriated for the purpose of paying the expenses of the State entomologist in the performance of his duties under the provisions of this act, and the auditor of public accounts is hereby directed to honor requisitions made by said State entomologist for expenses incurred in the performance of his duties.

Acts of the general assembly, 1900, chapter 24. SECTION 1. The sum of \$60,000, or as much as may be necessary therefor, is hereby appropriated for the purchase of ground and the erection thereon of a suitable building as a dormitory for young women students of the Agricultural and Mechanical College of Kentucky, and the equipment and furnishing thereof, which dormitory shall be capable of lodging and boarding comfortably 125 persons; also for the purpose of erecting and equipping a suitable building for military instruction, physical culture, and rooms for Young Men's Christian Association; also for the erection and equipment of a suitable building for the use of the normal department and for the use of the academy; also for the erection and equipment of a dormitory for young men students of said college; also for the purpose of erecting and furnishing an annex for the use of the engineering departments of said college.

SEC. 4. The board of trustees shall appoint three prudent, discreet, intelligent women, members in good standing of one of the religious organizations recognized by the laws of the United States, who shall constitute a board of supervision or control to manage and superintend, under the direction of the board of trustees, the dormitory for young women. The term of service shall be for six years; but the first appointments shall be, one for two years, one for four years, and one for six years, respectively, and thereafter, upon the expiration of their terms of service, one shall be appointed at the close of each biennial period to fill the vacancy: *Provided, however*, That the board of trustees shall have power at any time to remove any member of the board of control for reasons which they may deem sufficient and to fill the unexpired term by an ad interim appointment. Said board of supervision shall meet at convenient intervals for the transaction of business. They shall keep a record of their proceedings and submit the same to the board of trustees at their regular meetings. Their receipts and expenditures shall be embodied in semiannual reports to the board. They shall, when the dormitory is ready for the reception of students, submit to the board of trustees for their approval, or to the executive committee, if the board of trustees be not in session, a body of regulations in relation to their administration of the business of the dormitory and in relation to the conduct and discipline of its occupants. The members of the board of supervision or control shall receive no salary; but the necessary expenses incurred in the discharge of their duties shall be paid out of the funds set apart for the administration of the woman's dormitory. \* \* \*

SEC. 7. The duties of the board of supervision or control shall be concerned exclusively with the management of the woman's dormitory and shall in no wise relate to the college privileges, duties, and relations of the young women, nor to the requirements of the faculty regarding their work or the discipline and control of the faculty over them as students.

SEC. 8. The president of the college shall, as the representative of the board of trustees, have the same general authority in regard to the woman's dormitory which he is expected and required to exercise over the interests all and singular of the college, and any occupant of said dormitory who may feel aggrieved by the act of the board of control or the subordinate appointees shall have the privilege of appeal to the president of the college, whose decision shall be final until the next meeting of the executive committee.

SEC. 9. Women students attending said college as beneficiaries and appointees of counties or legislative districts shall have preference for accommodations in said woman's dormitory, and if the accommodations of said dormitory are not sufficient for all such appointees, then the proper authorities of said college shall decide, in some way fair and equitable, who shall be entitled to said accommodations, all counties being given equal representation as nearly as possible. If any rooms in said dormitory remain after all such appointees are accommodated, other female students may be allowed the use thereof, each county being given equal representation as nearly as possible. All rooms shall be assigned by lot three days after the session opens. Like rules and preferences shall be observed in regard to dormitory accommodations provided for men students at said college. All rooms shall be assigned by lot three days after the session opens.

SEC. 4527. The State normal school for colored persons, established by an act of the general assembly May 18, 1886, shall hereafter (i. e., after May 22, 1893) be under the control and supervision of a board of trustees, composed of the superintendent of public instruction, who shall be ex officio chairman of the board, and three intelligent and discreet persons, residents of Franklin County, to be appointed by the governor, subject to the approval of the senate, who are hereby constituted a body corporate, with power to sue, etc., and to hold in trust all funds and property now owned by said school or which may hereafter be provided for it, and shall be known and designated as "The board of trustees of the Kentucky State Normal School for Colored Persons."

SEC. 4528. There shall be maintained in said institution a department for the education of colored students in agriculture and the mechanic arts, and for said purpose said board shall be entitled to receive an equitable division of the moneys arising from the sale of public lands and appropriated to the State of Kentucky by an act of Congress approved August 30, 1890.

SEC. 4534. The sum of \$3,000 shall be annually appropriated out of the State treasury to pay the teachers and defray other necessary expenses in the maintenance of said normal school, which amount, together with the sum received under the provisions of said act of Congress, shall be set apart and be known and held as the colored normal school fund. This fund shall be paid out of the State treasury only on the warrant of the auditor, drawn on the order of the board.

## LOUISIANA.

Constitution (1898): ART. 255. The Louisiana State University and Agricultural and Mechanical College, founded upon the land grants of the United States to endow a seminary of learning and a college for the benefit of agriculture and the mechanic arts, now established and located in the city of Baton Rouge, is hereby recognized, and all revenues derived and to be derived from the seminary fund, the agricultural and mechanical college fund, and other funds or lands donated or to be donated by the United States to the State of Louisiana for the use of a seminary of learning or of a college for the benefit of agriculture and the mechanic arts shall be appropriated exclusively to the maintenance and support of said Louisiana State University and Agricultural and Mechanical College, and the general assembly shall make such additional appropriations as may be necessary for its maintenance, support, and improvement, and for the establishment, in connection with said institution, of such additional scientific or literary departments as the public necessities and the well-being of the people of Louisiana may require: *Provided*, That the appropriation shall not exceed \$15,000 per annum for its maintenance and support.

ART. 258. The debt due by the State to the seminary fund is hereby declared to be \$136,000, being the proceeds of the sales of lands heretofore granted by the United States to this State for the use of a seminary of learning, and said amount shall be kept to the credit of said fund on the books of the auditor and treasurer of the State as a perpetual loan, and the State shall pay an annual interest of 4 per cent on said amount.

ART. 259. The debt due by the State to the agricultural and mechanical college fund is hereby declared to be the sum of \$182,313.03, being the proceeds of the sale of lands and land scrip heretofore granted by the United States to this State for the use of a college for the benefit of agriculture and mechanic arts, and said amount shall be kept to the credit of said fund on the books of the auditor and treasurer of the State as a perpetual loan, and the State shall pay an annual interest of 5 per cent on said amount.

ART. 260. The interest due on the free-school fund, the seminary fund, and the agricultural and mechanical college fund shall be paid out of any tax that may be levied and collected for the payment of the interest on the State debt.

ART. 307. The board of agriculture and immigration shall consist of one member from each Congressional district \* \* \* [and] the governor of the State, the commissioner of agriculture and immigration, the president of the State University and Agricultural and Mechanical College, the vice-president of the board of supervisors of the State University and Agricultural and Mechanical College, and the director of the State experimental stations shall be ex officio members of this board. The members of said board shall serve without compensation, except actual expenses incurred in attending the meetings.

[The following matter is taken from the Revised Laws of Louisiana, Compiled and Annotated by Solomon Wolff, of the New Orleans Bar. New Orleans, 1897.]

SEC. 593. An act of Congress of the United States, approved July 2, 1862, and the grant of land and land scrip thereby made, is hereby accepted on the part of the State of Louisiana.

SEC. 594. The said grant of land and land scrip is hereby accepted for the purposes and upon the conditions in said act of Congress specified, and the assent of the State of Louisiana to the several conditions and provisions in said act contained is hereby signified and expressed.

SEC. 595. The governor of the State, together with the chief justice of the supreme court and a commissioner to be duly appointed by them, are hereby appointed commissioners to receive from the Secretary of the Interior, or other officer of the United States, the land scrip to which the State of Louisiana is or may be entitled under the act of Congress aforesaid, and to sell and dispose of the same, and upon said sale being made by said commissioners, they are authorized to appoint one person to assign said land scrip in accordance with the rules of the Department of the Interior.

[The following matter is not incorporated as an integral part of the Revised Statutes proper, but as Acts of the Legislature.]

Act 145, 1876, page 18, of Acts of 1878: SECTION 1. The Louisiana State University, as now established and located at Alexandria, in the parish of Rapides, and the Louisiana State Agricultural and Mechanical College, as now established and located in the parish of St. Bernard, are hereby united and constituted into one and the same institution of learning, which shall hereafter be known and designated under the name and title of the Louisiana State University and Agricultural and Mechanical College, and that said institution of learning, the Louisiana State University and Agricultural and Mechanical College, as hereby created, shall be established temporarily at Baton Rouge, in the parish of East Baton Rouge.

SEC. 2. All legal rights and privileges as granted by the Congress of the United States and the legislature of Louisiana, and all the legal obligations and requirements as imposed by Congressional and legislative enactments, and binding upon the two institutions of learning, respectively, which have been, in the preceding section of this act, united and constituted into one and the same institution of learning, shall be of full force and effect with and upon the Louisiana State University and Agricultural and Mechanical College, as hereinbefore constituted and established, excepting such legal rights, privileges, obligations, and requirements as may be specifically repealed by the provisions of this act.

SEC. 3. The Louisiana State University and Agricultural and Mechanical College, as hereinbefore created, shall have for its object to become an institution of learning, in the broadest and highest sense, where literature, science, and all the arts may be taught: where the principles of truth and honor may be established, and a noble sense of personal and patriotic and religious duty inculcated; in fine, to fit the citizens to perform justly, skillfully, and magnanimously all the offices, both private and public, of peace and war.

SEC. 4. The Louisiana State University and Agricultural and Mechanical College, as hereinbefore created, shall provide general instruction and education in all the departments of literature, science, and art, and industrial and professional pursuits; and it shall provide special instruction for the purpose of agriculture, the mechanic arts, mining, military science and art, civil engineering, law, medicine, commerce, and navigation.

SEC. 5. The Louisiana State University and Agricultural and Mechanical College as hereinbefore created, constituted, and established shall be under the direction and control of fifteen supervisors, who shall be a body corporate, under the style and title of the board of supervisors of the Louisiana State University and Agricultural and Mechanical College, with the right as such to use a common seal, and who shall be capable in law to receive all donations, subscriptions, and bequests in trust for said university and agricultural and mechanical college and to recover all debts which may become the property of said university and agricultural and mechanical college, and to sue and be sued in courts of justice, and in general to

do all acts for the benefit of the Louisiana State University and Agricultural and Mechanical College which are incident to bodies corporate.

SEC. 6. The governor of the State shall be a member and ex officio president of the board of supervisors, and the State superintendent of public education and the president of the faculty of the university shall also be members ex officio of said board, and the twelve remaining members shall be appointed by the governor, by and with the advice and consent of the senate: *Provided*, That at least six of the fifteen supervisors of the university shall have been students of the Louisiana State University or of the Louisiana State University and Agricultural and Mechanical College, and shall have taken degrees and be titled graduates of one of said institutions. At least one member of said board of supervisors shall be appointed from the parish of East Baton Rouge. Whenever a vacancy occurs in said board for any cause the same shall be filled for the unexpired term. The terms of office of the present members of the board of supervisors as now constituted under appointments heretofore made shall in no manner be abridged, terminated, or affected by the provisions of this act, but whenever a vacancy shall hereafter occur for any cause in the board of supervisors, the same shall be filled by the appointment of a titled graduate of one of said institutions until at least six titled graduates aforesaid shall be members of said board of supervisors, and said board shall be thereafter so constituted and maintained (as amended by act 75, 1896, p. 107).

SEC. 7. Three of the twelve members of the board of supervisors to be appointed by the governor in accordance with the provisions of the foregoing section of this act shall be commissioned and hold their offices for one year, three for two years, three for three years, and three for four years. Their successors shall be appointed in like manner, and shall hold their offices for the full term of four years from the 1st day of January next succeeding their appointment, and until their successors are appointed and qualified.

SEC. 8. The member of the board of supervisors appointed for the parish of East Baton Rouge, in which, as hereinbefore provided, the Louisiana State University and Agricultural and Mechanical College has been temporarily established and located, shall be ex officio the vice-president of the board, to preside over the meetings of the board in the absence of the governor. Five members of the board of supervisors, including the president or vice-president, shall constitute a quorum for the transaction of business: *Provided*, That all the acts of said five members, at said such meeting, shall be submitted for ratification or rejection at the next meeting of the board of supervisors, when a majority of all the fourteen members of the board may be present.

SEC. 9. There shall be four regular stated meetings of the board of supervisors at the university in each and every year—one on the first Monday in April, another on the Monday before the close of the annual session of the university, which shall be July 4; another on Monday before the opening of the annual session of the university, which shall be October 5, and another on the first Monday in December. Special meetings of the board of supervisors shall be called in such manner and held at such other times and places as the governor of the State or the board of supervisors may determine.

SEC. 10. The board of supervisors shall, at their first meeting, elect a secretary, who shall record, attest, and preserve their proceedings, and a treasurer, who shall give bond for the faithful performance of his duties, and in such sum as shall be determined by the board: *Provided*, That the treasurer shall not be a member of the board of supervisors, nor a professor or other officer or other employee of the university: *And provided further*, That the treasurer shall never be interested, directly or indirectly, in any contract for furnishing supplies or articles of any kind to the university, or have any business transactions with or on account of the university that tend directly or indirectly to his own personal profits; nor shall any money ever be paid to the treasurer in his personal capacity, or on account of the university, except what may be his salary or compensation as treasurer.

SEC. 11. The board of supervisors shall have power to engage a president and other professors and all other officers necessary for conducting the literary, scientific, military, and technical departments, and all the financial and civil concerns and interests of the university, and to remove and displace the same at pleasure; to fix and regulate the salaries of the professors and all other officers, and to determine all other changes, excepting that there shall be no fee for tuition or for the use of the library, apparatus, laboratory, cabinets, museum, workshop, experimental farm, or other educational appliances charged to any student or cadet; to establish rules for the good government and discipline of the students or cadets; to prescribe the duties of all officers, employees, servants, and others; to confer

diplomas, upon the recommendation of the president and faculty, on students for proficiency in any branch of literature or science or department of learning, and in general to make all rules and regulations which may be deemed necessary for the proper government of the university, and for promoting the objects for which it has been founded. But nothing in this act shall be construed as obligating the State to pay any debt contracted by the board of supervisors in case it should at any time exceed the appropriation made for the institution, nor shall any of the property of the university ever be seized and sold to pay any debt of the institution by virtue of any decree of court. The title to all property owned and held by the Louisiana State University and Agricultural and Mechanical College is hereby declared to vest in the State of Louisiana.

SEC. 12. There shall be maintained in the Louisiana State University and Agricultural and Mechanical College, as hereinbefore constituted and established: (1) Schools of literature, including the languages of the principal nations of ancient and modern times, philosophy, logic, rhetoric, and elocution, history, ethics, metaphysics, and such other and special branches of learning as the board of supervisors may determine; (2) schools of science, including mathematics, astronomy, engineering, architecture, drawing, physics, chemistry, botany, zoology, agriculture, mechanics, mining, navigation, and commerce, and such other special branches of learning as the board of supervisors may determine; (3) schools of the useful and fine arts and of military science and art; (4) schools of medicine and law; (5) such other schools as the board of supervisors may establish.

SEC. 13. The board of supervisors may affiliate with the Louisiana State University and Agricultural and Mechanical College any incorporated university or college or school of medicine, law, or other special course of instruction, upon such terms as may be deemed expedient; and such university, college, or school may retain the control of its own property, have its own board of trustees, faculties, and president, respectively; and the students of such universities, colleges, or schools recommended by the respective faculties thereof may receive from the Louisiana State University and Agricultural and Mechanical College the degrees of those universities, colleges, or schools, and the said students of said institutions of learning or special schools thus graduated shall rank as graduates of the Louisiana State University and Agricultural and Mechanical College.

SEC. 14. It shall be the duty of the board of supervisors immediately after its organization to prescribe, in detail, the course of studies, both theoretical and practical, to be pursued at the university and agricultural and mechanical college, and to draw up a project of the system of instruction so adopted.

SEC. 15. The board of supervisors shall be charged with the purchase of all the necessary grounds and land for the purpose of the university and agricultural and mechanical college, and with the purchase or erection, or both, as may be necessary, of all requisite buildings, workshops, laboratories, and other fixtures and contrivances needed for the academic, military, industrial, or other departments of the university and agricultural and mechanical college, and with the purchase of all necessary supplies or articles for the use of the university and agricultural and mechanical college: *Provided*, That no member of the board of supervisors shall have any personal interest in any contract or purchase or sales or in any business transaction of any kind whatever for or on account of said university and agricultural and mechanical college; and said board of supervisors shall be charged with the care and preservation of all the buildings, grounds, and appurtenances of the university after they shall have been provided.

SEC. 16. The board of supervisors are hereby empowered to lease as early as may be practicable and invest the proceeds thereof in the stocks of the State of Louisiana, or in the stocks of the United States, all the buildings and grounds and lands belonging to and held by the Louisiana State University, as it was established and located in the parish of Rapides prior to the passage of this act, and to sell or lease all the buildings and grounds and land belonging to and held by the Louisiana Agricultural and Mechanical College, as it was established and located in the parish of St. Bernard prior to the passage of this act; and said stocks or bonds shall be deposited for safe-keeping with the treasurer of the State.

SEC. 17. For the endowment, support, and maintenance of the Louisiana State University, as heretofore created, constituted, and established, there shall be and is hereby inviolably appropriated and placed at the disposal of the board of supervisors thereof, to be drawn from the State treasurer, upon the order of the president of the board, made upon the auditor of the State, countersigned by the secretary of the board, and payable to the order of the treasurer of the board of supervisors, all the interest and income derived and to be derived from the sales of all lands granted or that may hereafter be granted to the State of Louisiana by the United States for the use of a seminary of learning, and all the interest and

income of the fund derived or to be derived from the sales of all land and land scrip granted, or that may hereafter be granted to the State of Louisiana by virtue of an act of Congress approved July 2, 1862;<sup>a</sup> and all the interest and income of the funds to be derived from the lease of the buildings, grounds, and lands in the parish of Rapides and owned by or held for the use of the Louisiana State University, as it existed prior to the passage of this act; and from the sale or lease of the buildings, grounds, and lands in the parish of St. Bernard owned by or held for the use of the Louisiana Agricultural and Mechanical College, as it existed prior to the passage of this act; and all such gifts, grants, contributions, and other donations to the endowment thereof as may be derived from any and all sources.

SEC. 18. It is particularly enjoined upon the board of supervisors of this university and agricultural and mechanical college to make the training in those branches of study relating to agriculture and the mechanic arts as practical as possible, and to that end to provide the necessary workshops and laboratories, and to secure suitable land in the vicinity of the university and agricultural and mechanical college for an experimental farm. For the purchase of an experimental farm the board of supervisors is hereby authorized to expend a sum not exceeding the amount specified in the act of Congress hereinbefore mentioned, viz, 10 per cent upon the amount received by the State as the proceeds of the sale of the lands and the land scrip donated by the General Government of the United States.

SEC. 19. Immediately after the passage of this act it shall be the duty of the governor of the State to appoint the members of the board of supervisors, who shall convene within ten days after the passage of this act at Baton Rouge, in the parish of East Baton Rouge, for the purpose of electing the officers of the board and of organizing the university and agricultural and mechanical college, to the end that it may be in full and successful operation as early as possible.

SEC. 20. At the regular stated meeting in December of each and every year the board of supervisors shall, through the governor of the State, make a report in detail to the legislature, showing the true condition and wants of the university and agricultural and mechanical college, and recording any improvement and experiments made in agriculture and the mechanic arts, with their costs and results; the names of the professors and students; the amount of receipts and disbursements, together with the nature, costs, and results of all important scientific investigations and experiments in the useful arts, and such other matters, including State, industrial, and commercial statistics, and literary, historical, philological, philosophical discussions or essays as may be deemed important or useful, one copy of which shall be transmitted to all the other colleges which shall be endowed under the provisions of an act of Congress of July 2, 1862, as hereinbefore mentioned.

SEC. 21. The president of the Louisiana State University and Agricultural and Mechanical College shall be the president of the faculty of professors thereof and executive head of the institution in all its departments. As such officer he shall have authority, subject to the board of supervisors, to give general direction to the practical affairs and scientific investigations of the university and agricultural and mechanical college, and in the recess of the board of supervisors to remove any employee or subordinate officer not a member of the faculty, and supply for the time any vacancies thus created; and so long as the interests of the institution require it he shall be charged with the duties of one of the professorships; and it shall be the duty of the president of the university and agricultural and mechanical college to make to the State superintendent of public instruction, on or before the first Monday in December in each year, and every year, a report in detail showing the progress and condition of the university, the names of the professors and students, the nature, costs, and results of all important investigations and experiments, and such other matters, including industrial, economical, philosophical, and educational statistics as he shall deem useful.

SEC. 22. The president of the university and agricultural and mechanical college shall be specially charged with the discipline of the university and agricultural and mechanical college, and be held responsible for the good order of the establishment, and especially for the conduct and behavior of the students or cadets. And it is hereby declared not to be the intent of this act to devolve in

<sup>a</sup>The funds granted to the State of Louisiana by an act of Congress approved August 30, 1890, are divided between the Louisiana State University and Agricultural and Mechanical College and the Southern University (for colored students) on the basis of the school population of the two races.

any way upon the professor, as such, or upon the faculty of professors, the maintenance of good order and discipline among the students or cadets, or to hold them responsible for the conduct or behavior of the cadets or students outside of their class or lecture rooms and during the time of recitation, or study, or lecture; and it is particularly enjoined upon the board of supervisors to delegate to the president of the university and agricultural and mechanical college, and through him to such assistant disciplinarians as may be assigned him from among the professors and assistant professors, sufficient authority to enable him to maintain proper discipline and good order, and to meet promptly and efficiently the great responsibility hereby imposed on him. No student or cadet shall ever be tried by the faculty or professors or by any committee of professors for any breach of discipline or other misconduct. But no provision of this section or this act shall be construed as militating against a proper subordination of professors or other officers to the president of the university and agricultural and mechanical college, and the necessity of obeying all the rules and orders which he may impose on them in virtue of the provisions of this act, and of the rightful authority delegated to him by the board of supervisors, as hereby enjoined upon the board; and the president of the university and agricultural and mechanical college shall have the power to assemble the faculty or any committee or number of the professors at any time he may see fit for consultation or advice or other action, on any subject-matter he may choose to lay before them, provided only, that in all matters of discipline and relating to the conduct and behavior of students and cadets the president alone, and not the faculty or any professor, shall decide and act.

SEC. 23. The State of Louisiana in its corporate capacity may take by grant, gift, devise, or bequest any property for the use of the Louisiana State University and Agricultural and Mechanical College, or any school thereof, or of any professorship, chair, or scholarship therein, or for the library, museum, observatory, workshops, experimental farm, apparatus, cabinet, or for any purpose appropriate to the university and agricultural and mechanical college; and such property shall be taken, received, held, managed, and invested, and the proceeds thereof used, bestowed, and applied by the said board of supervisors for the purposes, provisions, and conditions prescribed by the respective grant, gift, devise, or bequest, and in accordance with the provisions of sections 5, 11, and 17 of this act.

SEC. 25. The board of supervisors may invest any of the permanent funds of the Louisiana State University and Agricultural and Mechanical College which are now, or may hereafter be, in its custody, in productive, unincumbered real estate in this State, subject to the power of the legislature; to control or change such investments, excepting such as by the provisions of previous sections of this act, or by the terms of their acquisition must be otherwise invested.

SEC. 26. If, by the terms of any grant, gift, devise, or bequest, such as are hereinbefore described in sections 23 and 24 of this act, conditions are imposed which are impracticable under the provisions of the revised statutes of this State, such grants, gifts, devise, or bequest shall not thereby fail, but such conditions shall be rejected and the intent of the donor carried out as near as may be.

Acts 1886, No. 100: SECTION 1. Each parish as now created or that may hereafter be created in the State shall have the right to delegate to the Louisiana State University and Agricultural and Mechanical College one beneficiary cadet, and the city of New Orleans shall have the right to delegate to said institution 17 beneficiary cadets, or one from each ward of said city; said beneficiaries to remain at said institution four years, unless sooner graduated or otherwise discharged: *Provided*, That no beneficiary cadet shall be permitted to resign from said institution without the consent of the board of supervisors thereof, which consent shall be given only in a case of urgent necessity, such as serious and long protracted ill health, duly declared by the certificate of the surgeon of said institution, or other competent physician, to be of such nature as to render it impossible for said cadet to pursue his studies with advantage.

SEC. 2. The police jury of each parish and the city council of New Orleans, respectively, may, at a regular meeting, elect the number of beneficiary cadets to which said parish or city is entitled as aforesaid, of such age and qualifications as may be prescribed by the board of supervisors for admission to one of the college classes of said university and agricultural and mechanical college, and shall cause the beneficiary so selected to report in person to said institution on or before said 5th day of October: *Provided*, That said beneficiary cadets shall be selected from the number of those residents of said parish or of said city who have not themselves, nor have their parents, the means of defraying the whole of their necessary expenses of maintenance and support at said institution, which facts shall be duly

certified to the president of said institution by the president of said police jury or said city council of New Orleans as true, to the best of his knowledge and belief.

SEC. 3. For the maintenance and board of said beneficiaries in said institution the sum of \$10,710 is appropriated annually, for two years, out of any funds in the treasury not otherwise appropriated. \* \* \*

SEC. 4. For the maintenance and board of said beneficiaries in said institution the police juries of the several parishes and the city council of the city of New Orleans are authorized and empowered to appropriate out of their respective treasuries a sufficient sum to defray the necessary expenses of said cadets as appointed under the provisions of this act: *Provided*, That the expense of no cadet shall exceed \$250 per annum: *Provided further*, That under no circumstances shall any part of this sum be paid by the State.

SEC. 5. In order to take advantage of the right granted to each parish and to the city of New Orleans in section 1 of this act, each parish and said city shall make an appropriation of \$150 per annum out of any money in its treasury for the maintenance and board in said institution of each beneficiary cadet delegated by said parish or said city, said sum to be paid to the treasurer of such institution before the admission of said cadet; and the power to make such appropriation is hereby granted to the police juries of the several parishes and to the city council of New Orleans.

Acts 1888, No. 100: Gives legislative assent to grants of money by Congress to establish "agricultural experiment stations" and ratifies the resolutions adopted on April 5, 1887, by the board of supervisors of the Louisiana State University and Agricultural and Mechanical College, in connection therewith.

Acts 1892, No. 17: Provides "that full and complete acceptance, ratification, and assent are hereby made" by the State to an act of Congress (July 2, 1862 <sup>a</sup>) applying a portion of the proceeds of public lands to the endowment of colleges for the benefit of agriculture and the mechanic arts.

SEC. 1331. The "State Seminary of Learning,"<sup>b</sup> established near the town of Alexandria, in the parish of Rapides, shall be hereafter designated as "The Louisiana State Seminary of Learning and Military Academy," and shall be under the direction and control of fourteen supervisors, who shall be a body corporate under the style and title of the "Board of Supervisors of the Louisiana State Seminary of Learning and Military Academy," with the right as such to use a common seal, and who shall be capable in law to receive all donations, subscriptions, and bequests in trust for said seminary and academy, and to receive all debts which may become the property of said seminary and academy, and to sue and be sued in courts of justice, and in general to do all acts for the benefit of the seminary and academy which are incident to bodies corporate.

SEC. 1332. The governor of the State shall be ex officio president of the board of supervisors, and the chief justice of the supreme court, the superintendent of public education, and [the] State engineer shall be ex officio members of said board. The remaining ten members thereof shall be appointed by the governor, by and with the advice and consent of the senate, for four years, and they shall continue to exercise the duties of their office until their successors are qualified, and they shall be removed by the same power and in the same manner as provided for in their appointment. The governor shall select said remaining members as follows. \* \* \*

SEC. 1334. The board of supervisors shall have power to engage a superintendent and other professors and all other officers necessary for conducting the literary, financial, and civil concerns and interests of the said seminary and academy, and to remove the same at pleasure; to fix and regulate the salaries of the professors and all other officers, tuition fees, and all other charges; to establish rules for the good government and discipline of the students; to prescribe the duties of all officers, servants, and others; to confer diplomas, upon the recommendation of the superintendent and faculty, on students for proficiency in any branch of science or department of learning, and in general to make all rules and regulations which may be deemed necessary for the proper government of the said seminary and academy and for promoting the objects for which it was founded, but nothing in this act shall be construed as obligating the State to pay any debts contracted by the board of supervisors in case they should at any time exceed the appropriation made for the support of said seminary and academy.

SEC. 1335. In the course of study pursued at the said seminary and academy the board of supervisors shall cause instruction to be given in the military branches of science, the students shall be styled "cadets," and shall compose a military corps

<sup>a</sup> August 30, 1890.

<sup>b</sup> Subsequently known, by an act of 1870, as the Louisiana State University. Gen. W. T. Sherman was its first superintendent.

under the command of the superintendent and such other professors as may be assigned to that branch of instruction. They shall constitute a guard to all public property, arms, or munitions now there or which may be hereafter assembled there, and the superintendent shall receipt for all such property, arms, or munitions, and obey all orders relative to their preservation or delivery he may receive from the governor of the State.

SEC. 1336. The governor of the State shall cause to be issued to the superintendent a commission as colonel, and to such other professors as may be assigned to command commissions as majors, captains, or lieutenants, according to the strength of the command; that such commissions shall not entitle the holders to any rank in the militia of the State or to any claims whatever to compensation other than what is attached to their positions as professors.

SEC. 1340. The board of supervisors shall at their first meeting elect a secretary, who shall record, attest, and preserve their proceedings, and a treasurer, who shall give bond for the faithful performance of his duties, and in such sum as shall be determined by the board.

SEC. 1341. It shall be the duty of the board of supervisors, immediately after their organization, to prescribe the course of studies to be pursued at the seminary, the number of professors, and to draw up a project of the system so adopted.

SEC. 1342. The board of supervisors shall at all times conform to such laws as the legislature may from time to time enact for their government, and the said seminary shall in all things and at all times be subject to the control of the legislature; and the said board of supervisors shall make an annual report to the legislature during the first week of the session, embracing a full account of the disbursements and a general statement of the condition of said seminary.

SEC. 1343. No gambling house or drinking saloon or store for the barter or sale of any kind of merchandise whatsoever shall be established within 2 miles of said institution.

SEC. 1344. It shall be the duty of the board of supervisors of the Louisiana State Seminary of Learning and Military Academy to require the professor of engineering and the professors of chemistry, mineralogy, and geology to spend not less than four months of every year in making jointly a topographical and geological survey of the State of Louisiana till the whole work is completed to the satisfaction of the legislature.

SEC. 1345. It shall be the duty of said professor of engineering and chemistry to make, on the 31st day of December of each year, detailed reports, with the necessary maps and diagrams of their survey, to the superintendent of said institution, and it shall be the duty of said superintendent to forward said reports with his own annual report to the board of supervisors for transmittal to the legislature in the annual report of said board.

SEC. 1346. It shall be the duty of the superintendent of said institution to consider the topographical and geological survey of the State as herein provided for as a part of the regular duties of said institution and to superintend the same accordingly.

SEC. 1347. Said professors of engineering and chemistry \* \* \* be allowed each the sum of \$500 for necessary traveling expenses while in the performance of said duties, to be paid to the treasurer of said institution on the warrant of the president or vice-president of said board of supervisors.

Acts 1880, No. 87. SECTION 1. There shall be established in the city of New Orleans a university for the education of persons of color, to be named and entitled the "Southern University." *a*

SEC. 2. The said university shall be governed and directed by a board of trustees, to be composed of twelve members, who shall be appointed by the governor by and with the advice and consent of the senate: *Provided*, That at least four of said board of twelve shall be appointed from the colored race; vacancies shall be filled in a similar manner. The members of the board shall be appointed to serve during four years, but any member failing to attend two successive regular meetings of the board shall, except in case of sickness or other good cause, be considered no longer a member of said board, and the governor, on receiving official notice of such absence from the president of the board, whose duty it shall be to report the same, shall immediately fill the vacancy in the manner prescribed.

SEC. 3. Six members of said board, at a stated or regularly called session, shall constitute a quorum.

<sup>a</sup>The constitution (art. 256) recognizes the Louisiana State Normal School \* \* \* and the Southern University, now established in the city of New Orleans for the education of persons of color; and in the case of the Southern University no annual appropriation for maintenance and support shall exceed \$10,000.

SEC. 4. Said board of trustees shall be empowered to elect from among their own members a president and vice-president of the board, a secretary, and treasurer; the treasurer shall give bond in the sum of \$10,000 for the faithful performance of his duties, and shall pay out money only upon warrants issued by the president of the board, countersigned by the president of the faculty: *Provided*, That the treasurer shall not be a professor or other officer or employee of the university, and shall not be interested, directly or indirectly, in any contract for furnishing supplies or articles of any kind to the university: *Provided further*, That at the discretion of the board the two offices of secretary and treasurer may be combined in one person.

SEC. 5. Said board of trustees shall be empowered to enact general rules and by-laws for the said university in all its departments, and to elect a president of the faculty, professors, and teachers, and determine their compensation; also, all officers and employees that may be necessary, and prescribe their duties and compensation.

SEC. 6. Said university shall be organized as a corporation under the general laws of the State of Louisiana, and the trustees thereof shall be capable in law to receive all donations, trusts, and bequests made to the "Southern University," and manage the same, to sue and be sued in courts of justice, and to do all other acts in the premises incident to such trustees.

SEC. 7. There shall be established by said board of trustees a faculty of arts and letters, which shall be competent to instruct in every branch of a liberal education, and under rules of and in concurrence with the board of trustees, to graduate students and grant all degrees appertaining to letters and arts known to universities and colleges in Europe and America on persons competent and deserving the same. There may also be established by said board of trustees a department of law and medicine. The department of law shall consist of three or more learned professors, learned and skilled in the practice of law in this State, who shall be required to give a full course of lectures on international, constitutional, commercial, and municipal or civil law, and instruction in the practice thereof. The medical department of the university shall consist of not less than three professors. They shall be appointed by the board of trustees from regular practicing physicians of the State. The degree of bachelor of law and doctor of medicine, granted by them, shall authorize the person on whom it is conferred to practice law and physic and surgery in this State (as amended by act 90, 1883).

## CHAPTER II.

### FRANKLIN'S INFLUENCE IN AMERICAN EDUCATION.

By FRANCIS NEWTON THORPE.

---

The riches of a country are to be valued by the quantity of labor its inhabitants are able to purchase, and not by the quantity of silver and gold they possess.—*Franklin*.

Neither must we cast a slight upon education, which is the first and fairest thing that the best of men ever have, and which, though liable to take wrong direction, is capable of reformation. And this work of reformation is the great business of every man while he lives.—*Plato*.

I think a general government necessary for us, and there is no form of government that may not be a blessing if well administered; and I believe, further, that this is likely to be well administered for a course of years, and can only end in despotism, as other forms have done before it, when the people shall become corrupted as to need despotic government, being incapable of any other.—*Franklin*.

#### THE ARTISAN AND THE ART.

The artisan.

Among the creative minds of the eighteenth century was one whose sanity has profoundly influenced posterity. He was an American, the new world's gift to the old. It has been common to praise him these hundred years. He was a man of the people and was familiar with all sorts and conditions of men. His ancestry enrolled a long line of freemen, when to be free by right was a greater honor than a patent of nobility. Through the centuries of their enjoyment of a free estate his ancestors followed habits which made them thrifty and wise. For more than four score years of the fertile eighteenth century he grew with its growth and he ripened in the closing years of its rich maturity. Among his contemporaries, and they included Hume and Voltaire, he was assigned a unique place by common consent. To men whether of low or of high degree his relations were normal; indeed he was so much the cosmopolitan that his name before his death became the American name most familiar to Europeans, and in his own country as familiar as Washington's.

Self-adjustment.

Yet this man, this child of an ancient line of English franklins, this plain American who stood before Kings, was somewhat unconventional in his education, for he became a wise man by teaching himself. His records of the process of his self-culture remain the maxims of a world experience. Intimately knowing himself, he knew all men, and therefore

his comments on his own education have generic value. The mechanics of education, which distinguishes the modern systems, he knew well and prized little. Though they largely fill the eye of later generations, they did not blind him. He never suggested any device for shortening the distance between points measured on a straight line, nor to the armory of teaching did he contribute any instrument wherewith one may learn without thinking. To him life was a series of adjustments, and education was subjective because it is a process in self-adjustment. With him self-culture is a series into eternity and man is given a place in the file not of the worst rank. Unlike some of his eminent contemporaries he was not secretive. His experience like life itself was a property of man and akin to the experiences of others, therefore it had a general value, and its utilities truly comprehended contribute to the general welfare.

Unselfishness. His unselfishness was of the kind that we see in trees and plants, which fruit in due season with no thought of making the human race their debtors. As the race cherishes trees and plants, so, and in greater degree, should it cherish the memory of its own members who have produced wholesome ideas and have left good works. To such as do these things education is not a secret art. It is a process open to all men. It is a condition, not an aspect of life. The economy of education is a moral thrift, and an individual as well as a social function. It is not a mere academic afterthought, an epilogue to reality spoken by the speculatist. The man of whom I am speaking was an economist, for he was the first to teach the world that the unit of the measure of value is labor; and he was among the first to confute the ancient and false doctrine that wealth consists only in the possession of land, of precious metals, of jewels and other chattels. He learned his economy by large and intimate association with his fellow-men. Obscure and isolated data were not sufficient to support his ideas. All the world was the parish of his intellection; he was a servant to truth. His work, like that of Homer, was as simple as art. His process in self-culture was natural.

Moral thrift. This man was Benjamin Franklin. As Hume stands to philosophy, so stands Franklin to the world of affairs. He taught Malthus, Ricardo, and Adam Smith, because he knew men. His aptest scholar was himself. Nor did he omit that adjustment too often missed by men—the provision for the spread of his ideas. Yet he did not assume the oracular, though he proved to be a prophet. Nations have prospered by adhering to his principles. The general welfare of man has reached a higher level because he lived. His name is identified with the founding of institutions whose utility insures their permanency, and he was wise enough to know that the most permanent foundations in the world are educational. The public library which he founded in Philadelphia—the first in America and the parent of thousands of others—has contributed to the education of the people of the United States. The American Philosophical Society, the oldest learned society in this country, was founded by him and has been a coordinating force in furthering the cause of all forms of knowledge. The University of Pennsylvania, in the inception of which he was the leading spirit, has trained nearly a hundred thousand men. Millions of men, ignorant of the wisdom of Adam Smith, of John Stuart Mill, and of later economists of eminence, have been taught habits of thrift and have better provided for their wives, their children, and themselves by practicing the homely precepts of Poor Richard. Who can estimate that multitude, in all lands blessed with civilization, who have found pleasure, encouragement, and instruction in reading and rereading the first of American biographies?

The theme. It can not be unprofitable, therefore, to trace the principles and narrate the history of that educational process and that economy with which Franklin is identified. He who looks for simplicity in

modern educational methods is soon overwhelmed with dismay. On account of the system, the books, and the teachers he can not see the scholars. Theories and discussions often exclude economy. Not soldiers, but strategy and tactics possess the field. The tenant neglects to pay his rent in order to discuss it. The laborer forsakes his hire in order to speculate upon it. A system of education instead of being a natural process may be made a tyrannical schedule. It may become an exercise with books instead of an evolution of a soul by self-culture.

Peers.

Franklin stands easily with the first; with Homer, from whom all later poets take inspiration; with Plato, who distributes the germens of philosophy; with Cæsar, who taught war and politics with equal ease; with Hume and Burke, who examined the foundations of politics in the eighteenth century and revised the definitions of the state. With these stands Franklin, the apostle of individuality, upon which the modern representative state rests. Given the individual, and, according to Franklin, you have the state. The culture of the individual is a measure of the culture of the state. Thus he is the Socrates of modern times; the American Socrates.

Of permanent interest. Franklin's ideas of education and economy and their influence on America are the subject of my story. In outlining his ideas of education, I shall touch on his economic notions, for a man's political economy must be understood before attempting to understand his ideas on other subjects. The interests of self-culture are permanent, and their direction and administration determine the course of public opinion. The influence of Franklin's self-culture is immeasurable; its regulating principles may for a time be obscured, but, like other principles, they ultimately prevail.

Birth and breeding. He tells us that he "was born and bred in poverty and obscurity, from which he emerged to a state of affluence and some degree of reputation in the world, and that he went through life with a considerable share of felicity." He frequently reflected on his worldly prosperity and was happy to record that his family was of homely but goodly stock of the middle class of ancient England, and that of his maternal grandfather, Peter Folger, even so distinguished a divine as Cotton Mather had made honorable mention as "a godly, learned Englishman."

He was not sent to college, because his father considered a college education too expensive; "the mean living many so educated were afterwards able to obtain" was a sufficient proof to the elder Franklin that worldly success was not surely to be won after so great an expense.

To understand Franklin's notions of self-culture it is necessary to trace his own. He remembered in his old age how his father "at his table liked to have, as often as he could, some sensible friend or neighbor to converse with, and always took care to start some ingenious or useful topic for discourse which might tend to improve the minds of his children. By this means he turned our attention to what was good, just, and prudent in the conduct of life." This insight into his childhood shows how early in life his mind was impressed with the paramount importance of things ingenious or useful, and to the end he judged of the value of men's labors by their usefulness to mankind.

When it was to be decided at what employment he should be put, his father sought a practical solution of the problem by taking him to walk with him "and see joiners, bricklayers, turners, braziers, etc., at their work, that he might observe my inclination and endeavor to fix it on some trade or profession that would keep me on land. It has ever since been a pleasure to me to see good workmen handle their tools, and it has been often useful to me to have learnt so much by it as to be able to do some trifling jobs in the house, when a workman

could not readily be got, and to construct little machines for my experiments while the intention of making the experiment was fresh and warm in my mind."

From a child he was fond of reading, and the little money that came into his hands he spent for books. <sup>\* The books he read when a child.</sup> It is natural for a man to insist that the education of the young should be like that which he received himself. The books which Franklin read in his boyhood remained in his opinion the proper books for all children to read. The Pilgrim's Progress, Burton's Historical Collections, De Foe's Essay on Projects, and Dr. Mather's Essays to do Good had an influence on some of the principal events of his life. It may be said that two of these books, Pilgrim's Progress and De Foe's Essay on Projects, are among the most fertile books of all ages. In evidence it may be said that, except the Bible, Pilgrim's Progress is more freely read throughout the world than any other book, and De Foe's Essay on Projects contains intimations and projections of nearly all the most salutary reforms in morals, in law, and in practical ethics that have blessed the world since it was written.

It was his bookish inclinations which made him a printer, and to the end of his life he illustrated, whenever he had occasion to speak or write on such matters, how his training as a printer determined his ideas in education.

His mind was universal, and he was therefore interested in all human affairs. As a boy he took a peculiar interest in the drama, and throughout life was fond of the theater. On this mimic stage he saw the larger action of life epitomized, and from the conduct of the players on the stage he was doubtless able to draw conclusions of value to him in his large, diplomatic action. Throughout his works are constant references to the plays of the day, and he is fond of illustrating a letter to a friend by a passing remark on some popular piece. His boyhood was cast in the age of ballad mongery, and to the end of his days he enjoined that kind of scribbling. The petty vender of street ballads is the potent illustration in our day of the persistency of this kind of writing.

A bookish boy would make friends of bookish lads, and one John Collins, with whom he early became acquainted, enabled him to enter upon a new epoch in life—the epoch of conversation. Between these boys there were long controversies on the passing questions of the day, and the various theories in the projection of which youth is so fertile. Collins denied "the propriety of educating the female sex in learning and their abilities for study." Franklin took the opposite side and seems to have converted himself into an advocate of woman's education. This controversy, left unsettled in conversation, was carried on by correspondence, and Franklin thus began as a writer.

Three or four letters on a side had passed, he tells us, when his father happened to find the papers and read them. Without entering into the discussion, he took occasion to talk to his son about the manner of his writing; observed that, though he had the advantage of his antagonist in correct spelling and pointing (which young Franklin owed to the printing house), he fell far short in elegance of expression, in method, and in perspicuity, of which he convinced his son by several instances. Franklin saw the justice of his father's remarks, and thence grew more attentive to style in writing, and determined to improve his own.

This proof of his ability to compare himself with others is significant, for it illustrates one of the chief powers of his mind. He was quick to notice points of superiority or of inferiority, and, being ambitious to excel, proceeded in a practical way to overcome his deficiencies. His method became, in his opinion, the right procedure for all other persons in a similar condition, and it was later formulated by him as a method in education. It was in brief to imitate the best writings of the day. Happily for him Addison was then giving the Spectator to the world, and an odd volume, the third, fell into his hands. The reading of it produced a sensation new

Improves in composition.

to him; he read it again and again and was delighted, and he afterwards laid down the proposition that all children could derive the same benefit from the Spectator which he had derived.

His method was simple, yet original; it was to read the Spectator and to rewrite it from memory; to compare his version with the original, and to correct and rewrite it until his own composition was as perfect as that of Addison himself. This taught him the limitations of his own vocabulary, and led him afterwards to insert in his plan for the education of youth a provision for the study of the dictionary. In his Sketch of an English School he advises for the use of first or lowest class, to which children of the age at which he began reading the Spectator would belong, that "a vocabulary of the most usual difficult words might be formed with explanations, and they might daily get a few of those words and explanations by heart, which would a little exercise their memories; or at least they might write a number of them in a small book for the purpose, which would help to fix the meaning of those words in their minds and at the same time furnish everyone with a little dictionary for his future use."

His own boyish experiences taught him his need of a vocabulary, of his using the word exactly responsive to the thought, the best word that could be found. This opinion, formulated in the Sketch of an English School for the Consideration of the Trustees of the Philadelphia Academy, to which I shall again refer, was plainly the result of his experience in self-education; and when he tells us in his Autobiography that he made verses because their composition

Why he wrote verses.  
laid him under the constant necessity of searching for a variety of words and for words exactly suited to the thought, and that he turned tales into verse, and after he had forgotten the prose turned them back again, and in this manner, by comparing his work afterwards with the original, discovered his faults and amended them, we catch a glimpse of the value of comparison in education; that is, comparison made for practical purposes. So perfectly did this scheme work that, as he tells us in a delightful way, he sometimes had the pleasure of fancying that in certain parts of small import he had been lucky enough to improve the method or the language of the original, and this encouraged him to think that he might possibly in time come to be a "tolerable English writer."

To reach this height he was extremely ambitious, and to show how such a result was possible for anyone who, like himself, was an indented apprentice, he records that his time for making these exercises and for reading was at night after his work was done or in the morning before it began or even on Sundays when he was alone, and, as he rather disliked to attend church, he stayed at home and eased his conscience by perfecting himself in English style. Certainly the judgment of posterity has awarded him high rank in English composition. He takes pains to tell us how his self-education was a success and how all other people, if they choose, may educate themselves and become "tolerable English writers."

He soon discovered his ignorance of mathematics, and at 17  
He studies arithmetic and logic.  
was old enough to be ashamed of it. He overcame his deficiency as he had overcome that in composition. He took Cocker's Arithmetic and went through the whole by himself "with great ease." Not only arithmetic, but books of navigation (Seller's and Shermy's) were studied in the same manner, but having no practical use for the higher mathematics he never pursued them. About this time he read Locke On the Human Understanding, and the Art of Thinking, by Messrs. du Port Royal.

Intent on improving in language, he found an English grammar, Greenwood's, at the end of which "there were two little sketches of the arts of rhetoric and logic, the latter finishing with a specimen of a dispute in the Socratic method,"

and he soon afterwards procured Xenophon's Memorable Things of Socrates. He had made a discovery. Addison had charmed him, but Xenophon captivated him, and from Xenophon he learned the greatest lesson of his life. "From that time," says he, "I adopted it, dropped my abrupt contradiction and positive argumentation, and put on the humble inquirer and doubter."

Again and again from his Autobiography, and from other sources, we learn how, through his long life, he avoided dogmatic disputation and won his cause quite as much by his mastery of the art of doubting and questioning as by his powers of confutation. He was a born diplomat and his sense of the principles of diplomacy was thus early manifest. So important did the Socratic method become, in his ideas of education, that in drawing up his Proposals Relating to the Education of Youth in Pennsylvania, out of which grew the University of Pennsylvania, he encouraged all those studies which involve conversation and writing. He would acquaint youth with the best models among the ancients. But his diplomatic experience made him familiar with the feebleness of mere talk, and he concluded that as modern political oratory is chiefly performed by the pen and press, its advantages over the ancients in some respects ought to be shown, as, for instance, that its effects are more extensive and more lasting.

Thus he anticipated the age of books, newspapers, magazines, and the numerous productions of pen and press in later times, and was fully conscious of the enormous and superior power of the printed page over the spoken word; so from his own experience he advocated studies by which the human mind is most widely reached and most powerfully influenced. His own writings are frequently in the Socratic method.

In his Sketch of an English School he advocated the reading of short pieces by the master, not exceeding the length of a number in the Spectator, with the proper modulations of voice, due emphasis, and suitable action where action is required, and that the youth should imitate the manner of the original. The beauties of the piece were to be discussed by the instructor, and, from a variety of readings by which good styles of all kinds were made known, children should learn to imitate such excellence and be able readily to put their thoughts into the form best adapted to accomplish the end.

Having discovered the value of the Socratic method, he next discovered the value of expressing himself in terms of modest diffidence, and to the end of his life he was noted for the modesty with which he advanced his opinions. Perhaps no illustration of this quality is finer than his speech read to the convention of 1787 in its closing hours. Franklin himself was too feeble to deliver it, and his colleague, James Wilson, read it for him. Perhaps this speech gave us the Constitution of the United States:

I confess that there are several parts in this Constitution [said he] that I do not at present approve, but I am not sure that I shall never approve them; for, having lived long, I have experienced many instances of being obliged by better information or fuller consideration to change opinions, even on important subjects, which I once thought right, but found to be otherwise. It is, therefore, that the older I grow the more apt I am to doubt my own judgment and to pay more respect to the judgment of others. Most men, indeed, as well as most sects in religion, think themselves in possession of all truth, and that whenever others differ from them it is so far error.

And then he characteristically points his speech by a happy illustration. Steele, a Protestant in education, tells Pope—

that the only difference between our churches in their opinions of the certainty of their doctrines is that the Church of Rome is infallible and the Church of England is never in the wrong. But though so many private persons think almost as highly of their own infallibility as they do of their sect, few express it as naturally as a

certain French lady, who in a dispute with her sister said: "I do not know how it happens, sister, but I meet with nobody but myself that is always in the right"—*"il n'y a personne que moi qui a toujours raison."*

It is not often that the lessons of childhood regulate one's later life, but the Socratic method of Franklin's boyhood determined his whole later attitude toward public questions, and probably, more than any other characteristic of the man, made him the most successful diplomat that our country has had. Frequently, in addressing his younger friends, he laid down the lesson of modest diffidence as highly conducive to practical success in life. If we advance our sentiments too dogmatically—so ran his defense for this training—we may not only provoke contradiction, but prevent a candid attention. Thus he bases his philosophy of diffidence upon its utility.

The facility with which he undertook his self-education in literature and in mathematics characterizes all his after efforts in practical affairs. Throughout his Autobiography he is fond of mentioning the advantages of self-training. The principle which won success in rewriting a Spectator he applied in business, and soon detected its virtues in practical affairs. Like all self-educated men, his experience crystallized in maxims, some of which he formulated himself, but nearly all of which he took from the experience of mankind at large.

Like Daniel Webster, Franklin made great use of the labor of others, and it is interesting to note his account of the principles which influenced the course of his life.

My parents [he writes] had early given me religious impressions, and brought me through my childhood piously in the dissenting way. But I was scarce 15 when, after doubting by turns several points, as I found them disputed in the different books I read, I began to doubt of the revelation itself. Some books against deism fell into my hands. They were said to be the substance of the sermons which had been preached at Boyle's lectures. It happened that they wrought an effect on me quite contrary to what was intended by them, for the arguments of the deists which were quoted to be refuted appeared to me much stronger than the refutations; in short, I soon became a thorough deist.

His habit of doubting, and notably in cases involving difficulties which he could not overcome by an adequate reply, bred in him not only a love of experiment to test the nature of phenomena, but led him to remain in doubt when he was unable to obtain a satisfactory explanation. He was one of the greatest of experimentalists, and, as might be expected of one whose whole philosophy was utilitarian, his life is replete with apt illustrations of the utility of experiments, so that one of his biographers is able to give several pages to the mere enumeration of his discoveries, all of which were of a useful kind, such as the deliverance of mankind from smoky chimneys, the practical means of ventilation, numerous discoveries in electricity, the determination of the temperature of the Gulf Stream, the consumption by a fire of its own smoke, and the construction of water-tight compartments in ships.

So strong was his habit of observation that in his various journeys across the ocean, in the colonies, in Great Britain and Ireland, and on the Continent, he was always alert to detect not only the wants of the people in whatsoever region he was traveling, and the means for supplying those wants, but also to give minute attention to natural history, as when on his first voyage from Philadelphia to England, in 1726, being then in his twentieth year, he records in his journal changes in the color of dolphins, and experiments with them, living and dead, to determine the cause of the loss of their luster. A few days later he made observations on a shellfish found upon a floating weed in the Gulf Stream, and records that, in order to strengthen his conjecture, whether his opinions with respect to the development of this crea-

ture were true, he resolved to keep "the weed in salt water, renewing it every day till he came on shore, by this experiment to see whether any more crabs will be produced or not in this manner." His own powers of observation and comparison being of the highest order, he naturally imputed to the effects of such powers, when exercised by other men, many of the advantages which he himself derived from them. This doubtless led him in his Plan for the Education of Youth in Pennsylvania to encourage experimentation, that by instruction in mechanics men might be informed "of the principles of that art by which weak men perform such wonders, labor is saved, and manufactures expedited."

And again, touching agriculture, a subject which received careful attention from his eminent contemporaries, Washington and Jefferson, having affirmed that "natural history will also afford opportunities of introducing many observations relating to the preservation of health, which may be afterwards of great use," he added: "While the students are reading natural history, might not a little gardening, planting, grafting, and inoculating be taught and practiced, and now and then excursions made to the neighboring plantations of the best farmers, their methods observed and reasoned upon for the information of youth, the improvement of agriculture being useful to all and skill in it no disparagement to any?"

Let there be experiment.

We should not forget that the complexity and intensity of modern life compel a curriculum in technical instruction in our colleges and universities which could not possibly be called for in Franklin's time. He lived before the manufacturing epoch, before the age of rapid transportation and the application of electricity and steam to the wants of man, therefore we need not expect to find in his Proposals for the Education of Youth the equipment of a modern chemical, mechanical, or biological laboratory. In his time the chief occupation of Americans was farming, and he, like Washington and Jefferson, advocated all possible experiments which would improve this employment and greatly add to its productivity. But the principle by which he was animated was the same as that which, applied in later times, has equipped the best laboratories.

The first step in science is to doubt, and Franklin at 18 had taken that step. From his own reason and observation he began to formulate the principles or maxims of the moral world. An experimenter by birth, he was conventional in his manner both of acquiring and giving knowledge. He adapted himself to the conditions about him and escaped eccentricity, so that he was enabled to influence the world by his principles of life when another man, equally intellectual, but neglecting to adapt himself to the conventions of society, would have had no influence.

His sociology was founded on his conception of the general welfare, which to him was the great problem of life. It is to him we are indebted for the established use of the phrase "the general welfare."<sup>a</sup>

His large conception of humanity made him a citizen of the world, and his ideas of morality were founded upon his interpretation of the general welfare. "I grew convinced," says he, "that truth, sincerity, and integrity in dealings between man and man were of the utmost importance to the felicity of life, and I formed written resolutions, which still remain in my journal book, to practice them ever while I lived."

Observation had taught him the utility of virtue, and it may be said that, had there been no system of morality in the world when he was born, he would have evolved one—would have founded it upon experimentation, and his experimentation would have been based solely upon the doctrine of utility.

<sup>a</sup>For the history of this phrase, see my Constitutional History of the United States, 1765-1895, Vol. III, Book VI, Ch. VI.

We are not surprised to learn that revelation had little weight with him; that he believed that some actions should be forbidden because they are not beneficial to man, and that they should not be considered injurious to man because they are forbidden. In other words, all that promotes the general welfare is good; all that hinders it is bad. Yet his childhood's teaching had bred in him a belief in the existence of a God. To a primary conception that Divine Providence controls the destiny of the human race he joined the utilitarian doctrine that truth, sincerity, and integrity are virtues because they are of the utmost importance to the felicity of life; therefore in his Sketch of an English School he would have all lessons chosen for reading "contain some useful instruction whereby the understanding of youth may at the same time be improved." He would have Dr. Johnson's First Principles of Morality read by scholars in the fifth form, "and explained by the master, to lay a solid foundation of virtue and piety in their minds." And in his Proposals for the Education of Youth in Pennsylvania he remarks: "As to their studies, it would be well if they could be taught everything that is useful and everything that is ornamental. But art is long, and their time is short. It is therefore proposed that they learn those things that are likely to be most useful and most ornamental, regard being had to the several professions for which they are intended."

He would teach morality "by descanting and making continual observations on the causes of the rise and fall of any man's character, fortune, and power mentioned in history; the advantages of temperance, order, frugality, industry, and perseverance."

It is to be noticed that he valued temperance, order, and frugality, and the other virtues, as advantageous to the general welfare, and did not recommend the study of morality for its own sake. Because the virtues were so advantageous, he declared "the general natural tendency of reading good history must be to fix in the minds of the youth deep impressions of the beauty and usefulness of virtue of all kinds, public spirit, and fortitude."

Having laid down the proposition that virtue is advantageous and that it may be taught by examples from history, he turned to the subject of religion, and advocated its inclusion in the curriculum for the same reason that he had received it into his own philosophy. "History will also afford frequent opportunities of showing the necessity of a public religion from its usefulness to the public; the advantages of a religious character among private persons; the mischief of superstition, and the excellency of the Christian religion above all others, ancient or modern."

In other words, Franklin found religion in the world and he concluded that it is a necessary element in promoting and securing the general welfare. It should be observed because necessary; but, unlike Emerson, he would not have produced a system of religion had there been none in the world until his time. Having admitted by force of his own self-experimentation the necessity of religion in society, he deduced its usefulness to the public, and this giving occasion for another indulgence in comparison, he at once concluded that "the Christian religion above all others, ancient or modern, was the most excellent." Had Franklin been born in India, he probably would have advocated the religion of Buddha.

The notion that history affords frequent opportunities of showing the necessity of a public religion from its usefulness to the public, which is laid down in his Proposals for the Education of Youth in Pennsylvania of 1740, had been anticipated thirty years before, as he tells us in his autobiography. His observations

before his twentieth year having taught him the advantages to be derived from ingenious acquaintance, he organized the famous club in Philadelphia called the "Junto," which met on Friday evenings. He drew the rules for its procedure. Three classes of subjects

He founds the "Junto."

were to be discussed by the company—morals, politics, and natural philosophy—for these three comprehended all the utilities, and the wise understanding of the principles of them would contribute to the general welfare.

In making up the Junto he took men who were successfully engaged in the ordinary pursuits of life. There was a copier of deeds, a surveyor, a shoemaker, a mechanic, a merchant's clerk, several printers, and a "witty gentleman of fortune." He would have us believe that one common interest, the love of books, held these men together. The symbol of his philosophy of self-culture is a book. Franklin and Dr. Samuel Johnson were as little alike as any two men of their time in their ideas of politics and religion; but they were both self-educated men, and the means of their education was books. It was Dr. Johnson who said: "Read anything five hours a day and you will soon be learned." Franklin and Johnson were the two great men of the eighteenth century who owed their power and place in life to their love of books. Franklin would have agreed with Carlyle, that "the best university is the best collection of books."

The place of books in his scheme. The Junto at Philadelphia was the first book-loving, book-making, and book-collecting body of men in America, for out of its labors grew the Library Company of Philadelphia, which became the parent of all the circulating libraries of America. The place of books in Franklin's philosophy of culture is almost paramount. He recognized the lasting power of the printed page, and therefore, in his scheme for the instruction of children, he elaborates his theory of education in making provision for an exhaustive practice in composition and the reading of books. We must not forget that at the time when the Junto was formed the ability to read and write was not common in the colonies; there were no American libraries, and books were scarce and expensive.

Each of the six classes into which he divides his ideal school was chiefly engaged in composition and reading. His first, or lowest, class should read pieces such as Croxall's Fables, which were to be read aloud to them by the master and the difficult words explained. It was this class which was to exercise its memory by getting new words daily and by making a "little dictionary for future use." In the study of the Fables great care was to be taken for improvement in orthography by learning English grammar, and every effort was to be made to secure "good spellers very early." Like all printers, Franklin had a horror of bad spelling; "for it is a shame for a man to be so ignorant of this little art in his own language as to be perpetually confounding words of like sound and different significations." This was a child's first equipment—to understand a book.

Teach reading with attention. The second class was "to be taught reading with attention, and with proper modulations of the voice according to the sentiment and the subject." It is a pity so many teachers of our own day are almost in total ignorance of the inexpressible value to the child of understanding what he reads. One of the saddest errors in primary education is the omission to teach "reading with attention, and with proper modulations of the voice according to the sentiment and the subject."

The understanding of the lessons in the second class would require them to give an account, first, of the parts of speech and the construction of one or two sentences, which would oblige them to recur frequently to their grammar, and to fix its principal rules in their memories; "next, of the intention of the writer or the scope of the piece, the meaning of each sentence and of every uncommon word. This would early acquaint them with the meaning and force of words, and give them that most necessary habit of reading with attention." It was to this class that the master was to point out all the beauties and lessons of the selections. Variety of subject and style, in prose and verse, stories, sermons; the speeches of generals to their soldiers, which comprised the most interesting portions of Plu-

tarch's Lives, a book with which Franklin had become familiar in his boyhood; speeches in tragedy and in comedy, the mimic world which he loved; odes, satires, letters, and blank verse, all comprising the various equipment of the man who would express himself readily to his fellow-men, were to constitute the reading lessons.

A modern series of readers shows at a glance the world's opinion of Franklin's plan for the instruction of classes by well-chosen lessons for reading, and I venture to say that the one book in our public schools which conveys, or can be made to convey, the greatest amount of training is the reading book.

In order that the children might read with attention, Frank-

The value of read- lin required—  
ing as a study.

That they should first study and understand the lessons before they are put upon reading them properly, to which end each boy should have an English dictionary to help him over difficulties. When our boys read English to us we are apt to imagine they understand what they read, because we do, and because it is their mother tongue. But they often read as parrots speak, knowing little or nothing of the meaning. And it is impossible that a reader should give the due modulation to his voice, and pronounce properly, unless his understanding goes before his tongue and makes him master of the sentiment. Accustoming boys to read aloud what they do not first understand is the cause of those even, set tones so common among readers, which, when they have once got a habit of using, they find so difficult to correct, by which means among fifty readers we scarcely find a good one. For want of good reading pieces published with a view to influence the minds of men, for their own or the public benefit, lose half their force. Were there but one good reader in a neighborhood, a public orator might be heard throughout a nation with the same advantages, and have the same effect upon his audience, as if they stood within the reach of his voice.

Here, as ever, he bases his idea of culture upon the advantages to be derived in promoting the general welfare. He would have boys learn reading in order to understand human sentiment, and that it might influence them as if it had been spoken to them, for a book in his opinion had no right to exist unless it contributed to the public benefit.

The Junto was almost as advantageous to him and his associates as any university of the time could have been. His conception of the methods and possibilities of self-education was large, and the active interest which each member of the club showed in its prosperity demonstrated to him the advantage, in general education, of the same methods which made the Junto prosperous. Its controlling principle was that of self-interest; its rules and usages were evidently derived

Cotton Mather's from Franklin's recollections of Cotton Mather's benefit socie-  
benefit societies in ties. Mather had greatly influenced Franklin in youth and  
New England.

had originated a system of neighborhood guilds, or benefit societies, which were formed in the several Congregational churches directly under Mather's influence. These societies, to twenty of which Mather himself belonged, were organized for the purpose of promoting the general interests of religion in Massachusetts, and Mather had drawn up "certain points for consideration;" that is, rules or orders for the management and to indicate the scope of the organizations. The rules for the government of Mather's societies are interesting as the precedent for the rules of the Philadelphia Junto.

The "points of consideration" were the following:

Questions for de-  
bate.

1. Is there any remarkable disorder in the place that requires our endeavor for the suppression of it; and in what fair, likely way may we endeavor it?
2. Is there any particular person whose disorderly behavior may be so scandalous and so notorious that we may do well to send unto the said person our charitable admonitions? Or are there any contending persons whom we should admonish to quench their contentions?
3. Is there any special service to the interest of religion which we may conveniently desire our minister to take notice of?

4. Is there anything we may do well to mention unto the justices for the further promoting good order?

5. Is there any sort of officers among us to such a degree unmindful of their duty that we may do well to mind them of it?

6. Can any further methods be devised that ignorance and wickedness may be chased from our people in general, and that household piety in particular may flourish among them?

7. Does there appear any instance of oppression or fraudulence in the dealings of any sort of people that may call for our essays to get it rectified?

8. Is there any matter to be humbly moved into the legislative power to be enacted into law for public benefit?

9. Do we know of any person languishing under sore and sad affliction; and is there anything we may do for the succor of such an afflicted neighbor?

10. Has any person any proposal to make for our own further advantage and assistance, that we ourselves may be in a probable and regular capacity to pursue the intention before us?

In one of Mather's benefit societies Franklin, as a boy, had heard discussions of a practical character bearing upon the immediate concerns of life about him, and the impression on his mind was permanent. Instructed by this boyish experience, he in 1730 organized the Junto with a purpose similar to that of the societies—the improvement of its members and their fellow-citizens in virtue, knowledge, and practical wisdom. He did not seek to teach religion, but to encourage the acquisition of useful knowledge in morals, politics, and natural philosophy. The membership in the Junto was limited. A candidate must declare his love for mankind in general, his belief in freedom of thought, his love of truth for truth's sake, and his desire to obtain knowledge without prejudice, and, perhaps of chiefest importance, his willingness to communicate to others all kinds of useful information within his power.

The Junto met on Friday evenings and its rules illustrate Franklin's theory as to the impolicy of "abrupt contradiction and positive argumentation" and the wisdom of "modest diffidence" in "a humble inquirer and doubter." Therefore instead of prescribing dogmatic rules, or, as we would say, adopting a constitution and by-laws, the Junto at the opening of its meetings read twenty-four queries which, it will be noticed, may be grouped under the three headings of morals, politics, and natural philosophy. These queries were:

Order of business in the Junto. Have you read over these queries this morning, in order to consider what you might have to offer the Junto touching any one of them, viz:

1. Have you met with anything in the author you last read remarkable or suitable to be communicated to the Junto, particularly in history, morality, poetry, physic, travels, mechanic arts, or other parts of knowledge?

2. What new story have you lately heard agreeable for telling in conversation?

3. Hath any citizen in your knowledge failed in his business lately, and what have you heard of the cause?

4. Have you lately heard of any citizen's thriving well, and by what means?

5. Have you lately heard how any present rich man, here or elsewhere, got his estate?

6. Do you know a fellow-citizen who has lately done a worthy action deserving praise and imitation, or who has lately committed an error proper for us to be warned against and avoid?

7. What unhappy effects of intemperance have you lately observed or heard; of imprudence, of passion, or of any other vice or folly?

8. What happy effects of temperance, of prudence, of moderation, or of any other virtue?

9. Have you or any of your acquaintance been lately sick or wounded? If so, what remedies were used, and what were their effects?

10. Whom do you know that are shortly going on voyages or journeys, if one should have occasion to send by them?

11. Do you think of anything at present in which the Junto may be serviceable to mankind, to their country, to their friends, or to themselves?

12. Hath any deserving stranger arrived in town since last meeting that you have heard of? And what have you heard or observed of his character or merits? And whether, think you, it lies in the power of the Junto to oblige him, or encourage him as he deserves?

13. Do you know of any young beginner lately set up whom it lies in the power of the Junto any way to encourage?

14. Have you lately observed any defect in the laws of your country of which it would be proper to move the legislature for an amendment, or do you know of any beneficial law that is wanting?

15. Have you lately observed any encroachment on the just liberties of the people?

16. Hath anybody attacked your reputation lately; and what can the Junto do toward securing it?

17. Is there any man whose friendship you want and which the Junto or any of them can procure for you?

18. Have you lately heard any member's character attacked, and how have you defended it?

19. Hath any man injured you from whom it is in the power of the Junto to procure redress?

20. In what manner can the Junto or any of them assist you in any of your honorable designs?

21. Have you any weighty affair on hand in which you think the advice of the Junto may be of service?

22. What benefits have you lately received from any man not present?

23. Is there any difficulty in matters of opinion, of justice and injustice, which you would gladly have discussed at this time?

24. Do you see anything amiss in the present customs or proceedings of the Junto which might be amended?

This practical means for a liberal education was worked out by Franklin when he was but 21 years of age, and undoubtedly the advantages which he and his associates obtained from their discussions largely contributed to his success in life, and tended to shape all his ideas in education. If anyone would understand Franklin's idea of a school, let him examine the history of the Junto.

The times were productive of a different set of inquiries or questions for debate than would interest a modern debating society. We must not forget that the eighteenth century in America was the period of the determination of the theory of republican government, and the Junto discussed such political questions as tended to the definition of government. The political thinkers of the eighteenth century gave us the definition of our theory of the nature of government; the nineteenth century was spent in working out the theory of the administration of government. Some of the subjects discussed by the Junto were:

Can any one particular form of government suit all mankind?  
Junto questions.

How may the possession of the Lakes be improved to our advantage?

Some of the moral questions were:

Which is less criminal, a bad action joined with a good intention, or a good action done with a bad intention?

Should it be the aim of philosophy to eradicate the passions?

Can a man arrive at perfection in this life?

Which is best, to make a friend of a wise or good man that is poor, or of a rich man that is neither wise nor good?

Which of the two is the greatest loss to the country if they both die?

Of questions touching on natural philosophy?

Whence comes the dew that stands on the outside of a tankard that has cold water in it in the summer time?

Why does the flame of a candle tend upward in a spire?

And of questions of a practical turn, one suggestive of Franklin himself:

Would not an office of insurance for servants be of service?

Which is of interest when we think of the numerous companies which now

insure employers against loss by employees, and in other forms of the insurance of domestic service.

The Junto was limited to a membership of 12, and Franklin insisted on kindness of speech, good manners, and cheerfulness of debate, which were secured by common agreement, by the singing of songs, and by diversions of various kinds. The influence of this society on American life is felt to this day. America is probably the first country in the world in which debating societies have prospered among all classes of men, and they have tended to educate the American people in all sorts of subjects which have contributed, as Dean Stanley would have said, to the "education of after life." A volume might be written on the influence of debating societies on the American character.

I do not understand that Franklin would make a school a mere debating society, but an examination of his plan for six classes in an English school shows how the methods and ends of the Junto were ever present in his mind. The third class in his school was "to be taught speaking properly and gracefully, which is near akin to good reading, and naturally follows it in the studies of youth."

The scholars were to—

begin with learning the elements of rhetoric from some short system, so as to be able to give an account of the most useful tropes and figures. Let all their bad habits of speaking, all offenses against good grammar, all corrupt or foreign accents, and all improper phrases be pointed out to them. Short speeches from the Roman or other history or from the parliamentary debates might be got by heart and delivered with the proper action, etc. Speeches and scenes in our best tragedies and comedies (avoiding everything that could injure the morals of youth) might likewise be got by rote, and the boys exercised in delivering or acting them, great care being taken to form their manner after the truest models.

For their further improvement, and a little to vary their studies, let them now begin to read history, after having got by heart a short table of the principal epochs, as in chronology. They may begin with Rollin's Ancient and Roman histories and proceed at proper hours, as they go through the subsequent classes, with the best histories of our nation and colonies. Let emulation be excited among the boys by giving, weekly, little prizes or other small encouragements to those who are able to give the best account of what they have read, as to time, places, names, and persons, etc. This will make them read with attention and imprint the history well in their memories. In remarking on the history the master will have fine opportunities of instilling instruction of various kinds and improving the morals as well as the understandings of youth.

All this is in the spirit of the Junto, the book, the moral instruction, the debate; but there is more of the Junto also in—

The natural and mechanic history, contained in the *Spectacle de la Nature*, might also be begun in this class, and the subject should be continued through the subsequent classes by other books of the same kind; for, next to the knowledge of duty, this kind of knowledge is certainly the most useful as well as the most entertaining. The merchant may thereby be enabled better to understand many commodities in trade; the handicraftsman to improve his business by new instruments, mixtures, and materials; and frequently hints are given for new manufactures, or new methods of improving land, that may be set on foot greatly to the advantage of a country.

It is not strange that he should pronounce studies in natural history "the most useful as well as the most entertaining." He saw in them the possibilities of almost infinite improvement in manufactures and agriculture. His view of the industrial value of studies in natural history is remarkable, for at the time in which he wrote there were no manufactures in America. His broad generalization of the value of mechanics and natural history anticipates our present manufacturing age.

Throughout his life he was a scientific man, but he seems to have made all his experiments in science for utilitarian purposes; never pursuing them merely as pure science. The whole cast of his mind was utilitarian, and he advocated the study of "natural and mechanic history" in school because such studies would give hints "greatly to the advan-

Scientific schools anticipated.

tage of the country." The wisdom of his plan for including natural history, in its broadest meaning, in the course of study is significantly recognized in the later foundation, endowment, increase, and practical value of numerous technical schools. He anticipated the chief educational departure of modern times.

In the Junta were discussed many of the economic questions of the day, and one debate so interested him that in 1730 he elaborated the subject in a pamphlet entitled, *The Nature and Necessity of a Paper Currency*, a pamphlet of great importance practically at the time and in the history of political economy.

The organization of the Junta made known more clearly one of the wants of the time—a library. The members had a few books, their own personal property, but there were not enough books among them to meet their wants as a society. The meetings were first held in a tavern, one of the alehouses common in Philadelphia at the time, where the members assembled informally and brought such books as illustrated the subjects for debate. This seems to have suggested to Franklin the organization of a library for the use of the Junta. His suggestion was approved and a small room in a private house was hired for the use of the club and for the storage of its books. Some of the members complained that their books were misused and therefore took them home and deprived the Junta of them.

Books in 1731 were not like books at the present time, cheap, abundant, and of convenient size. The heavy folios of that time—and some of the original books of the Junta may now be seen in the Philadelphia Library—were not adapted to ease of reading while traveling. Franklin conceived of founding a permanent library, and with his usual sagacity he made it of common interest. A subscription was undertaken by which each subscriber should contribute 2 pounds sterling for the first purchase of books, and 10 shillings a year for the increase of the library. He had some difficulty in securing a sufficient list of members. Hiding himself under the signature "A number of friends," and following the ruling principle of "humble diffidence" of which he was so fond, he was at last able to see the affair going on smoothly, and in five months 50 names were obtained. A list of books was made out and an order to the value of 40 pounds was sent to London.

The books arrived in Philadelphia in October, 1732, and were placed in the room set apart for the use of the Junta; a librarian was appointed and the books were given out once a week. Franklin served as librarian for a time. The undertaking was a success, and donations were made to it of books, money, and curiosities. It grew rapidly, the company obtained a charter, and increased its membership to a hundred. As Franklin says: "This was the mother of all North American subscription libraries, now so numerous. It is become a great thing in itself, and continually goes on increasing. These libraries have improved the general conversation of the Americans, made the common tradesmen and farmers as intelligent as most gentlemen from other countries, and perhaps have contributed in some degree to the stand so generally made throughout the colonies in defense of their privileges."

When he describes the library as "a great thing in itself," he is emphasizing the cardinal doctrine of his educational system—the use of the right book. His scheme of culture embodies methodical instruction in a few selected books, which give the best thoughts of the best minds, conveyed to youth in the best manner; that is, in a natural manner. It is impossible accurately to measure the influence in America of this idea. If we measure it by the influence of libraries in our country, we might safely affirm that Americans are more indebted to Franklin for their education than to any other man. The large possibilities of his principles of self-culture are to be valued by their adaptability to the ever-growing wants of the people. It should

The use of the right book.

not be forgotten that the principle of the circulating library and the first principle of his scheme of education grew up in his mind from his own experience in self-education: in the reading of books when a child, in learning to write English correctly, in the organization of the Junto, in its debates on morals, politics, and natural philosophy, and in the necessary equipment for its debates—a library.

The Art of Virtue. His practical mind seems to have viewed morality as it viewed politics and natural philosophy—that by thinking, by experiment, by observation, and by practice, a man might arrive at moral perfection. It would be a gross neglect of Franklin's philosophy of education to omit an account of his Art of Virtue. We must not forget that he was born in New England; that his father and mother were members of the Old South Church, and that he himself was baptized there; that his earliest impressions were religious, and that his New England home was the home of an earnest and somewhat polemic Calvinism of rigid simplicity. The insistence of his parents upon a wholesome industry and practical morality, and their stern recognition of the "chief end of man," made an impression upon Franklin's character which was never effaced. His own account is clear on this point:

I had been religiously educated as a Presbyterian; but though some of the dogmas of that persuasion, such as the eternal decrees of God, election, reprobation, etc., appeared to me unintelligible, and I early absented myself from the public assemblies of the sect, Sunday being my studying day, I never was without some religious principles: I never doubted, for instance, the existence of a Deity; that He made the world and governed it by His providence; that the most acceptable service of God was the doing of good to man; that our souls are immortal, and that all crimes will be punished, and virtue rewarded, either here or hereafter.<sup>a</sup>

These I esteemed the essentials of every religion; and being to be found in all the religions we had in our country. I respected them all, though with different degrees of respect, as I found them more or less mixed with other articles, which without any tendency to inspire, promote, or confirm morality, served principally to divide us and make us unfriendly to one another.

Moral perfection. He therefore seldom attended public worship, though he had "an opinion of its propriety and of its utility when rightfully conducted," and he regularly paid his annual subscription for the support of the only Presbyterian meeting in Philadelphia. Viewing religion as "proper and useful" he conceived of it as he conceived of politics and natural philosophy, as a subject for investigation, improvement, and adaptation to the wants of man. He could not think of religion as being impossible of improvement. He identified religion and morality:

About this time I conceived the bold and arduous project of arriving at moral perfection; I wished to live without committing any fault at any time, and to conquer all that either natural inclination, custom, or company might lead me into. As I knew, or thought I knew, what was right and wrong, I do not see why I might not always do the one and avoid the other. But I soon found that I had undertaken a task of more difficulty than I had imagined. While my attention was taken up, and care employed in guarding against one fault, I was often surprised by another; habit took the advantage of inattention; inclination was sometimes too strong for reason. I concluded at length that the mere speculative conviction, that it was our interest to be completely virtuous, was not sufficient to prevent our slipping; and that the contrary habits must be broken and good ones acquired and established before we can have any dependence on a steady uniform rectitude of conduct.

In other words, he proposed to train himself in morality as The thirteen virtues defined. he had trained himself in English composition and arithmetic.

He therefore contrived a method of self-education in morals, drew up a catalogue of the virtues, and for the sake of clearness used "rather

<sup>a</sup>See the clause on a belief in a future state of rewards and punishments in the constitution of Pennsylvania of 1776 and of 1790, which Franklin was concerned in making. It is retained in the constitution of 1873, Article I, section 4.

more names, with fewer ideas annexed to each, than a few names with more ideas." These virtues were thirteen in number: Temperance, silence, order, resolution, frugality, industry, sincerity, justice, moderation, cleanliness, tranquillity, chastity, humility. The moral world to him was a region of experiment and he was the moral world. He proceeded to experiment with himself as he would experiment with electricity. Perhaps the originality and practical tendency of his mind was never better displayed than in his scheme for perfection in the Art of Virtue.

I made a little book in which I allotted a page for each of the virtues. I ruled each page with red ink so as to have seven columns, one for each day of the week, marking each column with a letter for the day. I crossed these columns with thirteen red lines, marking the beginning of each line with the first letter of one of the virtues, on which line and its proper column I might mark by a little black spot every fault I found upon examination to have been committed respecting virtue upon that day.

This little book is dated July 1, 1733, when Franklin was a little past 27 years of age, and from the specimens given we can read Franklin's progress in the "art of virtue" for one week. His scheme provided for a complete course in thirteen weeks and for four courses in a year, and taking a lesson from the gardener, who does not attempt "to eradicate all the bad herbs at once, which would exceed his reach and strength, but works on one of the beds at a time, and having accomplished the first, proceeds to a second," Franklin had hope that "by clearing successively my lines of their spots, till in the end, by a number of courses, I should be happy in viewing a clean book, after a thirteen weeks' daily examination."

This self-culture in virtue for self-improvement is on the same principle as Mather's societies and the Junto. Being a practical man, Franklin strengthened his little book with maxims and quotations—one from Addison's Cato, which he had doubtless learned years before in the Spectator, another from Cicero, and a third from the Proverbs of Solomon:

The Art of Virtue applied. Length of days is in her right hand, and in her left hand riches and honor. Her ways are ways of pleasantness, and all her paths are peace.

But not satisfied with mere quotation, he prefixed to his tables of examination for daily use a little prayer of his own composition, which in itself is a lesson in self-improvement in the Art of Virtue:

O powerful Goodness, bountiful Father, merciful Guide, increase in me that

wisdom which discovers my truest interest. Strengthen my resolutions to perform what that wisdom dictates. Accept my kind offices to thy other children as the only return in my power for thy continual favors to me.

His Art of Virtue was the art of promoting the general welfare by self-improvement and self-training in morals. He was a busy man, and found it troublesome to keep an ordinary book which must be renewed from time to time, and which, "by scraping out the marks on the paper of old faults to make room for new ones in a new course, became full of holes; I transferred my tables and precepts to the ivory leaves of a memorandum book, on which the lines were drawn with red ink, that made a durable stain, and on those lines I marked my faults with a black lead pencil, which marks I could easily wipe out with a wet sponge. After a while I went through one course only in a year, and afterwards only one in several years, till at length I omitted them entirely, being employed in voyages and business abroad, with a multiplicity of affairs that interfered; but I always carried my little book with me."

Whenever we read in Franklin's writings any reference to virtue, and he is constantly referring to the virtues, we must have in mind his Art of Virtue and his scheme for self-improvement in morality, for I suppose he thought it illogical for any individual to require a child to form habits of self-education in politics and natural history and not in morality. His scheme of culture was, after all, the practical application of Socrates's famous maxim, "Know thyself." Perhaps the time may come when Franklin's method of self-education in morality shall be the prevailing one in society, but it is hindered at present by the more popular vicarious method of moral improvement. If every man would make self-education in morals a matter of business we might be able to trace an influence of Franklin's Art of Virtue in our country as great as his influence in founding public libraries. Again and again through life he mentioned his intention of writing and publishing "a great and extensive project that required the whole man to execute," and this was to be a treatise on the Art of Virtue.

It was the consideration of this "great and extensive project," an adequate treatment of which he could not find in the books of the world, that he made some observations after one of his readings in the library, May 19, 1731:

His observations on his readings.

That the great affairs of the world, the wars, revolutions, etc., are carried on and effected by parties.

That the view of these parties is their present general interest, or what they take to be such.

That the different views of these different parties occasion all confusion.

That while a party is carrying on a general design, each man has his particular private interest in view.

That as soon as a party has gained its general point, each member becomes intent upon his particular interest, which, thwarting others, breaks that party into divisions and occasions much confusion.

That few in public affairs act from a mere view of the good of their country, whatever they may pretend; and tho' their actings bring real good to their country, yet men primarily considered that their own and their country's interest was united and did not act from a principle of benevolence.

That fewer still, in public affairs, act with a view to the good of mankind.

There seems to me at present to be great occasion for raising a United Party of Virtue, by forming the virtuous and good men of all nations into a regular body, to be governed by suitable good and wise rules, which good and wise men may probably be more unanimous in their obedience to than common people are to common laws.

I at present think that whoever attempts this aright, and is well qualified, can not fail of pleasing God, and of meeting with success.

If I understand these observations correctly, they signify that Franklin conceived of a moral order in the world. From that conception he made scientific

deductions, the most important of which was that the moral order will prevail if men understand the principles of the moral world. Therefore he would encourage all men to make self-improvement the basis of moral investigation. From the mass of these moral experiments the ruling principles of the moral world might be deduced. In this mental process we see the man of science.

When, in 1757, he had engaged passage to England in a New York packet ship, had embarked stores for himself and his son, and was waiting orders of the tedious Lord Loudoun, who delayed the sailing of the fleet more than three months, he had occasion to practice his "art of virtue," and illustrate all his capacity for patience and happiness. It was in describing this voyage in his Autobiography that he wrote:

It has been remarked, as an imperfection in the art of shipbuilding, that it can never be known till she is tried whether a new ship will or will not be a good sailer; for that the model of a good sailing ship has been exactly followed in a new one, which has proved, on the contrary, remarkably dull. I apprehend that this may partly be occasioned by the different opinions of seamen respecting the modes of lading, rigging, and sailing of a ship. Each has his system, and the same vessel, laden by the judgment and orders of one captain, shall sail better or worse than when by the orders of another. Besides, it scarce ever happens that a ship is formed, fitted for the sea, and sailed by the same person. \* \* \* Yet I think a set of experiments might be instituted, first, to determine the most proper form of the hull for swift sailing; next, the best dimensions and properest place for the masts, then the form and quantity of sails, and their position as the wind may be, and, lastly, the disposition of the lading. This is an age of experiments, and I think a set accurately made and combined would be of great use. I am persuaded, therefore, that ere long some ingenious philosopher will undertake it, to whom I wish success.

His observations on the sailing of ships illustrate his ideas in education: by frequent experiment, rules for the conduct of life should be deduced, and the dominant idea of all experimentation should be utility.

The idea of experimentation and the deduction of principles from it is the chief idea in his philosophy of education. He would have "natural and mechanic history" taught, because deductions might be made which would improve agricul-

ture and mechanics. He would have composition taught in his ideal school because "writing one's own language well is the next necessary accomplishment after good speaking. It is the writing master's business to take care that the boys make fair characters, and place them straight and even in the line; but to form their style and even to take care that the stops and capitals are properly disposed is the part of the English master. The boys should be put on writing letters to each other on any common occurrences and on various subjects, imaginary business, etc., containing little stories, accounts of their late reading, what parts of authors please them, and why; letters of congratulation, of compliment, of request, of thanks, of recommendation, of admonition, of consolation, of expostulation, excuse, etc. In these they should be taught to express themselves clearly, concisely, and naturally, without affected words or highflown phrases. All their letters to pass through the master's hand, who is to point out the faults, advise the corrections, and commend what he finds right. Some of the best letters published in our own language, as Sir William Temple's, those of Pope and his friends, and some others, might be set before the youth as models, their beauties pointed out and explained by the master, the letters themselves transcribed by the scholar.

Dr. Johnson's *Ethica Elementa*, or First Principles of Morality, may now be read by the scholars, and explained by the master to lay a solid foundation of virtue and piety in their minds. And as this class continues the reading of history let them now, at proper hours, receive some further instruction in chronology and in that part of geography (from the mathematical master) which is necessary to understand the

maps and globes. They should also be acquainted with the modern names of the places they find mentioned in ancient writers. The exercise of good reading and proper speaking still continued at suitable times.

His fifth class, for further improvement in composition, were  
Essays and logic. to continue writing letters, and, in addition, to begin writing—

Little essays in prose, and sometimes in verse, not to make them poets, but for this reason: That nothing acquaints a lad so speedily with variety of exercises as the necessity of finding such words and phrases as will suit the measure, sound, and rhyme of verse, and at the same time well express the sentiment. These essays should all pass under the master's eye, who will point out their faults and put the writer on correcting them. Where the judgment is not ripe enough for forming new essays, let the sentiment of a Spectator be given and required to be clothed in the scholar's own words; or the circumstances of some good story, the scholar to find expression. Let them sometimes be put on abridging a paragraph of a diffuse author; sometimes on dilating or amplifying what is wrote more closely. And now let Dr. Johnson's Noetica, or First Principle of Human Knowledge, containing a logic, or art of reasoning, etc., be read by the youth, and the difficulties that may occur to them be explained by the master. The reading of history, and the exercise of good reading and just speaking still continued.

This formula is an epitome of Franklip's own experience.  
Origin of Frank- He had written little essays in prose and sometimes in verse as  
lin's ideas. a boy, and had learned the art from his uncle, who was a prodigious maker of verses.

Franklin, while apprenticed to this brother in Boston, had written doggerel verses and street ballads which sold so well that he was persuaded of their value, but his passing inclination to become a poet was smothered by his father's sage remark, one that was characteristic of the whole Franklin family, that "poets were usually very poor people and died beggars."<sup>a</sup>

His plan for clothing the sentiments of the Spectator in the scholar's own words was based entirely on his own boyish acquaintance with that classic.

In his sixteenth year he had experienced the exquisite pleasure, and he often spoke of it tenderly more than half a century later, of seeing his first piece in print in the Boston Courant, and though it was not signed Benjamin Franklin it was his own, that is, as much his own as a paraphrase of a popular author could be. Under the signature of Silence Dogood he wrote a number of articles in which he criticised colleges and graduates of colleges, discussed childhood, marriage, and widowhood, and in affected words and highfown phrases delivered himself of his thought. These articles in the Courant were doubtless in Franklin's mind when he prescribed the kind of composition useful for the classes in his model school. He had educated himself in that way.

His scientific mind recognized the value of correct deductions and therefore logic took a primary place in his system of culture. His first class should be taught the English grammar rules; his second should construe the parts of speech and sentences and recur to the rules of grammar; his third should learn the elements of rhetoric; and his class should study the art of reasoning in Dr. Johnson's First Principles of Human Knowledge, because without practice in that art correct deductions in life could not be made. The introduction of logic into the list of studies was due not only to the tendency of his mind, but also to the results of his own experience.

At 15, soon after awakening to his own ignorance of figures, he read Locke's Human Understanding and the Art of Thinking, by Messrs. du Port Royal, books which evidently greatly aided him in the orderly examination of phenomena and in making correct deductions from his experiments. He says in drawing up his Art of Virtue that he found himself "incorrigible with respect to order," and

<sup>a</sup> See a specimen of Franklin's verses, page 132.

deficient in what might now be called system. One of the serious criticisms made of him while minister to France many years later was the confusion of affairs in his office. Self-study had revealed to him this defect, and doubtless one reason for the introduction of logic and the rules of grammar and rhetoric into the studies of childhood was to remedy in others the defect from which he had suffered himself.

It should be said of him that his scheme for self-culture in morality was the means of his own regeneration, and that after his Art of Virtue was clearly before his mind he was probably as free from faults as any man of his times. The utility of his ideas in morals was thus proved in his own life.

It was at this time that he prepared for his own use his Articles of Belief and Acts of Religion, a creed, a prayer book, and a litany, which, he tells us, he continued to use for twenty years. His practice of the Art of Virtue confirmed his opinion that, as the object of religion was to promote virtue, religion was useful to mankind, and that the sects of his times contributed on the whole to the happiness and virtue of their members. It should be remembered that Franklin lived during one of the great religious revivals of history under the preaching of Whitefield. It would be interesting to trace the influence of the revival of religion under Wesley and Whitefield upon the education of Americans.

The spread of Methodism in America and the founding of seminaries and colleges by that denomination present a pleasing subject for historical investigation.

Whitefield was better known to Franklin than to any other Franklin and American. The great preacher came to Philadelphia in 1739 and threw the whole city into a ferment. He was as unlike Franklin as Franklin was unlike Dr. Johnson. He found in Franklin a true friend, a genial host, and a publisher. Philadelphia was tolerant, and Whitefield had no difficulty in gathering an audience. Tradition tells us of the multitudes who thronged to hear the great preacher. Franklin was greatly moved by his eloquence, but was not persuaded to adopt his doctrines. It having been found inconvenient for the crowds who came to hear Whitefield to assemble in the open air, it was proposed to erect a building 100 feet long and 70 broad, which should be for the accommodation of inhabitants of the town who might care to hear any preacher on any subject.

Whitefield had changed the manners of Philadelphia. Franklin records how under the influence of his preaching "from being thoughtless or indifferent about religion it seems as if all the world were growing religious, so that one could not walk through the town in the evening without hearing Psalms sung in different families in every street."

The eloquence of Whitefield and the multitudinous demand of the people for accommodation to hear him were the occasion for the building of a suitable meeting house, which also became a few years later the first building used by the Academy of Philadelphia, later the College of Philadelphia, now the University of Pennsylvania.

Franklin's love of natural philosophy prompted him to use He experiments with Whitefield's voice. Whitefield's voice as the means of an experiment in acoustics.

He preached one evening from the top of the court-house steps, which are in the middle of Market street and on the west side of Second street which crosses it at right angles. Both streets were filled with his hearers to a considerable distance. Being among the hindmost in Market street, I had the curiosity to learn how far he could be heard by retiring backward down the street toward the river, and I found his voice distinct till I came near Front street when some noise in the street obscured it. Imagining then a semicircle, of which my distance would be the radius and that it were filled with auditors, to each of whom I allowed 2 feet, I computed that he might well be heard by more than 30,000. This reconciled me to the newspaper accounts of his having preached to

25,000 people in the fields and to the ancient histories of generals haranguing whole armies, of which I had sometimes doubted.<sup>a</sup>

This comment on Whitefield admits us into a closer knowledge of Franklin's self-education. In his provision for the lessons of the second class in the ideal school, he advised the use of lessons made up of parts of a sermon, or of a general's speech to his soldiers, and the wonderful voice of Whitefield proved to him that the great speeches made by generals to their soldiers, such as he had read in Plutarch's Lives, might have been heard by the army. I suppose that Whitefield was all the more interesting to Franklin because he illustrated some of the properties of sound and demonstrated that the speeches of Cyrus might have been heard by his troops.

For the sixth class Franklin prescribed a continuation of the preceding studies in "history, rhetoric, logic, moral, and natural philosophy, the best English authors \* \* \* as Tillotson, Milton, Locke, Addison, Pope, Swift, the higher papers in the Spectator and Guardian, the best translations of Homer, Virgil, and Horace, of Telemachus, the Travels of Cyrus, etc."

The hours of the day were to be divided and disposed in such a manner that some classes might be "with the writing master, improving their hands, others with the mathematical master, learning arithmetic, accounts, geography, use of the globes, drawing, mechanics, etc., while the rest are in the English school, under the English master's care." Here is the substance of the working programme familiar in its development to all teachers at the present time.

It will be noticed that Franklin mentions drawing as a study for the sixth class. In this he anticipated one of the most important elements of modern education. By restful alternation in the order of the studies, he anticipated the programme of our technical training schools which divide the school day between literary study (language, mathematics, history, science, etc.) and the industrial studies (free hand, machine, and architectural drawing, wood working, smithing, etc.), indeed Franklin's scheme for the education of youth anticipates the ideas of the modern supporters of manual training.

Throughout his plan he develops a system of incentives to excellence. Speaking of the first class, he says improvement in spelling "perhaps \* \* \* is best done by pairing the scholars; two of those nearest equal in their spelling to be put together. Let these strive for victory, each propounding ten words every day to the other to be spelled. He that spells truly most of the other's words is the victor for that day; he that is victor most days of the month to obtain a prize, a pretty, neat book of some kind, useful in their future studies."

The system of prizes was a favorite one with him;<sup>b</sup> he thought that it "fixes the attention of the children," and he continually refers to it throughout his life. In dealing with men he acted upon the principle of incentive to action. As the highest encouragement to the classes he suggested that—

Once a year let there be public exercises in the hall, the trustees and citizens present. Then let fine gilt books be given as prizes to such boys as distinguish themselves and excel the others in any branch of learning, making three degrees of comparison, giving the best prize to him that performs best, a less valuable one to him that comes up next to the best, and another to the third, commendations, encouragement, and advice to the rest, keeping up their hopes that by industry they may excel another time. The names of those that obtain the prize to be yearly printed in a list.

"Fine gilt books." The intimate knowledge of human nature which is illustrated in this little scheme shows how much he had learned in the

<sup>a</sup>It is said that some words uttered by Whitefield were distinctly heard by people across the Delaware.

<sup>b</sup>He incorporated in his will a provision for prizes in the public schools of Boston.

printing business—that “fine gilt books” are often more popular simply because of their binding and style rather than for their contents. The material success of subscription publications attests the accuracy of this discrimination. He would appeal to the eye as well as to the “understandings of youth.” His division of the prizes into three classes and the publication of the names of the winners suggests that in educational matters he would apply the fundamental principles at the base of Adam Smith’s Economics, that every man will most willingly pursue his own substantial interest.

He had learned by experience the power of incentives in study. Soon after the projection of his *Art of Virtue* he became dissatisfied with the mere reading of books and began the study of languages. He had long been fond of chess, and he combined his love of language and of chess by fixing a condition of the game that “the victor in every game should have a right to impose a task, either in parts of the grammar, to be got by heart, or in translations, etc., which tasks the vanquished shall perform upon honor before our next meeting. As we played pretty equally, we thus beat one another into that language.”

He took up the study of languages as he had taken up arithmetic and English composition and taught himself. In attempting to learn the modern languages his attention was called again to the Latin tongue, which he had studied in an elementary way in his childhood for one year.

But when I had attained an acquaintance with the French, Italian, and Spanish, I was surprised to find on looking over a Latin Testament that I understood so much more of that language than I had imagined, which encouraged me to apply myself again to the study of it, and I met with more success, as those preceding languages had greatly smoothed my way. From these circumstances, I have thought that there is some inconsistency in our common mode of teaching languages. We are told that it is proper to begin first with the Latin, and having acquired that, it will be more easy to attain those modern languages which are derived from it; and yet we do not begin with the Greek, in order more easily to acquire the Latin. It is true that if you can clamber and get to the top of a staircase without using the steps, you will more easily gain them in descending; but certainly, if you begin with the lowest, you will with more ease ascend to the top; and I would therefore offer it to the consideration of those who superintend the education of our youth, whether, since many of those who begin with the Latin quit the same after spending some years without having made any great proficiency, and what they have learned becomes almost useless, so that their time has been lost, it would not have been better to have begun with the French, proceeding to the Italian, etc.; for though, after spending the same time, they should quit the study of languages and never arrive at the Latin, they would, however, have acquired another tongue or two, that, being in modern use, might be serviceable to them in common life.

This observation is the substance of all discussion made since Franklin’s day of the subject of teaching modern languages. He arrived at his opinions by his own experience, and incorporated them in his *Plan for the Education of Youth in Pennsylvania*, repeatedly referred to them, and defended them in one of the last papers of his life.

In his *Proposals Relative to the Education of Youth in Pennsylvania*, written in 1749, he had something to say of the study of language which did not exactly conform to his earlier ideas concerning the study of modern languages. In 1733 he had arrived at his conclusions of the superior advantages of the study of modern languages, even to the exclusion of Greek and Latin, by his own self-education in French, Italian, and Spanish. His *Proposals* were written sixteen years later, and the departure from his own opinion on the study of languages set forth in the *Proposals* is to be attributed to the necessary compromise which he found that he had to make in order to get the Philadelphia Academy founded.

In commenting on his plan for an English school, he said:

Thus instructed, youth will come out of this school fitted for learning any business, calling, or profession, except such wherein languages are required; and, though unacquainted with any ancient or foreign tongue, they will be masters of their own, which is of more immediate and general use, and withal will have attained many other valuable accomplishments; the time usually spent in acquiring those languages, often without success, being here employed in laying such a foundation of knowledge and ability as, properly improved, may qualify them to pass through and execute the several offices of civil life with advantage and reputation to themselves and country.

His plan for an English school contains ideas of a universal scheme of education applicable to such a country as ours. It should not be inferred that he was unfriendly to higher education. He knew very well the practical importance of public enlightenment, and, in providing for the general instruction of all children of the land, he would introduce those subjects and methods which would conduce to the largest public utility. We must not forget that in Franklin's time free public schools were not thought of,<sup>a</sup> that no minister of state or legislator had formulated a scheme of general education at public expense, but that education was still an individual affair, and the means for pursuing it existed only in private schools.

At 33 Franklin was continuing his self-education by making researches in natural history. In his Proposals for the Education of Youth he advised that "now and then excursions be made to the neighboring plantations of the best farmers, their methods observed and reasoned upon for the information of youth; that natural history will also afford opportunities of introducing many observations, etc."

He was himself a close observer, and like all great men who have advanced science, he made his observations with the assistance of simple and inexpensive instruments. In the possession of the University of Pennsylvania and of the Franklin Institute there are some portions of his electrical apparatus, the simplicity of which surprises the student in the modern electrical laboratory and leads him almost to underrate the services of Franklin to science. Franklin's self-education taught him to make use of the phenomena in nature, as he made use of the labors of other men, to swell the mass of his own knowledge.

The story of the ants, told by Professor Kalm, illustrates this practical method of scientific investigation: Franklin put an earthen pot, filled with molasses, into a closet, into which the ants soon found their way and began devouring the sweet. Franklin, observing this, removed the pot and suspended it by a string to a nail in the ceiling of the room, leaving a single ant in the pot. When its hunger was satisfied it tried to go home and, after many efforts, found its way up the string, across the ceiling to the wall, and thus to the ground. By half an hour Franklin saw a swarm of ants issuing from the ground, climbing the wall, crossing the ceiling, creeping down the string, and eating the molasses, one line coming and one line going until the molasses was all consumed.

This little story, which some of us remember in our school books, illustrates Franklin's method of investigating the habits of insects, a method as simple as his experiment with the kite. In his scheme for education he made no provision for elaborate physical apparatus. There is no reference to laboratories and it seems as if his ideas lacked the essentials of education in modern times. This hasty conclusion is corrected when we reflect on the education which Franklin

<sup>a</sup> An important and, in its influence, a far-reaching exception is to be made for New England. See account of John Adams's plan for public education and the constitution of Massachusetts, 1780, pages 163-165.

himself received and was making all through life. He knew nothing of elaborate physical apparatus; nature was his laboratory, observation and experience his teachers, and he relied upon these as the best means for the education of others. Ambition stimulated him to gain knowledge and he reasoned that it would stimulate others.

It has sometimes been asked whether the elaborate apparatus in modern education does not weight heavily in the hands of youth, and whether many of them are unable to see the principles on account of the apparatus.

The utilitarian ends which Franklin proposed are generally traceable to his own experience. His loss from the bad book-keeping of the deputy postmaster-general of the colonies led him to "mention it as a lesson to those young men who may be employed in managing affairs for others, that they should always render accounts and make remittances with great clearness and punctuality; the character of observing such a conduct is the most powerful of recommendations to new employments and increase of business."

A word frequently used by him is "business." It should be remembered that he viewed education from the vantage ground of the man of affairs who had never received the conventional training of the schools. He saw in industry and business the chief occupation of the mass of the people. Schools, he thought, should contribute to the advantage of this industry and this business.<sup>a</sup> He would make the transition from school life to the life of business easy and natural, and his chief defense for his proposed school was that there such a foundation of knowledge and ability might be laid as, properly improved, would qualify boys to "pass through and execute the several offices of civil life with advantage and reputation to themselves and country."

It is not to be understood that by "the offices of civil life" Franklin meant merely political offices. He uses the term "civil life" comprehensively, meaning the occupations of the citizen. Had he meant political preferment he would have used the phrase "public affairs."

He conceived of the school as a foundation for improvement in the pupil by the pupil himself. His own life was a continuous self-education. Practical wisdom was his aim. We find nowhere in his writings that modern phrase, "the completion of education." He makes no provision for any such limitation or standstill.

He was a native of Boston and never forgot his native town. Once in ten years he revisited that beloved spot and refreshed himself with the renewal of old acquaintances and associations. He frequently refers to his New England training, and it stood him in good stead through life. There are not wanting reminiscent touches, however.

I had, on the whole, abundant reason to be satisfied with my being established in Pennsylvania. There were, however, two things that I regretted, there being no provision for defense, nor for the complete education of youth; no militia, nor any college. I therefore, in 1743, drew up a proposal for establishing an academy,<sup>b</sup> and at that time, thinking the Rev. Mr. Peters, who was out of employ, a fit person to superintend such an institution, I communicated the project to him; but he, having more profitable views in the service of the proprietaries which succeeded, declined the undertaking, and, not knowing another at that time suitable for such a trust, I let the scheme lie awhile dormant. I succeeded better the next year, 1744, in proposing and establishing a philosophical society.

Meanwhile the prospects of war between England and France delayed academic

<sup>a</sup> The numerous economic and business schools of our day are founded on this idea.

<sup>b</sup> See the Proposals, pp. 182-185.

matters. His activity in the public defense having pleased the governor and council, he remarks with evident pride:

They took me into confidence, and I was consulted by them in every measure wherein their concurrence was thought useful to the association. Failing to obtain the cooperation of the middle colonies, and calling in the aid of religion, I proposed to them the proclaiming a fast to promote reformation, and implore the blessing of Heaven on our undertaking. They embraced the motion; but, as it was the first fast ever thought of in the province, the secretary had no precedent from which to draw the proclamation. My education in New England, where a fast is proclaimed every year, was here of some advantage. I drew it in the accustomed style; it was translated into German, printed in both languages, and divulged through the province. This gave the clergy of the different sects an opportunity of influencing their congregations to join in the association, and it would probably have been general among all but Quakers if peace had not soon intervened.

His confession that he proposed a fast because of the obvious advantages to be derived from it is a comment on his theory of morality. Had any other equal means of winning public favor been suggested by his New England training, he would have weighed the relative advantages and given his decision accordingly, for he tells us that he was accustomed when considering two courses of action to set down in columns the pros and cons of the question.

His motion, made years later, for prayers in Congress, was doubtless made to secure the advantages which he supposed would be attached to them in the public mind.

He again proposes an academy. Peace being concluded, and the association business therefore at an end, I turned my thoughts again to the affair of establishing an academy. The first step I took was to associate in the design a number of active friends, of whom the Junto furnished a good part. The next was to write and publish a pamphlet entitled *Proposals relating to the Education of Youth in Pennsylvania*. This I distributed among the principal inhabitants gratis; and as soon as I could suppose their minds a little prepared by the perusal of it, I set on foot a subscription for opening and supporting an academy. It was to be paid in quotas yearly for five years. By so dividing it I judged the subscription might be larger, and I believe it was so, amounting to no less, if I remember right, than £5,000.

In the introduction to these proposals I stated their publication, not as an act of mine, but of some public-spirited gentlemen, avoiding as much as I could, according to my usual rule, the presenting myself to the public as the author of any scheme for their benefit.

The subscribers, to carry the project into immediate execution, chose out of their number 24 trustees, and appointed Mr. Francis, then attorney-general, and myself to draw up constitutions for the government of the academy, which being done and signed, a house was hired, masters engaged, and the schools opened, I think, in the same year, 1749.

The scholars increasing fast, the house was soon found too small, and we were looking out for a piece of ground, properly situated, with intention to build, when Providence threw into our way a large house ready built, which with a few alterations might well serve our purpose. This was the building before mentioned, erected by the hearers of Mr. Whitefield, and was obtained for us in the following manner:

It is to be noted that the contributions to this building being made by people of different sects, care was taken in the nomination of trustees, in whom the building and ground was to be vested, that a predominancy should not be given to any sect, lest in time that predominancy might be a means of appropriating the whole to the use of such sect, contrary to the original intention. It was therefore that one of each sect was appointed, viz, one Church of England man, one Presbyterian, one Baptist, one Moravian, etc.; those, in case of vacancy by death, were to fill it by election from among the contributors. The Moravian happened not to please his colleagues, and on his death they resolved to have no other of that sect. The difficulty then was how to avoid having two of some other sect by means of the new choice.

Several persons were named, and for that reason not agreed to. At length one

mentioned me, with the observation that I was merely an honest man, and of no sect at all, which prevailed with them to choose me. The enthusiasm which existed when the house was built had long since abated, and its trustees had not been able to procure fresh contributions for paying the ground rent, and discharging some other debts the building had occasioned, which embarrassed them greatly. Being now a member of both sets of trustees, that for the building and that for the academy, I had a good opportunity of negotiating with both, and brought them finally to an agreement by which the trustees for the building were to cede it to those of the academy, the latter undertaking to discharge the debt, to keep forever open in the building a large hall for occasional preachers, according to the original intention, and maintain a free school for the instruction of poor children. Writings were accordingly drawn, and on paying the debts the trustees of the academy were put into possession of the premises, and by dividing the great and lofty hall into stories, and different rooms above and below for the several schools, and purchasing some additional ground, the whole was soon made fit for our purpose, and the scholars removed into the building. \* \* \*

The academy became the university. by a charter from the governor; their funds were increased by contributions in Britain and grants of land from the proprietaries, to which the assembly has since made considerable addition; and thus was established the present University of Philadelphia.<sup>a</sup> I have been continued one of its trustees from the beginning, now near forty years, and have had the very great pleasure of seeing a number of the youth who have received their education in it distinguished by their improved abilities, serviceable in public stations, and ornaments to their country.

Shall Latin and Greek be taught? In his plan for the education of youth in Pennsylvania he outlined his ideas of university training, but all the parts of the proposals were not wholly according to his liking. He discovered that his idea of an English school would not win the financial support of all the subscribers. Many of them thought that provision should be made for the study of the ancient languages, and to gain the support of these men Franklin, in the spirit of compromise, inserted this clause:

When youth are told that the great men, whose lives and actions they read in history, spoke two of the best languages that ever were, the most expressive, copious, beautiful; and that the finest writings, the most correct compositions, the most perfect productions of human wit and wisdom are in those languages, which have endured for ages, and will endure while there are men; that no translation can do them justice, or give the pleasure found in reading the originals; that those languages contain all science; that one of them is become almost universal, being the language of learned men in all countries, and that to understand them is a distinguished ornament, they may be thereby made desirous of learning these languages, and their industry sharpened in the acquisition of them. All intended for divinity should be taught Latin and Greek; for physick, the Latin, Greek, and French; for law, the Latin and French; merchants, the French, German, and Spanish; and though all should not be compelled to learn Latin, Greek, or the modern foreign languages, yet none that have an ardent desire to learn them should be refused, their English, arithmetic, and other studies absolutely necessary, being at the same time not neglected.

Translations vs. the original. To strengthen his defence of English studies he wrote at this time the Sketch of an English School, which was printed as a pamphlet at his press, but did not receive much attention. At the opening of the academy Mr. Peters preached a sermon which was favorably received and printed in pamphlet form at Franklin's press. With characteristic sagacity Franklin sewed together his pamphlet, A Sketch of an English School, with Mr. Peters's sermon, and so got his notions before the public. Forty years after the foundation of the academy, and two years before his death, he wrote his Observations relating to the Intentions of the Original Founders of the Academy in Philadelphia, in which he elaborated his early ideas of education. He anticipated the revolt against the classics which has come in our day, and which has

<sup>a</sup>This institution became the University of Pennsylvania in 1779. (See act of assembly, Nov. 27, 1779, creating the corporation.)

relegated Latin and Greek into the region of the dead. It is not inexpedient to say that his idea of studying only such languages as will be of utility to those who pursue them is the correct principle in this department of education. In conformity with his notion we have the modern elective course, which is the practical result of his challenge of the advantage and utility of compelling all persons who pursue higher education to pursue the same subjects in the same way for different ends. It will be noticed that there is a touch of humorous satire when he writes in a spirit of compromise that "no translations can do the finest writings in Latin and Greek justice" or give the "pleasure found in reading the originals," and that these languages "contain all science." It should not be forgotten, however, that he owed his fame to the publication of his electrical investigations in the Latin tongue as well as in French, Spanish, and Italian.

When he pleaded for the study of modern languages and the relegation of Latin and Greek to a secondary place he was confronting and challenging the scholastic world. The first struggle between the old system and Franklin's ideas of the new education occurred in Philadelphia in the very institution which he had been instrumental in founding, and the story of that struggle was told by Franklin himself two years before his death.

The education of orphans. It will be noted that in his plan of a school there was a provision for the education of poor children. The doctrines of equity regulated his ideas of charity. His *Hints for Consideration Respecting the Orphan Schoolhouses in Philadelphia* formulate the large experience of his life in charitable matters. He laid down the controlling principles for such an institution as follows: (1) That the institution be regularly inspected; (2) that the labor of the orphans should not be made for the profit of the establishment; (3) that an account should be opened with each orphan, crediting him with his labor and debiting him for the maintenance of his education; (4) that at his discharge, on coming of age, his accounts should be balanced and he should be urged and in honor bound to pay any indebtedness, and he should receive any credit due him; (5) that upon leaving the institution he should receive decent clothing, some money, and if deserving, a certificate of good behavior; (6) that the institution should aid him in entering upon a business or securing a position in life. Stephen Girard seems to have been influenced by these principles in founding Girard College, but it is doubtful whether Franklin would have limited the benefits of this charity to persons of the white race.

## II.

### THE PRACTICE OF THE ART IN A DEMOCRACY.

At 33 Franklin had become, by the application of his own maxims, a man of independent fortune, much respected by his neighbors and of good reputation throughout the colonies. There had been a long and bitter dispute in Pennsylvania respecting the rights of the proprietaries and of the assembly, chiefly turning upon the question whether the estates of the Penns should be taxed like other realty in the province. He had earnestly and efficiently advocated the rights of the assembly, and it was as its representative that he went to England in 1757.

Franklin educates the colonies. "It was Franklin," says one of his biographers, "who chiefly educated the colonies in the knowledge of their rights. He did this in many ways—by his *Junto*, by his newspaper, by his conversation, by the libraries founded through him, by the taste for science which he communicated, but especially by the ardor and ability with which he waged this long warfare against arrogant stupidity embodied in the degenerate offspring of William Penn."

His experiments in electricity had already been recognized in England and France, and he was included among the literary and learned men of the time. Defects in his education were never suspected by the academic world that sought his society.<sup>a</sup> He was a genius in his capacity for reading, was a good listener, easy in his manners, gay and witty, and never sought to indulge the company with "flashes of silence." No sooner had he settled in London as colonial agent than his instinct to effect improvements showed itself. The smoky street lamps and filthy streets of the city were the objects of his attention.

It is not my purpose to write a biography of Franklin, nor even to catalogue his experiments, but only to outline the utilitarian character of the man and his ideas.

The conduct of the ministry toward him afforded him an opportunity to travel, and in 1757 he visited Scotland, where the University of St. Andrews conferred upon him the title of doctor of laws, by which he was ever familiarly known. In Edinburgh he met Hume, Robertson, and Lord Kames, and it is thought by one of his biographers that one of his remarks to Dr. Robertson "suggested the well-known Macaulayan image of the New Zealander sitting upon the arch of London Bridge contemplating the ruin of St. Paul's."

He educates Eng- But he was engaged in a larger service for his countrymen  
land also. than making the favorable acquaintance of eminent men. He was writing and printing pamphlets on the American colonies for the enlightenment of the English public. The dark and dreary night of English opinion at that time respecting America seemed impervious to the beams of Franklin's genius, and he succeeded but feebly at first in piercing it; but the rays of his intelligence at last fell upon fertile soil, and there sprang up a liberal party in the Kingdom, which at last laid hold of the Government and compelled the acknowledgment of American independence.

The usefulness of Franklin at this time may be understood by any who choose to read his numerous pamphlets and his more numerous letters. His farsightedness is illustrated in one of his cherished opinions, expressed to Lord Kames, "that the foundations of the future grandeur and stability of the British Empire lie in America." He opposed the restoration of Canada to the French, saying: "If we keep it, all the country from the St. Lawrence to the Mississippi will in another century be filled with British people; Britain itself will become vastly more populous; by the immense increase of its commerce the Atlantic Sea will be covered with your trading ships, and your naval power, thus continually increasing, will extend your influence round the whole globe, and awe the world."

He ever believed and labored to effect that Canada and the thirteen colonies should comprise a political unit, and it was only by a blunder of his colleagues in Paris, when the final treaty of peace was made in 1783, that the United States did not include Canada.

Examined before Perhaps the most telling lesson which he imparted to the  
the House of Com- British public was his examination before the House of Com-  
mons. mons in 1765. For the first time England received true information of the state of the colonies, and the information was conveyed to the masters of England. The examination was by no means an accidental or impromptu affair. Nearly all the questions and answers were arranged beforehand by Franklin and his friends among the Liberal members of Parliament. This lawyer-like proceeding does not affect the value of the evidence. By timely shaping the examination he concentrated, during the brief period he was before the House, all possible information that could be elicited from the man best

<sup>a</sup>Instance the honorary degrees he received from William and Mary College, St. Andrews, Oxford, and Cambridge.

informed in the affairs of the colonies. Franklin was at home in the subject and played the first part in the most Socratic dialogue in parliamentary history. The whole examination was after Franklin's own heart and singularly in keeping with his own self-education. Experience and observation equipped him for the task, and his triumph is the proof of the excellence of his method.<sup>a</sup>

He had a unique method of educating the British public and he had learned it in his apprentice days in Boston and during the long struggle between the assembly and the proprietaries in Pennsylvania. The method is characteristic of all his political writings. It was briefly to set the whole question in dispute in a humorous light, by which the reader might see his way to the true conclusion; that is, the conclusion which Franklin wished to draw. This method of political enlightenment is unquestionably good in journalism and pamphleteering, and has its uses in bookmaking and public speaking, but Franklin's tendency to indulge in humor, it is said, excluded him from being asked by his contemporaries to write any of the great state papers with which he was, in one way or another, concerned. It would hardly do to put a joke into the Declaration of Independence. His English pamphlets are exquisite political hits, of which two are particularly famous. His *Rules for Reducing a Great Empire to a Small One*, Presented to a Late Minister (Lord Hillsboro, when he entered upon his ministry), and *An Edict of the King of Prussia*. These show one phase of his genius at great advantage. He was the first American humorist.

He was aware that public opinion is won and controlled by the most delicate and yet by the broadest manipulation, and that if he could win for America the favorable opinion of the British public an American party would ultimately control the votes of the House of Commons. By this procedure he showed the practicality of his mind; he appealed to the power in England which makes and unmakes ministries.

In appealing to this power he did not proceed blindly by addressing merely humorous and ephemeral newspaper articles to the general reader. He wrote masterly articles for the education of the public, and more, he became the companion of the first literary and scientific men of England, and won many of them to the support of his liberal ideas, not by formal discussion of the rights of the colonies, but by exemplifying in his own character and appointments the nature of the institutions which could produce such a man as he. It is not difficult for us to realize how he thus became the typical American and won respect for America by winning respect for himself. One of his services to his country was in the experimental proof that the human race does not degenerate in America.<sup>b</sup>

We must not forget that he appeared in the drawing rooms of London when it was a common doubt in English society whether Americans were white or black, whether they dressed in skins or wool, whether they spoke English or Indian, whether they lived in houses or wigwams, and whether Philadelphia was in Pennsylvania or Pennsylvania in Philadelphia.

Among his friends in England were Adam Smith, who at the time Franklin met him was writing his classic work, *The Nature and Cause of the Wealth of Nations*, and David Hume, the well-known author of a history of England and of essays in politics and philosophy. Adam Smith, when writing his *Wealth of Nations*, was in the habit of bringing the chapters, as he composed them, to Franklin, to Dr. Price, and others of the literati, then patiently hearing their observations and profiting by their discussions and criticisms, sometimes rewriting whole chapters after con-

<sup>a</sup> See the Examination in Bigelow's edition of his works, vol. 3, p. 407.

<sup>b</sup> The later incident of the six tall Americans and the six short Frenchmen together at dinner is in point.

ference and even reversing some of his propositions. Hume writes to Adam Smith in 1776: "Your work is probably much improved by your last abode in London." Parton has pointed out that Franklin's papers at this period "contain sets of problems and queries, as though agitated at some meeting of philosophers for particular consideration at home." All students of political economy have long known that Smith's *Wealth of Nations* is the first book that illustrates its propositions by examples from America. Smith was working out a new system of economics. In seeking a field for the application of his ideas it was natural that he should refer to America, a new country, as the region where they might have a practical test.<sup>a</sup>

It is known that the *Wealth of Nations* had great influence in centering the attention of Europe upon America. It is also known that the statesmen who cooperated in the formation of the United States—Franklin, Washington, Jefferson, Madison, Hamilton, Jay, Morris, and others—were acquainted with the teachings of Adam Smith. The *Wealth of Nations* had a most important influence in the organization of government in America in the critical years from 1776 to 1789. The doctrines of Smith are traceable in the debates of the Constitutional Convention of 1787, and references to the influence of the *Wealth of Nations* are scattered through the works of the statesmen of the period. Monroe, in a letter to Jefferson, dated New York, June 16, 1785, speaks of "a Mr. Smith on the *Wealth of Nations*" as attempting to controvert the doctrine of the "balance of trade as one in pursuit of which Great Britain hath exposed herself to great injury." Smith's work was well known to Hamilton and Madison and was referred to by them and their political associates frequently during the last quarter of the eighteenth century. The book had direct reference to America, due to Franklin's influence, and was influential here long before it was influential in Europe. Washington's copy of the *Wealth of Nations* shows evidence that it had been carefully read; it contains proof corrections and notes in Washington's hand.

It is not too much to say that Franklin's influence on economic education is illustrative of his whole educational doctrine. He gave to Adam Smith apt illustrations of the utility of the ideas of the *Wealth of Nations*. So great have been the economic changes in the world due to the development of America, the illustrations in the *Wealth of Nations* which bear particularly upon the American colonies are now with difficulty estimated at their original value. It should be remembered that this book, which Buckle calls "the most important book ever written," and "the most valuable contribution ever made by a single man toward establishing the principles on which governments should be based," was the first work by a European scholar which made use of the American colonies to illustrate its doctrines, and pointed to those colonies as the country where the new political economy should develop in all its strength. Had Franklin done no more in the world than to contribute these illustrations to Adam Smith's book, he would have had a high place among the great teachers of mankind. Among books on economics of modern government the *Wealth of Nations* is to be classed with the *Federalist*, De Tocqueville's *Democracy in America*, and Bryce's *American Commonwealth*.

Franklin influenced English opinion by his association with the leading men of the times. The educational influence of such association may be suggested by mentioning some of his English friends. He was intimate with Burke, Hume, the Bishop of St. Asaph, Lord Kames, Sir John Pringle, Dr. Fothergill, Dr. Cannon, Dr. Richard Price, and Dr. Priestley; among his acquaintances were Lord Shelbourne, the Marquis of Rockingham, Lord De Lespencer, Lord Bathurst,

<sup>a</sup> See, specially, Franklin's idea of labor as a measure of wealth, expanded by Smith in Book I, and consult index to *The Wealth of Nations*, title "America," for illustrations of Franklin's influence on Smith.

Lord North, the astronomer Maskelyne, and Lord Morton. He was most intimate with Dr. Priestley, Dr. Shipley, the Bishop of St. Asaph, and David Hume.

In a conversation between Franklin and Priestley one evening, at the Royal Society, the question arose, "What is the most desirable invention that remains to be made?" Franklin answered, "The spinning of two threads at the same time." We are told that before he left London, Hargraves and Arkwright had perfected machinery by which 40 threads were spun by the same motion.<sup>a</sup>

Franklin's reply is illustrative of his utilitarianism; he lived in the days of leather breeches and vests and cumbersome greatcoats, when the poor were not clad in comfort. So expensive was woolen cloth, a family was obliged to make full use of it when once in possession. As is attested by the recorded wills of thousands of Americans of that time, the personal apparel of the parents was devised to the individual members of the family.

His services to his country by educating England to some comprehension of the conditions of the American colonies were temporarily suspended by his return to America in 1775, when it seemed to many that he had failed in securing the object of his mission. Subsequent events, however, proved that his contributions to the newspapers, in which he had discussed the American situation in a broad way, had educated the public mind, and his intimacy with men and women of learning and influence had laid the foundations of a political party.

His writings, which seem the spontaneous production of an easy mind, were the result of painstaking effort, of repeated interlineation, revision, and rewriting, and his best pieces were recast as many as seven or eight times before he published them. Among the Franklin papers in Washington are the successive copies of some of his most celebrated pieces. It is surprising, at first thought, that a man so busy as he could find time for such revision, and would have patience to give such detailed attention to the pieces which he wrote for the pleasure of his friends; but he loved details, and excelled in the exquisite practice of literary refinement. His anecdote or his scientific paper, freed from all useless words, at last attained the simple and concise style which he so frequently had pronounced the most perfect. His earliest defense of an education in English was doubtless suggested by his own patience and experience in writing his native tongue. He could not see any advantage in traveling along Italian Row, Spanish Row, and French Row, in the midst of the literary Vanity Fair, when the English way was so direct, convenient, and plain.

He never outgrew the lessons of his own efforts in self-culture. Perhaps history affords no better illustration of the effects of early education on the mind when men are called to decide on important matters than the curious judgment of the committee appointed by Congress July 4, 1776, consisting of Franklin, Jefferson, and John Adams, to prepare a device for a seal for the General Government.<sup>b</sup> The various devices proposed by the several members of the committee suggest the education which each had received in his boyhood. We learn from Adams that Dr. Franklin proposed as a device Moses lifting up his wand and dividing the Red Sea, and Pharaoh in his chariot overwhelmed with the waters, and the motto, "Rebellion to tyrants is obedience to God." Probably Franklin's memory of his home training in Milk street, where his childish ideas were colored by incidents in Jewish history, may explain the origin of his device.

<sup>a</sup> There are spinning mules in operation now in the city of Philadelphia which will spin 1,000 threads at a time. See Weedon's Social and Economic History of New England, remarks on "cloth," and "textile fabrics."

<sup>b</sup> The Seal of the United States; How it Was Developed and Adopted, Washington, Department of State, 1892.

Jefferson proposed the Children of Israel in the wilderness; led by a cloud by day, and a pillar of fire by night; and, on the other side, Hengist and Horsa, the Saxon chiefs, from whom we claim the honor of being descended, and whose political principles and form of government we have assumed. Evidently Jefferson's youthful training was not wholly biblical, and the curious mixture of Hebrewism and British mythology was characteristic of constructive and composite Jeffersonian politics.

John Adams forgot his Old Testament training and thought the choice should be of Hercules, "as engraved by Gribelin, in some editions of Lord Shaftesbury's works; the hero resting on his club; Virtue, pointing to her rugged mountain on one hand, and persuading him to ascend; Sloth, glancing at her flowery paths of pleasure, wantonly reclining on the ground, displaying the charms both of her eloquence and person, to seduce him into vice." Adams had read the seductive Shaftesbury at the turning point in his youthful education, and, characteristically abandoning the plain highway of Hebrew history, preferred the abstractions of the founder of the Carolinas.

It might be thought that, when suggesting a seal for the United States, Franklin would have proposed the figure of a saw, a hammer, or a printing press. After nearly six weeks' deliberation, Moses and Pharaoh and Hengist and Horsa and Lord Shaftesbury's Hercules were left behind, and the committee recommended a seal emblematic of the composite character of American institutions "A rose for England, a thistle for Scotland, a harp for Ireland, a fleur de lis for France, a black eagle for Germany, and a lion for the Low Countries." The name, the United States, was to appear by its initials upon the border, and the goddess of liberty, in armor, with spear, cap, and shield, was to support the emblazonment. Justice, with naked sword, was to keep guard. All was to be under the "eye of Providence" in a radiant triangle, whose glory extends over the shield and beyond the figures. The motto should be, "E Pluribus Unum," and round the whole should run the legend "Seal of the United States of America, MDCCLXXVI." Franklin seems, however, to have won the committee to his idea, and on the reverse of the seal Pharaoh was to sit in his chariot, with a crown on his head and a sword in his hand, passing through the divided waters of the Red Sea in pursuit of the fleeing Israelites. But even here Franklin illustrated his innate diplomacy by compromising with Jefferson in the device of a pillar of fire on a cloud, expressive of the Divine presence, which beamed on Moses, who stood on the shore extending his hand over the waters and causing the fearful overflow. Franklin's motto was retained. Happily for the device on our national seal, Dr. Franklin at this time was sent to France, and other committees, perhaps taking a hint from his famous story of the latter, suppressed all of the original design except the motto and the eye of Providence.

Experiments in the Gulf Stream. It was on his rough and painful voyage to France, in December, 1776, that Franklin, though suffering the miseries of unwholesome accommodations and almost continuous sea sickness, "contrived every day to take the temperature of the ocean, in order to verify anew his discovery of the warmth of the Gulf Stream." He could no more resist the opportunity of making experiments than he could resist being cheerful. An interesting collection of data might be made from his writings illustrative of his method of experimentation. It may be said that scarcely a page of his collected works fails to contain a suggestion of some experiment to determine the usefulness of the proposition under examination. His influence in American education is chiefly due to his starting his enginery of experiment. In the wake of his useful life there has followed a number of noble men who have contributed to the welfare of mankind by their experiments in connection with institutions founded by him or those founded under the impulse of his ideas.

Translation of the first State constitutions into French.

During his long residence in France he continued to educate Europe in American affairs, and not in these alone, but also in the principles of representative government. He put into the hands of Dr. Dubourg <sup>a</sup> a volume of the first constitutions of the American States and superintended their translation into French. It is of these constitutions that Thomas Paine said, "They were to liberty what grammar is to language; they define its parts of speech, and practically construct them into syntax." Their publication was opposed for a long time by the French Government, but public opinion at last forced them into print. The effect of thus bringing American ideas before the people of France is touched on by Franklin in a letter to Dr. Samuel Cooper, of Boston, in May, 1777:

All Europe is on our side of the question, as far as applause and good wishes can carry them. Those who live under arbitrary power do nevertheless approve of liberty, and wish for it; they almost despair of recovering it in Europe; they read the translations of our separate colony (?) constitutions with rapture, and there are such numbers everywhere who talk of removing to America with their families and fortunes as soon as peace and our independence shall be established; that it is generally believed we shall have a prodigious addition of strength, wealth, and arts from the emigrations of Europe, and it is thought that to lessen or prevent such emigrations the tyrannies established there must relax and allow more liberty to their people. Hence it is a common observation here that our cause is the cause of all mankind, and that we are fighting for their liberty in defending our own.

This passage well illustrates Franklin's political economy. Turgot and Neckar. He would appeal to the public; he would encourage emigration to America at a time when emigration was almost unknown, when the difficulties in the way of the German or French or Dutch family who would find a home in America practically prohibited emigration. Franklin proceeded on universal principles and made the American cause "the cause of all mankind." He touched the French mind at a point where the slightest friction kindled a flame, and the effect of the publication of our first constitutions in hastening and shaping the French Revolution is beyond computation. It is known that Turgot and Neckar opposed giving French aid to the American colonies on the ground of the tremendous cost in which it would involve France, not merely depleting the treasury, but undermining the monarchy.

It is Franklin's work in France which gave expression there to the philosophy of David Hume and the economy of Adam Smith. These three men—Franklin, Hume, and Smith—were the intellectual triumvirate of the eighteenth century. The philosophy of Hume, the economy of Adam Smith, and the practicality of Franklin represent the three controlling ideas of that creative period; to the influence of these three men, who cooperated at a critical time in the development of constitutional government, the world owes the development of modern science, of modern industry, and of representative government. The meeting of three such forces in the world signified that in future ages mankind should enjoy freedom of thought, freedom in commerce, and freedom in government.

In his *Proposals Relating to the Education of Youth in Pennsylvania* he declared that "the idea of what is true merit should also be often presented to youth, explained and impressed on their minds, as consisting in the inclination joined with the ability to serve mankind, one's country, friends, and family; which ability is, with the blessing of God, to be acquired or greatly increased by true learning, and should indeed be the great aim and end of all learning"—a precept he practiced. The translations of the American constitutions served "the cause of all mankind."

<sup>a</sup> It was M. Dubourg who had been chiefly instrumental in publishing many of Franklin's letters on electricity.

Franklin was constantly mindful of his friends and his family whenever he could serve them, either in private or public life; any of his relatives who was capable of filling office usually filled one. His life is full of applications of his

He applies his theory of prizes. system of prizes and rewards laid down in his scheme for an ideal English school. If he would give gilt books to children, he would give to those who served their country the reward of

public recognition. Here is an instance in point. Thomas Wren was a dissenting clergyman at Portsmouth, England, who sympathized with the American cause, pitied the distress of the American prisoners, and devoted much of his time to the relief of those in Forton jail. He gave freely of his own small fortune; obtained the assistance of his friends; he bought clothing, medicine, and food, and, in every way in his power, contributed to the comfort of those unhappy men. Dr. Franklin was in correspondence with him throughout the war, and as a slight proof of his sense of the indebtedness of the public to him, was instrumental in securing him a vote of thanks from Congress in 1783 and the degree of Doctor of Divinity from Princeton College.

Illustrations abound in his life of his constant practice of the principles laid down in his scheme for the training of youth. Utilitarianism has its machinery of compensation and he ever worked this with success. His scheme of education made no provision for the useless man, and on several occasions he makes an ancient college, as in case of Princeton, the means of rewarding a useful act. He seems to have discovered an appropriateness in the granting of college degrees, which, at that time as now, were often abused.

Franklin and Adams in France. It was in 1778, while in his seventy-second year, when he and John Adams were associated in diplomatic work in Paris, that the difference in their training became apparent. Adams was a lawyer, regular in all his habits, clear in interpreting his own course in public affairs, and one of that great company of human beings who worship system and order. The first cause of difference between the two men related to order. Of order Franklin had little and Adams much. Everybody recalls the exquisite confession in Franklin's Autobiography of his failure to acquire orderly habits. It occurs in his account of his effort to apply his Art of Virtue. One of the virtues, according to this art, was order.

The story of the speckled ax. I made so little progress in amendment [he confesses] and had such frequent relapses that I was almost ready to give up the attempt and content myself with a faulty character in that respect, like the man who, in buying an ax of a smith, my neighbor, desired to have the whole of its surface as bright as the edge. The smith consented to grind it bright for him if he would turn the wheel; he turned, while the smith pressed the broad face of the ax hard and heavily on the stone, which made the turning of it very fatiguing. The man came every now and then from the wheel to see how the work went on, and at length would take his ax as it was, without further grinding. "No," said the smith, "turn on, turn on; we shall have it bright by and by; as yet it is only speckled." "Yes," says the man, "but I think I like a speckled ax best." And I believe this may have been the case with many who, having for want of some such means as I employed found the difficulty of obtaining good and breaking bad habits in other points of vice and virtue, have given up the struggle and concluded that "a speckled ax was best;" for something that pretended to be reason was every now and then suggesting to me that such extreme nicety as I exacted of myself might be a kind of foppery in morals, which, if it were known, would make me ridiculous; that a perfect character might be attended with the inconvenience of being envied and hated; and that a benevolent man should allow a few faults in himself, to keep his friends in countenance. In truth, I found myself incorrigible with respect to order; and now I am grown old, and my memory bad, I feel very sensibly the want of it.

If Franklin's appetite for order had been keener he might possibly have collected his various writings, or completed his autobiography, or arranged more perfectly the details of many of his experiments, or set forth somewhere the

means by which he arrived at so many of his opinions. Though he is always taking us into his confidence, there are many interesting matters about him on which we would like further information. Like Daniel Webster, he was capable of taking his ease. His large soul had need to be stirred now and then by lesser men. He would have never undertaken his autobiography—that priceless fragment of literature—had it not been pressed upon him repeatedly by his friends.

That he was estimated a hundred years ago very much as he is to-day is evident from a letter to him by Benjamin Vaughan, bearing date Paris, January 31, 1783, in which he is urged to continue his autobiography and to write his *Art of Virtue*.

Your history is so remarkable that if you do not give it somebody else will certainly give it, and perhaps so as nearly to do as much harm as your own management of the thing might do good.

It will moreover present a table of internal circumstances of your country which will very much tend to invite to it settlers of virtuous and manly minds; and, considering the eagerness with which such information is sought by them and the extent of your reputation, I do not know of a more efficacious advertisement than your biography would give.

All that has happened to you is also connected with the detail of the manners and situation of a rising people, and in this respect I do not think that the writings of Caesar and Tacitus can be more interesting to a true judge of human nature and society.

But these, sir, are small reasons, in my opinion, compared with the chance which your life will give for the forming of future great men; and in conjunction with your *Art of Virtue* (which you design to publish) of improving the features of private character, and consequently of aiding all happiness, both public and domestic.

The two works I allude to, sir, will in particular give a noble rule and example of self-education. School and other education constantly proceed upon false principles, and shows a clumsy apparatus pointed at a false mark; but your apparatus is simple, and the mark a true one; and while parents and young persons are left destitute of other just means of estimating and becoming prepared for a reasonable course in life, your discovery that the thing is in many a man's private power will be invaluable.

Influence upon the private character, late in life, is not only an influence late in life, but a weak influence. It is in youth that we plant our chief habits and prejudices; it is in youth that we take our party as to profession, pursuits, and matrimony. In youth, therefore, the turn is given; in youth the education even of the next generation is given; in youth the private and public character is determined; and the term of life extending but from youth to age, life ought to begin well from youth; and more especially before we take our party as to our principal objects.

But your biography will not merely teach self-education, but the education of a wise man; and the wisest man will receive lights and improve his progress by seeing detailed the conduct of another wise man. And why are weaker men to be deprived of such helps, when we see our race has been blundering on in the dark, almost without a guide in this particular, from the farthest trace of time? Show then, sir, how much is to be done, both to sons and fathers; and invite all wise men to become like yourself, and other men to become wise.

When we see how cruel statesmen and warriors can be to the human race, and how absurd distinguished men can be to their acquaintance, it will be instructive to observe the instances multiply of pacific, acquiescing manners; and to find how compatible it is to be great and domestic, enviable and yet good humored.

The little private incidents which you will also have to relate will have considerable use, as we want, above all things, rules of prudence in ordinary affairs; and it will be curious to see how you have acted in these. It will be so far a sort of key to life, and explain many things that all men ought to have once explained to them, to give them a chance of becoming wise by foresight.

The nearest thing to having experience of one's own is to have other people's affairs brought before us in a shape that is interesting; this is sure to happen from your pen: your affairs and management will have an air of simplicity or importance that will not fail to strike, and I am convinced you have conducted them with as much originality as if you had been conducting discussions in politics or philosophy, and what more worthy of experiments and system (its importance and its errors considered) than human life?

Some men have been virtuous blindly, others have speculated fantastically, and others have been shrewd to bad purposes; but you, sir, I am sure, will give under your hand nothing but what is at the same moment wise, practical, and good.

Your account of yourself (for I suppose the parallel I am drawing for Dr. Franklin will hold not only in point of character, but of private history) will show that you are ashamed of no origin; a thing the more important, as you prove how little necessary all origin is to happiness, virtue, or greatness.

As no end likewise happens without a means, so we shall find, sir, that even you yourself framed a plan by which you became considerable; but at the same time we may see that though the event is flattering, the means are as simple as wisdom could make them; that is, depending upon nature, virtue, thought, and habit.

Another thing demonstrated will be the propriety of every man's waiting for his time for appearing upon the stage of the world. Our sensations being very much fixed to the moment, we are apt to forget that more moments are to follow the first, and consequently that man should arrange his conduct so as to suit the whole of a life. Your attribution appears to have been applied to your life, and the passing moments of it have been enlivened with content and enjoyment, instead of being tormented with foolish impatience or regrets. Such a conduct is easy for those who make virtue and themselves their standard, and who try to keep themselves in countenance by examples of other truly great men, of whom patience is so often the characteristic.

Your Quaker correspondent \* \* \* praised your frugality, diligence, and temperance, which he considered as a pattern for all youth; but it is singular that he should have forgotten your modesty and your disinterestedness, without which you never could have waited for your advancement or found your situation in the meantime comfortable; which is a strong lesson to show the poverty of glory and the importance of regulating our minds. If this correspondent had known the nature of your reputation as well as I do he would have said, Your former writings and measures would secure attention to your Biography and Art of Virtue; and your Biography and Art of Virtue, in return, would secure attention to them. This is an advantage attendant upon a various character and which brings all that belongs to it into greater play; and it is the more useful, as perhaps more persons are at a loss for the means of improving their minds and characters than they are for the time or the inclination to do it. \* \* \* If it encourages more writings of the same kind with your own, and induces more men to spend lives fit to be written, it will be worth all Plutarch's Lives put together. \* \* \* Considering your great age, the caution of your character, and your peculiar style of thinking, it is not likely that any one besides yourself can be sufficiently master of the facts of your life or the intentions of your mind.

Besides all this, the immense revolution of the present period will necessarily turn our attention toward the author of it; and when virtuous principles have been pretended in it, it will be highly important to show that such have really influenced; and as your own character will be the principal one to receive a scrutiny, it is proper (even for its effects upon your vast and rising country, as well as upon England and upon Europe) that it should stand respectable and eternal.

For the furtherance of human happiness, I have always maintained that it is necessary to prove that man is not even at present a vicious and detestable animal; and still more, to prove that good management may greatly amend him; and it is for much the same reason that I am anxious to see the opinion established that there are fair characters existing among the individuals of the race, for the moment that all men, without exception, shall be conceived abandoned, good people will cease efforts deemed to be hopeless, and perhaps think of taking their share in the scramble of life, or at least of making it comfortable principally for themselves. \* \* \*

Extend your views even further; do not stop at those who speak the English tongue, but after having settled so many points in nature and politics think of bettering the whole race of men.

This appeal was turning the tables on Franklin and was happily effectual in causing him to resume his Autobiography at

Passy, near Paris, in the following year. The letter is prophetic of the place that Franklin was to hold in American life. Who can estimate the number of readers of the Autobiography, and who can tell how many lives have been made useful by it? Fifty years ago the means for securing an education in America were imperfect. Franklin's Autobiography was the great textbook of active minds among the young, and in America to-day there are few emi-

The Autobiography resumed.

nent self-made men 60 years of age and native born who will not place Franklin's Autobiography among the few books that suggested a possible career in life by self-education. The book did for their generation even more than Sartor Resartus or Emerson's Essays did for the generation of forty years ago. The Autobiography long ago became a book-making book because Franklin's life was a book-making life.

The old Congress of the Confederation seems to have realized the value of education in a democracy, for in 1780 it requested Franklin to make a schoolbook out of the record of British atrocities in the American war. He once described this commission to his English friend Hartley. The book was to have "thirty-five prints, designed here by good artists, and engraved, each expressing one or more of the different horrid facts to be inserted in the book, in order to impress the minds of children and posterity with a deep sense of your bloody and insatiable malice and wickedness." But Franklin was not a Eugene Sue; he resolved not to undertake the work, hoping that a reconciliation might be effected, but added, "every fresh instance of your devilism weakens that resolution and makes me abominate the thought of a reunion with such a people." Benjamin Vaughan was wiser than Congress when he intimated that the Autobiography would make a great American schoolbook. The influence of Franklin on American life has been greater through the Autobiography than through the institutions which he founded or which were founded by his followers. Many schools in America now use the Autobiography as a textbook.

Franklin was a prince of democrats. The great feature of his entire public policy is well said by Parton to be "to enlighten public opinion, and to bring enlightened public opinion to bear upon the councils of public men." In this lofty effort he was surpassed by none of his contemporaries and has been equaled by few of his successors.

In 1784 a town in Norfolk County, Massachusetts, in its sixth year, took upon itself his name, and sending notice of the honor Franklin informed him that they would build a suitable tower to their church if he would present them with a bell. His famous reply asking them to accept a gift of books instead of a bell, "sense being preferable to sound," led to the founding of a public library in the town. Its first books were selected by Dr. Price, who, at Franklin's request, limited the choice to such as were most proper to inculcate principles of sound religion and just government. He was too busy probably to make out the full list himself. At his sister's request he recommended Stennet's Discourse on Personal Religion. The books selected by Dr. Price were duly presented to the town. They reflect the ruling ideas of the period, but most of them were long since put upon the high shelves in the library.<sup>a</sup>

<sup>a</sup>They were as follows: Clarke's works, Hoadley's works, Barrow's works, Ridgeley's works, Locke's works, Sidney's works, Montesquieu's Spirit of Laws, Blackstone's Commentaries, Watson's Tracts, Newton on the Prophecies, Law on Religion, Priestley's Institutes, Priestley's Corruptions, Price and Priestley, Lyndsey's Apology, Lyndsey's Sequel, Abernethy's Sermons, Duchal's Sermons, Price's Morals, Price on Providence, Price on Liberty, Price's Sermons, Price on the Christian Scheme, Needham's Free State, West and Lyttleton on the Resurrection, Stennet's Sermons, Addison's Evidences, Gordon's Tacitus, Backus's History, Lardner on the Logos, Watts's Orthodoxy and Charity, Brainerd's Life, Bellamy's True Religion, Doddridge's Life, Bellamy's Permission of Sin, Fordyce's Sermons, Heramenway against Hopkins, Hopkins on Holiness, Life of Cromwell, Fulfilling of the Scriptures, Watts on the Passions, Watts's Logic, Edwards on Religion, Dickinson on the Five Points, Christian History, Prideaux's Connections, Cooper on Predestination, Cambridge Platform, Stoddard's Safety of Appearing, Burkett on Personal Reformation, Barnard's Sermons, Shepard's Sound Believer, History of the Rebellion, Janeway's Life, Hopkins's System, American Preacher, Emmons's Sermons, Thomas's Laws of Massachusetts, American Constitutions, Young's Night Thoughts, Pilgrim's Progress, Ames's Orations, Spectator, Life of Baron Trenck, Cheap Repository, Moral Repository, Fitch's Poems, Erskine's Sermons.

It was about this time that Franklin's name appeared on the map of the United States, in the State of Franklin (Tennessee), in counties, and in towns.

The last official act done by him in Europe was the affixing of his signature to the treaty with Prussia,<sup>a</sup> which contained what was considered at that time a novel proposition, but one to which he was devoted, and which he was instrumental in introducing, laying it down that free ships make free goods, and that private property shall be secure from seizure and destruction in time of war. Washington spoke of this treaty as marking a new era in negotiation, but its liberal principles have not yet won full recognition in diplomacy and international law.

The return voyage from France, in 1785, lasted seven weeks and gave him another opportunity for experiment, and he availed himself of his leisure to write an elaborate paper, in the form of a letter, to David Le Roy, on the construction, sailing, loading, provisioning, and saving of ships, and the winds, currents, and temperature of the sea, with 27 illustrations and sea charts and 6 tables of thermometrical observations. It was the eighth time that he had crossed the Atlantic and was productive of one of his most useful suggestions—the construction of water-tight compartments in ships, now long in common use. He took the idea from the Chinese, with whose habits his wide reading had acquainted him.<sup>b</sup>

One his return to Philadelphia, after his long absence in France, he received congratulatory addresses from the assembly of Pennsylvania and from the provost, vice-provost, and professors of the University of Pennsylvania, which he had been instrumental in founding.

The address, September 16, 1785, of the provost and his associates was as follows:

HONORED SIR: The provost, vice-provost, and professors of the University of Pennsylvania beg leave to congratulate you on your safe arrival in your native country after having accomplished the duties of your exalted character with dignity and success.

While we participate in the general happiness of America, to the establishment of which your political abilities and patriotic exertions have so signally contributed, we feel a particular pleasure in paying our acknowledgments to the gentleman who first projected the liberal plan of the institution over which we have the honor to preside.

Not contented with enriching the world with the most important discoveries in natural philosophy, your benevolence and liberality of sentiment early engaged you to make provision for exciting a spirit of inquiry into the secret operations of nature, for exalting and refining the genius of America by the propagation of useful learning, and for qualifying many of her sons to make that illustrious figure which has commanded the esteem and admiration of the most polished nations of Europe.

Among the many benevolent projections which have laid so ample a foundation for the esteem and gratitude of your native country, permit this seminary to reckon her first establishment, upon the solid principles of equal liberty, as one of the most considerable and important. And now, when restored, through the influence of our happy constitution, to her original broad and catholic bottom; when enriched by the protection of generous donations of a public-spirited and patriotic assembly; and when flourishing under the countenance of the best friends of religion, learning, and liberty in the State, she can not but promise herself the continued patronage of the evening of that life which divine Providence has so eminently distinguished.

May the same indulgent Providence yet continue your protracted life, enriched and crowned with the best of blessings, to nurse and cherish this favorite child of your youth; that the future sons of science in this Western World may have additional reason to remember the name of Franklin with gratitude and pleasure.

Signed, in the name and by order of the faculty, by

JOHN EWING, *Provost.*

<sup>a</sup> September 10, 1785, *Treaties and Conventions*, 399-907.

<sup>b</sup> The paper was afterwards read at a meeting of the American Philosophical Society, December 2, 1785, and is found in Volume IX of Bigelow's edition of Franklin's Works.

The modesty of Franklin's reply is equaled only by Washington's when he accepted the office of Commander in Chief of the American Army:

I am greatly obliged, gentlemen, by your kind congratulations on my safe arrival.

It gives me extreme pleasure to find that seminaries of learning are increasing in America, and particularly that the university over which you preside continues to flourish. My best wishes will always attend it.

The instruction of youth is one of those employments which to the public are most useful; it ought, therefore, to be esteemed among the most honorable. Its successful exercise does not, however, always meet with the reward it merits, except in the satisfaction of having contributed to the forming of virtuous and able men for the service of their country.

The address is sufficient evidence of the recognition at the time of his services to education, and of the friendly relations which existed between him and the university of which he was a trustee. The minutes of the meetings of the board show that he had always attended them when he was present in the country. The proof of his presence is his signature, as it was customary for each member of the board present at a meeting to attest the fact by signing the record.

On his return to Philadelphia he was almost unanimously elected president of the Commonwealth,<sup>a</sup> and was inducted into office with much ceremony, the chief officers of the State and city government, the provost and faculty of the University of Pennsylvania, the militia and the citizens joining in the inauguration. Like Washington, Franklin accepted the cares of the presidency, but refused any salary, acting in conformity with his well-known principles that in a representative democracy the most responsible offices should be filled without compensation. He was three times chosen to the office, and he gave the salary toward the founding of colleges and other useful institutions in the State.

His countrymen had come to recognize him as the patron of every enterprise of a literary or philanthropic character, and it was during his presidency in 1786 that a plan for a college in the borough of Lancaster, Pa., was presented to the general assembly and approved. Out of respect to the character of "his excellency the president of the State," the institution was called Franklin College.

On the 6th of June, 1787, the college was formally opened. It had been founded to meet the wants of the German population in Pennsylvania, and was under the control of the Lutheran Church.<sup>b</sup> Of the opening exercises <sup>c</sup> an interesting account remains.

Whether Franklin was personally present at this festival is doubtful. That he was in Lancaster at some time in the year 1787, on an occasion which has been denominated "the laying of the corner stone," appears highly probable. A French writer, Hector St. John Crèvecoeur, has preserved a record of such an event in a book of travels: "In the year 1787 I accompanied the venerable Franklin, at that time governor of Pennsylvania, on a journey to Lancaster, where he had been invited to lay the corner stone of a college which he had founded there for the Germans. In the evening of the day of the ceremony we were talking of the different nations which inhabit the continent." Crèvecoeur then gives the substance

<sup>a</sup> Strictly speaking, president of the executive council.

<sup>b</sup> In the exercises attending the opening of the college, Franklin, it is said, was especially pleased to see Episcopalians, Presbyterians, Lutherans, Catholics, Moravians, and Quakers all join harmoniously in the celebration.

<sup>c</sup> Of these exercises the Abbé Morellet wrote to Franklin from Auteuil, July 31, 1787: "In the dedication of your college in the county of Lancaster, and the fine procession and the religious ceremony where were met together Presbyterians, Episcopalians, Lutherans, Catholics, Moravians, *e tutti quanti*, there was toleration in practice."

See reprint, *The Founding of Franklin College, 1787*, by Rev. J. H. Dubbs, D. D., from the *Reformed Quarterly Review*, Philadelphia Reformed Church Publication Board, 907 Arch street.

of a conversation between Franklin and one of the principal residents of the town concerning the origin of the American Indians.

The above statement appears clear and explicit, but in order to make assurance doubly sure the Rev. Dr. F. A. Muhlenberg examined the original authorities. In a private letter of July 27, 1887, he says:

I found a copy of Duyckinck's Cyclopaedia in the Mercantile Library, and on page 175, as you mentioned, the exact words of your quotation. There was, however, no copy of the original work. I was not altogether satisfied. I went next to the Philadelphia Library, and found an edition of Hector St. John Crèvecoeur in French, into which it had been translated by the author. In the second chapter I found the same in substance with that given by Duyckinck, and the conversation with one of the citizens of the "ville" on the subject of the Indians of this country. The conversation is said to have taken place after the ceremonies. The words used by Mr. Crèvecoeur for the corner stone are "*la première pierre.*" Such an explicit statement, with such details, could not be questioned. No man would, in the possession of reason, attempt to deceive the world in such a fashion. Besides, in the other parts of his work, consisting of three volumes in this edition, he gives descriptions of our country, with engravings, which prove that he was an eyewitness of what he describes, and his truthful character. Still further, all the books on bibliography represent him as a reliable author. Dr. Franklin was, therefore, in Lancaster, at what Mr. Crèvecoeur calls the laying of the "*première pierre,*" in the year 1787.

It is not probable that the occasion to which reference is here made was literally the laying of the corner stone, as the college had no building of its own until a later period. There might have been a minor festival of some sort prior to the formal opening in June; but if this was the case it is strange that there is no reference to the fact in the correspondence of the times. It is, after all, most likely that Crèvecoeur refers to the formal opening, or so-called "dedication," and that this was the occasion on which Franklin was present; the fact is nowhere explicitly stated, but there are many circumstances which render it probable. Franklin's name was frequently mentioned throughout the services in a way which seems to indicate his presence. In each of the three original hymns he is spoken of with the highest reverence, and in one of them the college is termed "his child." The prayer delivered on the occasion by the Rev. Mr. Herbst closes with an intercession for "the noble protector of the college, His Excellency Benjamin Franklin." Dr. Muhlenberg says, "I think it can be fairly inferred from the connection in which it stands and the peculiar prominence given to it that his excellency must have been present."

It has been asserted that it was impossible for Franklin to be in Lancaster, on account of his engagements in the Constitutional Convention in Philadelphia. On this subject Dr. Muhlenberg says in the letter from which I have quoted—

Evidence of his attendance. I have examined Madison's, Elliott's, and Yates's reports, and one other, the author of which I do not now remember. I find that Dr. Franklin is reported by one and all of these authorities as present at the Constitutional Convention, on Saturday and Monday, the 2d and 4th of June, taking part also in the proceedings, but there is no mention of his name or allusion to him on Wednesday, Thursday, and Friday, the 6th, 7th, and 8th of June, but on Saturday, 9th, his name again appears. Here is a margin to render it probable that he was absent for cause.

This is an error. His name next appears on the 11th (Madison and Yates), when he presented, through Wilson, his plan of representation. There is no reference to a Lancaster visit in Franklin's works. He was quite feeble in body at this time and was unable to stand and address the convention.

In the year 1787 he became a member of the convention which framed the Constitution of the United States. He was somewhat of a physiocrat at this time, favoring a liberal government, but not one tending to monarchy, nor so big as to fall into anarchy. He

Franklin in the convention of 1787.

was the diplomat in the convention, and typified the controlling idea of compromise, which at last gave us our Constitution.<sup>a</sup>

During the closing years of his life we have glimpses of the persistency of the ideas which he had formulated many years before. The well-known account of Dr. Manasseh Cutler's visit to him in July, 1787, shows the interest which Franklin still took in natural history, "of which," says Cutler, "he seemed extremely fond, while the other gentlemen were swallowed up with politics."

When, on the 17th of September, the convention adjourned, Franklin exerted himself to promote the adoption of the Constitution. Its ratification by ten States gave occasion for a splendid celebration in Philadelphia in honor of the event, when all the interests of the city contributed to an industrial and civic parade. James Wilson, one of the delegates from Pennsylvania, eminent as a lawyer, a man whose services in the convention Washington considered as unsurpassed, and whom Bryce in his *American Commonwealth* has called "the greatest lawyer in the convention," who became a professor of law in the University of Pennsylvania and justice of the Supreme Court of the United States, pronounced the oration. In the industrial parade there was a car upon which a printing press was operated and from which were scattered among the people copies of a song in honor of the trades, written by Franklin. It is suggestive of his utilitarian notions.

"Ye tailors! of ancient and noble renown,  
Who clothe all the people in country and town,  
Remember that Adam, your father and head,  
Though lord of the world, was a tailor by trade.

"Ye shoemakers! noble from ages long past,  
Have defended your rights with your *awl* to the *last*;  
And cobblers so merry, not only stop holes,  
But work night and day for the good of our *soles*.

"Ye hatters! who oft with hands not very fair,  
Fix hats on a block for a blockhead to wear,  
Though charity covers a sin now and then,  
You cover the heads and the sins of all men.

"And carders, and spinners, and weavers attend,  
And take the advice of Poor Richard, your friend;  
Stick close to your looms, your wheels, and your card,  
And you never need fear of the times being hard.

"Ye coopers! who rattle with drivers and adz,  
A lecture each day upon hoops and on heads,  
The famous old ballad of Love in a tub,  
You may sing to the tune of your rub-a-dub-dub.

"Each tradesman turn out with his tools in his hand,  
To cherish the arts and keep peace in the land;  
Each 'prentice and journeyman join in my song,  
And let the brisk chorus go bounding along."

The lines suggest how Franklin viewed the world as an opportunity for an industrious and intelligent apprentice.<sup>b</sup>

<sup>a</sup>For a detailed account of his services in the formation of the Constitution, see my *Constitutional History of the United States, 1763-1895*, index Franklin.

<sup>b</sup>There is an interesting and curious illustration of changes in times and manners in a passage by Parton concerning the things which Franklin would particularly notice had he returned to this world in 1870:

He sometimes amused his friends with humorous predictions of inventions yet to be, and expressed a wish to revisit the earth at the end of the century to see how man was getting on. Would that he could! How pleasant to show the shade of Franklin about the modern world! What would he say of the Great Eastern, the Erie Canal, the locomotive, the telegraph, the Hoe printing press, the steam typesetter, chloroform, the sewing machine, the Continental Hotel, the Fairmount waterworks, the improved strawberry, the omnibus, gaslight, the Sanitary Commission, Dr. Buckle's History, Mills's Political Economy, Herbert Spencer's First Principles, Adam Bede, David Copperfield, the Philadelphia High School, Henry Ward Beecher's church, the Heart of the Andes? Surely he would admit that we have done pretty well in the seventy-five years that have passed since he left.

Old age had crept upon him, but his mental powers were undiminished and his opinion of himself he expressed when he said, "I seem to have intruded myself into the company of posterity."

In 1789 he was rarely free from pain and was confined to his bed much of the time. We learn of him through his letters, which, though less frequent, were equal to any that had made his correspondence so valuable and interesting. Though suffering great agony, he sought mental relief in reading Johnson's *Lives of the Poets*, and a life of Watts, his favorite author. His opinion of Watts confirms the judgment of thousands who have found that hymnologist their comfort. It was at this time also that he wrote his protest against the study of Latin and Greek in preference to the study of English,<sup>a</sup> a masterly piece which anticipated a reform in modern education.

In August, 1788, the Library Company,<sup>b</sup> the outgrowth of the Junto of half a century before, had laid the corner stone of its new building in Philadelphia, on Fifth street, opposite the statehouse.

Franklin, unable on account of his infirmities to attend the ceremony, wrote the inscription for the corner stone, omitting any mention of himself. The committee amended the inscription, which reads:

Be it remembered  
In honor of the Philadelphia Youth,  
(then chiefly artificers)  
that in MDCCCXXI,  
they cheerfully,  
at the instance of Benjamin Franklin,  
one of their number,  
instituted the Philadelphia Library,  
which, though small at first,  
is become highly valuable and extensively useful  
and which the walls of this edifice  
are now destined to contain and preserve,  
the first stone of whose foundation  
was here placed,  
the thirty-first day of August, 1789.<sup>c</sup>

Perhaps no institution founded by him illustrates his sagacity and usefulness better than this library. I referred briefly to its origin in the Junto. In 1880 a new library building was erected at the corner of Juniper and Locust streets, and in 1878 the magnificent structure known as the Ridgway Branch.

His last public act was in keeping with his whole philosophy of life, a reply written on the 23d of March, 1790, but twenty-six days before his death, to a speech of Mr. Jackson, of Georgia, in the Congress of the United States, on slavery. It was addressed to the editor of the *Federal Gazette* and is in Franklin's happiest style. The essay pretends to be a speech delivered in the Divan of Algiers in 1687 against the petition of the sect called Erika, or Purists, who prayed for the abolition of piracy and slavery as being unjust. All the arguments advanced in favor of negro slavery were applied in this speech with equal force in the justification of the plundering and enslaving of Europeans.<sup>d</sup>

<sup>a</sup> See *Observations Relating to the Intentions of the Original Founders of the Academy in Philadelphia*, June, 1789.

<sup>b</sup> By an order of the Library Company, August 31, 1774, the delegates to the first Continental Congress were allowed the use of such of the books of the library as they might have occasion for during their sitting. (*Elliott's Debates*, Vol. I, 43.)

<sup>c</sup> The original stone was discovered a few years ago and is now set in the north wall of the new library building, Locust and Juniper streets.

<sup>d</sup> Dr. Stuber, a distinguished Philadelphian of that day [says Parton], mentions that many persons searched the book stores and libraries of the town for Martin's Account of his Consulship, anno 1687, from which the speech of Sidi Mehemet Ibrahim was said to have been taken (See the article in full, Bigelow, Vol. X.)

This grand protest against slavery was a happy bequest to mankind. Franklin believed "that equal liberty was originally the portion and is still the birthright of all men, and influenced by the strong ties of humanity and the principles of their institution \* \* \* to use all justifiable endeavors to loosen the bands of slavery and promote a general enjoyment of the blessings of freedom."

He faced death with calmness. If he had neglected to practice order in his life, he made formal preparation for his death.

A trick for doing good. His will—an elaborate document—perpetuated, in its provisions for public charities, his own utilitarian ideas. He remembered his scheme of prizes in his ideal school, and gave £100 to the managers of the Boston free schools, the interest of which should be devoted to the purchase of silver medals for the encouragement of scholarship. He sought to make his benevolence immortal. Though it has been said that his scheme is derived from a French work by Mathon de la Cour, the idea was probably quite his own, as he had suggested it when making a loan to Benjamin Webb many years before.

I send you herewith a bill for ten louis d'ors. I do not pretend to give such a sum; I only lend it to you. When you shall return to your country with a good character, you can not fail of getting into some business that will in time enable you to pay all your debts. In that case, when you meet with another honest man in similar distress you must pay me by lending this sum to him, enjoining him to discharge the debt by a like operation when he shall be able and shall meet with such another opportunity. I hope it may thus go through many hands before it meets a knave that will stop its progress. This is a trick of mine for doing a deal of good with a little money. I am not rich enough to afford much in good works, and so am obliged to be cunning and make the most of a little.

His plan for the benefit of artisans.

His plan was for the benefit of artisans and apprentices and illustrates the ruling ideas of his life.

I have considered that among artisans good apprentices are most likely to make good citizens, and, having myself been bred to a manual art, printing, in my native town, and afterwards assisted to set up my business in Philadelphia by kind loans of money from two friends there, which was the foundation of my fortune and of all the utility in life that may be ascribed to me, I wish to be useful even after my death, if possible, in forming and advancing other young men that may be serviceable to their country in both those towns. To this end I devote two thousand pounds sterling, of which I give one thousand thereof to the inhabitants of the town of Boston, in Massachusetts, and the other thousand to the inhabitants of the city of Philadelphia, in trust, to and for the uses, intents, and purposes hereinafter mentioned and declared.

The said sum of one thousand pounds sterling, if accepted by the inhabitants of the town of Boston, shall be managed under the direction of the selectmen, united with the ministers of the oldest Episcopalian, Congregational, and Presbyterian churches in that town, who are to let out the sum upon interest, at five per cent per annum, to such young married artificers, under the age of twenty-five years, as have served an apprenticeship in the said town, and faithfully fulfilled the duties required in their indentures, so as to obtain a good moral character from at least two respectable citizens, who are willing to become their sureties, in a bond with the applicants, for the repayment of the moneys so lent, with interest, according to the terms hereinafter prescribed; all which bonds are to be taken for Spanish milled dollars, or the value thereof in current gold coin; and the managers shall keep a bound book or books, wherein shall be entered the names of those who shall apply for and receive the benefits of this institution, and of their sureties, together with the sums lent, the dates, and other necessary and proper records respecting the business and concerns of this institution. And as these loans are intended to assist young married artificers in setting up their business, they are to be proportioned, by the discretion of the managers, so as not to exceed sixty pounds sterling to one person, nor to be less than fifteen pounds; and if the number of applicants so entitled should be so large as that the sum will not suffice to afford to each as much as might otherwise not be improper, the proportion to each shall be diminished so as to afford to everyone some assistance. These aids may therefore be small at first, but as the capital increases by the accumulated interest they will be more ample. And in order to serve as many as possible in their turn, as well as to make the repayment of the principal borrowed more easy,

each borrower shall be obliged to pay, with the yearly interest, one-tenth part of the principal, which sums of principal and interest so paid in shall be again let out to fresh borrowers.

And as it is presumed that there will always be found in Bequest to Boston. Boston virtuous and benevolent citizens, willing to bestow a part of their time in doing good to the rising generation by superintending and managing this institution gratis, it is hoped that no part of the money will at any time be dead or be diverted to other purposes, but be continually augmenting by the interest; in which case there may, in time, be more than the occasions in Boston shall require, and then some may be spared to the neighboring or other towns in the said State of Massachusetts, who may desire to have it, such towns engaging to pay punctually the interest and the portions of the principal annually to the inhabitants of the town of Boston.

If this plan is executed, and succeeds as projected without interruption for one hundred years, the sum will then be one hundred and thirty-one thousand pounds, of which I would have the managers of the donation to the town of Boston then lay out, at their discretion, one hundred thousand pounds in public works, which may be judged of most general utility to the inhabitants, such as fortifications, bridges, aqueducts, public buildings, baths, pavements, or whatever may make living in the town more convenient to its people and render it more agreeable to strangers resorting thither for health or a temporary residence. The remaining thirty-one thousand pounds I would have continued to be let out on interest, in the manner above directed, for another hundred years, as I hope it will have been found that the institution has had a good effect on the conduct of youth and been of service to many worthy characters and useful citizens. At the end of this second term, if no unfortunate accident has prevented the operation, the sum will be four millions and sixty-one thousand pounds sterling, of which I leave one million sixty-one thousand pounds to the disposition of the inhabitants of the town of Boston and three millions to the disposition of the government of the State, not presuming to carry my views farther.

All the directions herein given respecting the disposition and management of the donation to the inhabitants of Boston I would have observed respecting that to the inhabitants of Philadelphia, only, as Philadelphia is incorporated, I request the corporation of that city to undertake the management, agreeably to the said directions; and I do hereby vest them with full and ample powers for that purpose. \* \* \*

Such was the plan adopted by Franklin for the benefit of a class he always loved—skillful, honest mechanics

### III.

#### THE LAW OF LIVING.

At 22 years of age Franklin wrote his Articles of Belief and Self-improvement. Acts of Religion, in which he laid down his First Principles. This was his earliest serious effort in self-education in morality. The Principles are a liturgy and a book of prayer, and if the spirit which animated them be accepted as the motive of Franklin's life, it indicates a large purpose to "attain perfection in morals." The whole effort is of a piece with his notion of self-culture—that by self-application man can attain, through the results of personal experiment, perfection in almost any art.

Two years later, in 1780, in his Rules for a Club Established for Mutual Improvement (the celebrated Junto rules), he applied his principles of self-education by cooperating with kindred spirits, and took the first steps toward the characteristic acts of his life—the establishment of useful relations with his fellow-men. The use which he made of the Junto, of which I have already spoken, indicates the large value which he set upon such association. It would be untrue to say that Franklin was the founder of the first debating clubs in America, but it is not untrue that he was the founder of the most useful debating club which ever existed in this country, for the living influence of the Junto exists to this day, and its usefulness is measureable by the influence of the American Philosophical Society, of which it was the beginning.

He applied the famous maxim of Horace, that use is the law of life. Use is the law of speech, and it became to him the law of education. He learned to write by writing. His numerous contributions to the newspapers gave him practice. In 1741 he began the first American magazine.<sup>a</sup> His paraphrases of the *Spectator* in his brother's newspaper in Boston, under the pseudonym of "Silence Dogood," were followed by many articles in varying form, improving, we may say, until they attained perfection. The public welfare was the subject of his story, and all of his contributions were written for the common pleasure and instruction. The *Busybody*, a series of papers contributed to the *Weekly Mercury*, the first newspaper published in Philadelphia, are indisputably among the first of Franklin's writings, though his own reference to the earlier *Silence Dogood* papers are evidence that they were his own. He says in the first number of the *Busybody*: "I have lately entertained some thought of setting up for an author myself, not out of the least vanity, I assure you, or desire of showing my parts, but purely for the good of my country."

These early papers, written in his twenty-third year, show many of the author's characteristics, both in subject and style, and have proved the truth of his favorite idea in English composition—that by much, frequent, and careful writing one may attain unto a simple and direct style. Franklin may be said to be the first American newspaper man, for he was the first American writer to use simple English in brief sentences addressed directly to the public. He may be called the founder of the brief, sententious style in journalism.

In 1729 he published *A Modest Inquiry into the Nature and Necessity of a Paper Currency*, a small pamphlet which marks an epoch in the history of political economy. It opens with a characteristic confession: "There is no science the study of which is more useful and commendable than the knowledge of the true interest of one's country."

It would be interesting to note particularly the frequency with which he uses the phrase "the true interests of one's country," or "the general welfare of one's country."<sup>b</sup> In this *Modest Inquiry* he discusses the nature of a paper currency in a general way, as shown by a scarcity of money and a high rate of interest. That the scarcity of money in a country discourages immigration was a point of great interest to one, like Franklin, who was ever discussing the means for encouraging the increase of population. As his theory of the general welfare was based upon his interpretation of the interests of an ever-increasing and prosperous people, he laid it down as an economic principle that "a plentiful currency will encourage great numbers of laboring and handicraftsmen to come and settle in the country." He thought that "want of money in such a country as ours occasions a greater consumption of English and European goods, in proportion to the number of people, than there would otherwise be." This notion is in keeping with one of his favorite ideas, expressed by him in 1771, that "every manufacture in our country makes an opportunity for a market for productions within ourselves, and supplies so much money to the country as must otherwise be exported to pay for the manufacture of supplies here in England; it is well known and understood that wherever a manufacture is established that employs a number of hands, it raises the value of land in the neighboring country all around. It seems, therefore, the interest of our farmers and owners of land to encourage our own manufactures in preference to foreign ones."

In other words, his idea of a nation was like his idea of the individual—that the nation, like the individual, should be self-supporting. This conformed to the

<sup>a</sup> The *General Magazine and Historical Chronicle for all the British Plantations in America*. It was a monthly, and was published from February to July.

<sup>b</sup> For the history of the phrase see my *Constitutional History of the United States*, Vol. III, Bk. VI, Ch. VI.

education which he had received in his New England home and was characteristic of the New England idea in government.

It is interesting to trace as early as 1729, in his writings, this plain intimation of the means for the true prosperity of America that traders, artificers, laborers, and manufacturers should produce the goods in America needed for America. It is in this paper on currency that he lays down the fundamental notion in economics that labor is the measure and creator of wealth:

For many ages [he says] those parts of the world which are engaged in commerce, having fixed upon gold and silver as the chief and most proper materials for this medium [that is, money properly called a medium of exchange]; they being in themselves valuable metals for their fineness, beauty, and scarcity. By these, particularly by silver, it has been usual to value all things else. But as silver itself is of no certain permanent value, being worth more or less according to its scarcity or plenty, therefore it seems requisite to fix upon something else, more proper to be made a measure of values, and this I take to be labor.<sup>a</sup>

By labor may the value of silver be measured as well as other things. As, suppose one man employed to raise corn, while another is digging and refining silver; at the year's end, or at any other period of time, the complete produce of corn, and that of silver, are the natural price of each other; and if one be 20 bushels, and the other 20 ounces, then an ounce of that silver is worth the labor of raising a bushel of that corn. \* \* \*

Thus the riches of a country are to be valued by the quantity of labor its inhabitants are able to purchase, and not by the quantity of silver and gold they possess, which will purchase more or less labor, and therefore is more or less valuable, as is said before, according to its scarcity or plenty.

This doctrine of labor, stated in 1729, anticipated the Wealth of Nations forty-six years, and justly may lay claim to priority in statement of the foundation of the industrial basis of modern political economy.<sup>b</sup> He applied his doctrine as it affected the currency by affirming that "money as bullion, or as land, is valuable by so much labor as it costs to procure that bullion or land; money, as a currency, has an additional value by so much time and labor as it saves in the exchange of commodities." Mindful of his rule for humility and modesty, Franklin concluded the essay by saying:

As this essay is wrote and published in haste, and the subject in itself intricate, I hope I shall be censured with candor if, for want of time carefully to revise what I have written, in some places I should appear to have expressed myself too obscurely, and in others am liable to objections I did not foresee. I sincerely desire to be acquainted with the truth, and on that account shall think myself obliged to anyone who will take the pains to show me or the public where I am mistaken in my conclusions.

The effect of this pamphlet in Pennsylvania was the issue of a paper currency.

His fondness for dialogues had led him, in his scheme for an English school, to prescribe their composition. Throughout his writings occur many dialogues on a great variety of subjects.

<sup>a</sup> This idea is elaborated in *The Wealth of Nations*, Book I. See also J. S. Mill's *Principles of Political Economy*, Book I.

<sup>b</sup> Since this was written there has appeared a monograph by W. A. Wetzel, A. M., in the Johns Hopkins University Studies, entitled *Benjamin Franklin as an Economist*, in which the author, in a chapter on Value, denies the correctness of the statement that Franklin can be called "the father of the labor theory of value." He says:

It is true that as early as 1729, in his first paper of an economic character (i. e., *The Nature and Necessity of a Paper Currency*, Bigelow's edition of *Franklin Works*, vol. I, p. 371), Franklin states this theory very fully. But the close resemblance between his language and that of Sir William Petty, who preceded him by more than fifty years, leads one to conclude that Franklin, who lived in London in 1724, must have known of Petty's work (p. 31).

Mr. Wetzel reprints from Petty's *Essay on Taxes and Contributions*, which appeared in 1662, and from Franklin's paper of 1729, and remarks: "The same commodities are compared in the same ratios, and the same Latin phrase used at the end."

He was fond of the theater. Action, expression, relieved the tedium of mere writing. Had he possessed the leisure he might have written a play. The use of dialogue in composition is out of fashion in our time, but was much in vogue in the eighteenth century. Franklin was a master of it. Many will remember the dialogues in the old school readers. They will recall "speaking day," when these dialogues were mouthed from the stage, and some wholesome lesson in politics or morality was given to the audience. Some of the most celebrated found in the old readers were written by Franklin himself, as the famous dialogue between him and the gout.

His utilitarian ideas appear throughout his writings. To the *Pennsylvania Gazette* of October 30, 1735, he contributed a paper on the usefulness of mathematics. His own course in arithmetic and geometry, it will be remembered, was brief. His paper on the usefulness of mathematics was based upon their commercial value. It was because "no business, commerce, trade, or employment whatsoever, even from the merchant to the shopkeeper, etc., can be managed and carried on without the assistance of numbers; for by these the trader commutes the value of all sorts of goods that he dealeth in, does his business with ease and certainty, and informs himself how matters stand at any time with respect to men, money, or merchandise, to profit and loss, whether he goes forward or backward, grows richer or poorer."

We must not forget that in 1735 there were no common schools or common facilities for the education of the poor, and that the occasion for self-education was greater then than now.

Illiteracy was prevalent, and the means for acquiring a knowledge of the rudiments of an English education depended almost wholly upon the activity of the individual. Now, when public education is a part of modern life, Franklin's appeal for self-education loses much of its original force. His vast influence in America is explicable when we reflect that he spoke to a people who were lacking the very facilities which now are within reach of any enterprising person. Franklin was an American educator before there were American schools.

In his paper on mathematics he made no argument for the study of the subject as a science. Study it for its utility in mechanics, in navigation, in surveying, in engineering, and in the computation of time and its divisions; as a method of strengthening the mind, of securing the capacity for exact reasoning, of discerning truth from falsehood. He concludes his argument with a quotation from Plato characteristic of his own notions of life: "Dear friend, you see, then, that mathematics are necessary, because, by the exactness of the method, we get a habit of using our minds to the best advantage."

At thirty years of age he wrote his first paper on government. It is of interest because of his subsequent influence in international matters, and in the formation of the constitutions of Pennsylvania in 1776 and 1789, and in the making of the National Constitution in 1787. His paper on government, written forty years before the first constitution of an American commonwealth was, contains the germs of all the American constitutions. Government is "created by and for the good of the whole," and "should be made liable to the inspection and animadversion of the whole." "Sovereignty is in the people;" and he concludes with the rather mischievous maxim, "*Vox dei est populi vox.*" He adds this qualification, that "this maxim is universally true while the people remain in their proper sphere, unbiased by faction, undeluded by the tricks of designing men." Later this same idea was incorporated in his final speech to the convention of 1787.

It is in this early paper that he anticipated a thought expressed forty years later in the Declaration of Independence, that "the civil privileges of the Ameri-

can people are not a gift bestowed upon us by other men, but a right that belongs to us by the laws of God and nature." <sup>a</sup>

He based his idea of government upon his interpretation of the public good, and declared the foundation of government to be the common rights of mankind. It is interesting as an intimation of his subsequent career in public affairs.

Of all his writings the one which has been most widely read is his *Way to Wealth*,<sup>b</sup> written in 1736, the great number of editions indicating its widespread influence. Known also under the titles of *La Science du Bonhomme Richard*, and *Father Abraham's Speech*, it is the best known of American writings. Mr. Paul Leicester Ford, a distinguished worker in the vineyard of Franklinian literature, tells us that "Seventy editions of it have been printed in English, 56 in French, 11 in German, and 9 in Italian. It has been translated into Spanish, Danish, Swedish, Welsh, Polish, Gaelic, Russian, Bohemian, Dutch, Catalan, Chinese, Modern Greek, and Phonetic writing. It has been printed at least 400 times, and is to-day as popular as ever." The paper, addressed to the "Courteous Reader," assumes to be taken from the proverbs of an old almanac entitled "Poor Richard Improved." Probably this paper reflects Franklin's mind in its everyday economy more perfectly than any other he wrote. It is an epitome of homely experiences, told in the easy style of which he was master, and addressed to the public, whom he always had in mind. It is a series of maxims, skillfully strung together, illustrative of his favorite notion that industry, economy, and virtue are the means for attaining perfection in this life. Portions of the paper have been printed in reading books so frequently that it has become one of the best known of American writings. It is perhaps safe to say that in this single article Franklin contributed to the education of his countrymen in practical economy as no other American has ever done.

Between 1736 and 1750 he contributed frequently to the newspapers, ever writing on some useful project. It was in 1749 that he made application of his utilitarian doctrines. He conceived of the identity of electricity and lightning, and began that train of thought which ended three years later in his famous experiment with the kite. This experiment led to his invention of the lightning rod. He never protected his discoveries by patent, believing that as he had received much from mankind he himself should contribute as freely as possible to the general welfare. During the next twelve years following 1750 he won his fame as an electrician. He obtained his knowledge by simple experimentation. He was a born scientist. His own life led him to emphasize the value of experiment in education, although in his *Proposals for the Education of Youth in Pennsylvania* he does not prescribe laboratory work, as at first thought one might have expected him to do.

His purpose utilitarian. He made no effort to defend or perpetuate his own fame as a scientist, but left it to the considerate judgment of mankind.

This was characteristic of all his work. He judged himself as he judged others—by the usefulness of his life to mankind; he strictly applied his utilitarian doctrines to himself. It is to be noticed in his numerous letters to Peter Collinson and others concerning his electrical experiments that his ideas

<sup>a</sup> Compare the opening paragraph of the Declaration of Independence: "When, in the course of human events, it becomes necessary for one people to dissolve the political bands which have connected them with another, and to assume, among the powers of the earth, the separate and equal station to which the laws of nature and of nature's God entitle them, a decent respect to the opinions of mankind requires that they should declare the causes which impel them to the separation."

<sup>b</sup> The Sayings of Poor Richard; The Prefaces, Proverbs, and Poems of Benjamin Franklin, Collected and Edited by Paul Leicester Ford, form one of the "Knickerbocker Nugget" Series. G. P. Putnam's Sons.

follow the experiment rather than anticipate it. He kept close to phenomena and showed no haste to experiment merely for the sake of experiment. All his tests were for utilitarian purposes.

In his *Advice to a Young Tradesman*, written in 1748, he applied some of the notions already expressed in his *Way to Wealth*, and signed himself "An Old Tradesman." His frequent papers upon money-getting have caused some critics to maintain that his whole scheme was a penny-wise pound-foolish policy and that his sole purpose in life was to accumulate wealth. It seems to me, on the contrary, that his life illustrates the opposite policy, for, having accumulated a fortune before he was 50 years old, a very unusual thing to do in the American colonies, he was enabled to utilize his time for the benefit of the public. His scheme of life was to win wealth in order to obtain time for self-improvement. He would have every man accumulate sufficient wealth to enable him to make innumerable experiments in virtue and natural philosophy, by means of which the general welfare might be promoted.

This is illustrated in a letter to George Whitefield, written  
How reforms should begin. July 6, 1749:

I am glad to hear that you have frequent opportunities of preaching among the great. If you can gain them to a good and exemplary life, wonderful changes will follow in the manner of the lower ranks, for *ad exemplum regis*, etc. On this principle Confucius, the famous Eastern reformer, proceeded. When he saw his country sunk in vice, and wickedness of all kinds triumphant, he applied himself first to the grandes, and having, by his doctrine, won them to the cause of virtue, the commons followed in multitudes. The mode has a wonderful influence on mankind, and there are numbers who perhaps fear less the being in hell than out of the fashion. Our most western reformation began with the ignorant mob; and when numbers of them were gained, interest and party views drew in the wise and great. Where both methods can be used, the reformations are likely to be more speedy. O, that some method could be found to make them lasting! He who discovers that will, in my opinion, deserve more, ten thousand times, than the inventor of the longitude.

He was a believer in the force of example, and his belief was  
The secret of life. based upon his own experience in self-education. Probably no American has illustrated the thought, *ad exemplum regis*, as he has. His life has been the pattern for thousands, and in innumerable stories, essays, sermons, and speeches he has been held up as an example for American youth. In his own scheme for the education of children he emphasized the value of the study of history and biography, because of the examples which these set before the mind. Posterity has treated him gently. No better illustration of his influence can be cited than Auerbach's Villa on the Rhine, in which story Franklin is the happy example for others to follow. The Franklin of Thackeray's *Virginians* is a caricature.

In a letter to his mother, written in his forty-third year, he says of himself:

For my own part, at present, I pass my time agreeably enough; I enjoy through mercy a tolerable share of health. I read a great deal, write a little, do a little business for myself, and now and then for others, retire when I can, and go into company when I please. So the years roll on, and the last will come, when I would rather have it said, "He lived usefully" than "He died rich."

At the time of his founding the University of Pennsylvania he had occasion to write to Dr. Samuel Johnson, first president of King's College, now Columbia University, to whom the provostship of the new university had been offered.

I think with you that nothing is of more importance for the public weal than to form and train up youth in wisdom and virtue. Wise and good men are, in my opinion, the strength of a State; much more so than riches or arms, which, under the management of ignorance and wickedness, often draw on destruction, instead of providing for the safety of the people. And though the culture bestowed on many should be successful only with a few, yet the influence of

those few and the service in their power may be very great. Even a single woman, that was wise, by her wisdom saved the city.

I think also that general virtue is more probably to be expected and obtained from the education of youth than from the exhortation of adult persons; bad habits and vices of the mind being, like diseases of the body, more easily prevented than cured.

I think, moreover, that talents for the education of youth are the gift of God, and that he on whom they are bestowed, whenever a way is opened for the use of them, is as strongly "called" as if he heard a voice from heaven; nothing more surely pointing out duty in a public service than ability and opportunity of performing it.

Dr. Johnson declined the provostship, and Dr. William Smith was chosen.

The University was not associated with any particular church, but it sought to be at peace with all the religious sects.<sup>a</sup>

Franklin had to contend with the prejudices of his times. The history of the University of Pennsylvania shows the effect of this early separation of academic and ecclesiastical interests. The university never had a theological school; its faculties, "as strongly 'called' as if they heard a voice from heaven," have been gathered from all sects, and the whole character of the institution has been free from ecclesiastical bias. Without doubt, this condition explains the lack in that university of that Western influence so characteristic of Harvard, Yale, and Princeton. It is true that the university, having established the first medical school in America, was the parent of all the medical schools of the West, but it

was the young clergymen and schoolmasters freshly graduated from Harvard, Princeton, and Yale who molded public opinion in the Northwest Territory, and the graduates of the University of Virginia who laid the foundations of schools in the region south of the Ohio. The New England immigrants imparted to the States west of the original 13 much of their original zeal for education.<sup>b</sup>

But Franklin was wise in his generation and his far-sightedness is now evident. Ecclesiasticism has given place to nonsectarianism in the great American universities, but we must not forget that during the half century which followed the American Revolution, when the West was receiving its immigrants from the older States, the vast ecclesiastical influence of New England carried with it the influence of Harvard and Yale. If Franklin had been a devout churchman and had identified the University of Pennsylvania with a powerful ecclesiastical body, doubtless the influence of that university throughout the West would have been greater than it was during the first half of the nineteenth century. Now, however, the world has caught up with Franklin's idea, and great universities have

<sup>a</sup>American education [says Robert Ellis Thompson] was begun by the churches, and the higher institutions of learning nearly all originated with the ecclesiastical bodies, and most of them are still under their control. The University of Pennsylvania, through the influence of Franklin, was perhaps the first to arise without formal connection with the churches. The colleges and academies of the New England States and of districts supplied from New England were chiefly modeled after Harvard, and nearly all drew their teachers from these mother institutions and their daughters. Those of the Middle and many of the Western States may commonly be traced to the educational efforts of the Presbyterian clergy from the north of Ireland and from Scotland. The Puritan and Presbyterian congregations have been the chief agencies in our higher educational system, and in both cases the interest and the mode was ecclesiastical. Religion, it would appear, was the only force at work in American society which at that time was strong enough to overcome the American passion for money-making to insist on the excellence of a liberal education, and thus to cherish a love of learning and of science until it grew strong enough to stand alone. Only in our own days have institutions of the same character been endowed in a few places by the State government.—(*Elements of Political Economy*, p. 372.)

<sup>b</sup>The Ohio land companies (1783-1800) were directed by men who favored a system of education at public expense and laid the foundation of the public-school systems of the West. (See Jay A. Barrett's *Evolution of the Ordinance of 1787*, pp. 11, 64; *Constitution of Ohio*, 1802, Art. VIII., sec. 27, and the enabling act for Ohio, April 30, 1802, sec. 6.)

been established in later years as free from ecclesiastical association as was the University of Pennsylvania in 1740-1749. It would be an interesting subject, which it is hoped some one may be pleased to pursue, to trace the influence of the church upon the educational institutions of America, and to show the causes which have led at last to the foundation of institutions of learning upon a nonsectarian basis. It is interesting, indeed, that the first institution so founded was Girard College, a school which in most of its provisions applies Franklin's ideas in education.

Franklin's letter to Dr. Johnson is of particular interest in the history of education. It went far to correct a notion, prevalent in the eighteenth century, and not wholly dead yet, that talents for the education of youth are not a gift of God. It must have been a strange doctrine to puritan ears that a teacher was "as strongly 'called' as if he had heard a voice from heaven."

In his *Observations Concerning the Increase of Mankind and Population in the Peopling of Countries*, written in 1751, Franklin attempted to solve another problem in economics. He was the first to point out that population increases more rapidly in America than in Europe, and that the increase was due to the ease and convenience of supporting a family in America, incident to the demand for labor and the abundance and cheapness of land. The population of America must "at least be doubled every twenty years," but notwithstanding this increase, "so vast is the territory of North America that it will require many ages to settle it fully; and, till it is fully settled, labor will never be cheap here, where no man continues long a laborer for others, but gets a plantation of his own; no man continues long a journeyman to a trade, but goes among those new settlers and sets up for himself."

In proportion to the increase of the population of the colonies there had been an extraordinary demand for British manufactures, making, said Franklin, a "glorious market wholly in the power of Britain, in which foreigners can not interfere, which will increase in a short time even beyond her power of supplying, though her whole trade should be to her colonies: therefore Britain should not too much restrain manufactures in her colonies."

This good advice was wholly lost, though it was given twenty-five years before the Declaration of Independence. It is in these observations that Franklin applied his ideas of labor to slavery:

It is an ill-grounded opinion that by the labor of slaves America may possibly vie in cheapness of manufactures with Britain. The labor of slaves can never be so cheap here as the labor of workmen is in Britain. \* \* \* Why, then, will Americans purchase slaves? Because slaves may be kept as long as a man pleases or has occasion for their labor, while hired men are continually leaving their masters (often in the midst of his business) and setting up for themselves.

This was his first discussion of slavery in America, to which subject he gave earnest attention for the remainder of his life, ever advocating abolition. The principal idea of the paper was the future of the English race. He thought that were earth "emptied of other inhabitants it might in a few ages be replenished from one nation only, as, for instance, with Englishmen." He then entered upon one of his favorite diversions, namely, computing the population of North America:

Thus there are supposed to be now upward of 1,000,000 English souls in North America (though it is thought scarce 80,000 have been brought over sea), and yet perhaps there is not one the fewer in Britain, but rather many more, on account of the employment the colonies afford to the manufacturers at home. This million doubling, suppose but once in twenty-five years, will, in another century, be more than the people of England, and the greatest number of Englishmen will be on this side of the water.

Franklin and Mal- This tract suggested the celebrated Essay on Population by  
thus. Malthus.<sup>a</sup> The sentence "this million doubling, suppose but  
once in twenty-five years, will, in another century, be more  
than the people of England," seems to have suggested to Malthus that population  
is destined to outrun the means of subsistence as an arithmetical ratio falls behind  
a geometrical. Malthus published his essay in 1820. William Godwin wrote a  
reply to Malthus, having first attempted to break down Franklin's statement:<sup>b</sup>

Dr. Franklin [Godwin says] is in this case particularly the object of our attention, because he was the first man who started the idea of the people of America being multiplied by procreation so as to double every twenty-five years. Dr. Franklin, born in Boston, was eminently an American patriot, and the paper from which these extracts are taken was expressly written to exalt the importance and glory of his country.

Franklin may thus be regarded as the first to call attention in the economic world to the ratio between the increase of population and the means of its subsistence. Political economists have ever since been engaged in the effort to determine this ratio with accuracy.

That Franklin should have been the first to formulate the doctrine that labor is the wealth-producer, thus anticipating Adam Smith, and should have first suggested the law of the increase of population, anticipating Malthus, places him among the great economists of the world.

Classics vs. modern He was not wholly in sympathy with all of Dr. Smith's ideas  
languages. in education. They were far in advance of the prevailing sentiment of the times and are substantially embodied in the four years' course prevailing at present. The University of Pennsylvania was the first American institution to adopt the four years' curriculum common now throughout the country. Much has been written of Franklin's relations to Dr. Smith, and there is a diversity of sentiment concerning them. It seems by the evidence that Dr. Smith leaned to the classical studies while Franklin preferred the English branches. This may possibly be explained by the difference in the education of the two men. Franklin would have all young men trained as he had trained himself; Dr. Smith, a fine classical scholar, would place Latin and Greek above the English language in the course. To these fundamental differences between the two men was added the disputes growing out of the relations of the academy and the college to the Commonwealth of Pennsylvania, and the contentions following the war of the Revolution. The college narrowly escaped destruction amidst these serious commotions.

In 1754 Franklin drew a plan of union for the colonies known as the Albany plan. It illustrates his love of compromise. The plan, as first drawn, is called Short Hints towards a Scheme for Uniting the Northern Colonies. While the commissioners from the colonies who assembled at Albany met for the ostensible purpose of discussing Indian affairs, the subject of colonial union was the uppermost thought in Franklin's mind. The union he proposed was to be based on the representative idea. A governor-general was to be appointed by the king, having a salary from the Crown and a veto on the acts of the grand council, the latter to be chosen by the colonial legislature and to consist of one member from each of the smaller colonies and two or more from each of the larger. It was an effort to establish for the colonies a government similar to that now existing in Canada, and was in its nature a federal act. Franklin says of the plan: "The assemblies all

<sup>a</sup> Mr. Wetzel thinks that it is claiming too much to say that "Franklin's work suggested Malthus's Essay on Population," but concludes that "one is led to believe that the influence of Franklin may be seen in Malthus's preventive check to the increase of population." (Pp. 28-29 of Wetzel's Benjamin Franklin as an Economist.)

<sup>b</sup> See Bigelow, Vol. II, 232, note.

thought there was too much prerogative, and in England it was thought to have too much of the democratic, and therefore the plan was not adopted.<sup>a</sup>

In 1755 his experiments in killing fowls by electricity led him to record: "Too great a charge might indeed kill a man." \* \* \* It would certainly, as you observe, be the easiest of all deaths," thus anticipating modern electrocution.

His utilitarian philosophy was illustrated again in a letter to George Whitefield, July 2, 1756:

Life, like a dramatic piece, should not only be conducted with regularity, but, methinks, it should finish handsomely. Being now in the last act, I begin to cast about for something fit to end with; or, if mine be properly compared to an epigram, as some of its lines are but barely tolerable, I am very desirous of concluding with a bright point. In such an enterprise I could spend the remainder of life with pleasure, and I firmly believe God would bless us with success if we undertook it with a sincere regard to His honor, the service of our gracious king, and (which is the same thing) the public good.

In this letter he thanked Whitefield for his "generous benefactions to the German schools. They go on pretty well," he wrote, "and will do better when Mr. Smith,<sup>b</sup> who has at present the principal charge of them, shall learn to mind party writing and party politics less and his proper business more, which I hope time will bring about.

In 1760 in a letter to Lord Kames, dated May 3, he acknowledged the receipt of the *Principles of Equity*, "which," says Franklin, "will be of service to the colony judges, as few of them have been bred to the law," and he therefore sent his copy to a particular friend in Philadelphia, one of the judges of the supreme court in Pennsylvania. It is in this letter that he outlines "a little work for the benefit of youth, to be called *The Art of Virtue*."

Most people have naturally *some* virtues, but none have naturally *all* the virtues. To *acquire* those that are wanting, and secure what we acquire, as well as those we have naturally, is \* \* \* as properly an art as painting, navigation, or architecture. If a man would become a painter, navigator, or architect, it is not enough that he is *advised* to be one, that he is *convinced* by the arguments of his adviser, that it would be for his advantage to be one, and that he resolves to be one, but he must also be taught the principles of the art, be shown all the methods of working, and how to acquire the habits of using properly all the instruments; and thus regularly and gradually he arrives, by practice, at some perfection in the art. If he does not proceed thus, he is apt to meet with difficulties that discourage him, and make him drop the pursuit.

He would have youth become virtuous as he would have them become "tolerable English writers," by practice, and the method is exploited in his writings again and again.

His ideas concerning the future of America were optimistic, of great moment, and deserve attention. He firmly believed that Canada should share the fate of the thirteen colonies and form with them a united America. This notion was outlined in a pamphlet entitled, *The Interest of Great Britain with regard to our Colonies and the Acquisition of Canada and Guadaloupe*, written in 1760. It seems strange to us that any English statesman should have considered Guadaloupe more valuable to the British Empire than Canada. Franklin prevailed, however, and Canada was

<sup>a</sup>For an account of this and other plans of colonial union, see my *Constitutional History of the United States*, Vol. I, Book I, Ch. VI.

<sup>b</sup>The ill feeling between Smith and Franklin already referred to was intensified by the heat of local politics, but it seems that the contention between them gradually ceased, and so completely that Dr. Smith accepted the invitation to pronounce the eulogy upon Franklin at the time of his death.

retained. Had his views prevailed at the time of the treaty of peace in 1783, Canada would now be a part of the United States.

In the same year, September 27, addressing David Hume from Coventry, he says, referring to a pamphlet on the constitution and government of Pennsylvania long attributed to Franklin, but probably only brought out by his patronage and not written by him:

I am not a little pleased to hear of your change of sentiment in some particulars relating to America, because I think it of importance to our general welfare that the people of this nation should have right notions of us, and I know no one that has it more in his power to rectify their notions than Mr. Hume. I have lately read with great pleasure, as I do everything of yours, the excellent essay on the Jealousy of Commerce.<sup>a</sup> I think it can not but have a good effect in prompting a certain interest, too little thought of by selfish man, and scarcely ever mentioned, so that we hardly have a name for it; I mean the *interest of humanity* or common good of mankind. But I hope, particularly from that essay, an abatement of the jealousy that reigns here of the commerce of the colonies, at least so far as such abatement may be reasonable.

This is one of the earliest, and perhaps the first, use of the phrase "the general welfare" as relating to America, a phrase destined to receive a more extended meaning as time passed, and at last become fixed in the public mind and be incorporated in the preamble of the Constitution of the United States.<sup>b</sup> Probably no philosopher of the eighteenth century contributed so much to the definition of the "general welfare" as David Hume. To his writings may be traced many of the causes both of the American and of the French revolutions, and Franklin's relations to him, their correspondence, and the influence which each had on the other are of great interest. If Hume precipitated the French revolution, Franklin may be said to have hastened the independence of the United States. Franklin educated the colonies to become independent.

In November, 1761, he wrote his thanks to Lord Kames for a copy of his Introduction to the Art of Thinking, and inquired after the Elements of Criticism, then in preparation, adding:

I promise myself no small satisfaction in perusing that work also, when it shall appear. By the first, you sow thick in the young mind the seeds of good sense concerning moral conduct, which, as they grow and are transplanted into life, must greatly adorn the character and promote the happiness of the person. Permit me to say that I think I never saw more solid, useful matter contained in so small a compass, and yet the method and expression so clear that the brevity occasions no obscurity. In the other you will, by alluring youth to the practice of learning, strengthen their judgment, improve and enlarge their understanding, and increase their abilities of being useful.

To produce the number of valuable men necessary in a nation for its prosperity there is much more hope from schemes of *early institution* than from *reformation*. And, as the power of a single man to do national service, in particular situations of influence, is often immensely great, a writer can hardly conceive the good he may be doing when engaged in works of this kind. I can not, therefore, but wish you would publish it as soon as your other important employments will permit you to give it the finishing hand.

With these sentiments you will not doubt my being serious in the intention of finishing my Art of Virtue. It is not a mere ideal work. I planned it first in 1732. I have from time to time made, and caused to be made, experiments of the method with success. The materials have been growing ever since. The form only is now to be given, in which I purpose employing my first leisure after my return to my *other* country.

<sup>a</sup> Essay on The Jealousy of Trade, No. XXVIII, in Hume's Collected Works; Nos. XXV, XXVI, XXVII, XXIX, XXX, XXXI, on Money, Interest, Trade, Taxes, and Public Credit, are interesting in relation to Franklin's notions on those subjects.

<sup>b</sup> For the history of the phrase, "the general welfare," as used in the Constitution of the United States, see Thorpe's Constitutional History of the United States, 1765-1895. Vol. III, pp. 467-470.

Evidently he considered his proposed Art of Virtue as the magnum opus of his life. Whenever he received a work from a distinguished author he was quite likely to refer to this proposed work of his not as an ideal or theoretical thing, but as one of great practical utility. Somewhat conscious of his own infirmities, he thought he might atone for them by at least suggesting to others how they might improve in the art.

On the 10th of May, 1762, Hume, writing to Franklin from Franklin and Edinburgh on a device for protecting houses from stroke by lightning, remarked, "I thought it proper to convey to you these two ideas of so ingenious a man, that you might adopt them if they appear to you well founded. I am very sorry that you intend soon to leave us. I am sure America has sent us many good things—gold, silver, sugar, tobacco, indigo, etc.—but you are the first philosopher, and indeed the first great man of letters for whom we are beholden to her." This letter is evidence of the sympathy between Hume and Franklin,<sup>a</sup> who in reply, nine days later, regretted leaving a country in which he had received so much friendship and friends whose conversation had been so agreeable and so improving to him.

Public events soon withdrew Franklin from his scientific studies and he was wholly occupied with the measures of Parliament. In a letter to Charles Thompson, later secretary to Congress, July 11, 1765, he declared:

Depend upon it, my good neighbor, I took every step in my power to prevent the passing of the stamp act. Nobody could be more concerned and interested than myself to oppose it sincerely and heartily. But the tide was too strong against us. The nation was provoked by American claims of independence,<sup>b</sup> and all parties joined in resolving by this act to settle the point. We might as well have hindered the sun's setting. That we could not do. But since it is down, my friend—and it may be long before it rises again—let us make as good a night of it as we can. We may still light candles. Frugality and industry will go a great way toward indemnifying us. Idleness and pride tax with a heavier hand than kings and parliaments. If we can get rid of the former, we may easily get rid of the latter.

It was a favorite idea with him that many ills incident to bad government are less than the ills which people voluntarily suffer from idleness and pride. He was constantly applying the formula of his moral algebra to the solution of some public question.

On the 3d of February, 1766, he was examined at the bar of the House of Commons. That long, severe, and exhaustive test by friends and enemies remains the clearest account which we have of the relations between England and the American colonies in the eighteenth century.

His practical knowledge of America, due largely to his experience as deputy postmaster of the colonies, and his wise observations made during his official journeys through them equipped him to be the advocate of the rights of his countrymen. For the first time the British Parliament heard a truthful account of America. I can only refer to this examination as an illustration of all that I have said of his method of conveying knowledge. It was the most important Socratic dialogue in which Franklin ever engaged.

He carefully distinguished between the right of the colonial assemblies to levy local or internal taxes and the right of Parliament to levy an external tax or duty, contending that there was not a single article imported into the northern colonies

<sup>a</sup> Perhaps no better summary of Franklin can be made than Knight's remark about Hume: "Even in the sentimental days of boyhood his estimates of men and things were based, with scarcely an exception, upon utility. He was essentially matter-of-fact from the first, and he remained unideal to the last. An acute observer, one of the keenest and cleverest of critics, he was never known to have been carried away by a fervor for what was above and beyond himself." (Knight's Life of Hume, p. 8.)

<sup>b</sup> I. e., independence of local taxation by Parliament.

which they could either not do without or make themselves; that with industry and good management they could very well supply themselves with all they wanted, and that it would not take a long time to establish manufactures among them. It was his opinion that before their old clothes were worn out they would have new ones of their own making. The whole examination shows that the Americans were prepared to be self-supporting, and it is interesting as a formulation of the principal points afterwards used by Adam Smith in his *Wealth of Nations* in illustration of his economic theories respecting new countries.

Meanwhile the influence of Hume, Voltaire, Turgot, Quesnay, and others, who in their philosophy had worked out a scheme for the regeneration of mankind, was rapidly precipitating the revolutions of 1776 in America and of 1789 in France. It will always be a matter of speculation to what extent Hume, Smith, and Franklin contributed to hastening these stupendous changes.

Among the brilliant thinkers of the eighteenth century were The physiocrats. a number of men known as the physiocrats, from the general title given in 1768 to the first volume of Quesnay's collected works, published by his disciple, Dupont de Nemours. The physiocrats sought a universal exposition of the wants of man and the satisfaction of these wants in the national constitution and order of human society. They held that government should be according to the nature of things. The world is governed by immutable physical and moral laws; it is for man, an intelligent and free being, to discover them and to obey them or violate them, for his own good or evil. The end assigned to the exercise of his intellectual and physical powers is the appropriation of matter for the satisfaction of his wants and the improvement of his condition, and the general accomplishment of this task conformably to the idea of the just, which is the correlative of the idea of the useful. Man forms an idea of justice and utility, both individual and social, through the notions of duty and right, which his nature reveals to him, and which teach him that it is contrary to his good and the general welfare to seek his own advantage in a damage to others.

This idea entering the minds of individuals and peoples in proportion to the increase of enlightenment and the advance of civilization, they naturally produce feelings of fraternity among men and peace among peoples. The chief manifestations of justice are liberty and property; that is to say, the right of each person to do that which shall in no way concern the general welfare and to use at his pleasure the things which he possesses, the acquirement of which has been conformable to the nature of things and to the general utility, since without liberty and property there would have been no civilization. Liberty and property spring, then, from the nature of man and are rights so essential that laws or agreements among men should be limited to recognizing them, to formulating them, and to saving them. Governments have no mission other than to protect these two rights, which, when things are correctly understood, embrace all the material and moral wants of society.

To say that liberty and property are essential rights is to say that they are in harmony with the general interest of the species; that is, with them land is more fertile, and the industry of man in its manifestations more productive, and the development of all his aptitudes—moral, intellectual, scientific, and artistic—swifter. They are in the field of the good and beautiful and just and useful; that is to say, through them man best gathers the fruit of his own efforts and is not at least the victim of the arbitrary laws of his fellow-men.

As the physiocrats were utilitarians, Franklin, whose visit to France occurred at the time when physiocracy was in fashion, became a disciple of Quesnay, whose notions that "the happiness of the majority depends much less on the mechanism of governmental forms than on the development of human industry, and that it is impossible to discuss

Franklin and the  
physiocrats.

politics rationally without having previously acquired a knowledge of the economy of society," were exactly to Franklin's mind. Franklin's works, both before and after 1768, prove this. Adam Smith and the physiocrats combated the mercantile theory, which made wealth consist only in the precious metals and which exaggerated the advantages of foreign commerce. They combated also the then ruling infatuation for the manufacturing system. Franklin based his ideas of economy on agriculture, for he knew America, and America was then agricultural. The theory of the physiocrats that agriculture is the true basis of all government therefore appealed to him. In his letter of July 28, 1768, to Dupont he acknowledged "the most acceptable gift" of his *physiocratie* (*Origine et progrès d'une science nouvelle*)—

Franklin and Dupont de Nemours. Which [he adds] I have read with great pleasure, and received from it a great deal of instruction. There is so much freedom from local and national prejudices and partialities, so much benevolence to mankind in general, so much goodness mixed with the wisdom in the principles of your new philosophy that I am perfectly charmed with them and wish I could have stayed in France for some time to have studied in your school, that I might, by conversing with its founders, have made myself quite a master of that philosophy. I had, before I went into your country, seen some letters of yours to Dr. Templeman that gave me a high opinion of the doctrines you are engaged in cultivating and of your personal talents and abilities, which made me greatly desirous of seeing you. Since I had not that good fortune, the next best thing is that which you are so good as to offer me, your correspondence, which I shall ever value and endeavor to cultivate with all the diligence I am capable of. I am sorry to find that that wisdom which sees the welfare of the parts in the prosperity of the whole seems yet not to be known in this country [England]. \* \* \* It is from your philosophy only that the maxims of the contrary and more happy conduct are to be drawn, which I therefore sincerely wish may grow and increase until it becomes the governing philosophy of the human species, as it must be that of superior beings in better worlds. I take the liberty of sending you a little fragment that is somewhat tinctured by it, which on that account may be acceptable. Be so good as to present my sincere respects to that venerable apostle, Dr. Quesnay, and to the illustrious *Ami des Hommes* (of whose civilities to me at Passy I retain a grateful remembrance).

Dupont found it convenient during the French Revolution to emigrate to the United States. On his return to France he assisted Livingston and Monroe in negotiating the purchase of Louisiana. Later, at Jefferson's request, he prepared a scheme of national education for America, which was entitled "*Sur l'éducation nationale dans les États Unis*," was presented to Congress and published in 1812.

The influence of the physiocrats on Franklin is discernible in his speeches in the Constitutional Convention of 1787, particularly in the last to the delegates, which was read by Wilson just before the signing of the Constitution.<sup>a</sup>

Franklin's method of arriving at conclusions is outlined in his letter to Dr. Priestley, September 19, 1772. In order to get over the uncertainty and perplexity incident to making up his mind on a subject, he pursued a unique course:

My way is, to divide half a sheet of paper by a line into two columns; writing over the one *pro* and over the other *con*; then during three or four days' consideration, I put down under the different heads short hints of the different motives, that at different times occur to me, *for* or *against* the measure. When I have

<sup>a</sup>For the doctrines of the physiocrats see Quesnay's *Tableau Économique*, 1758; *L'Ami des Hommes*, 6 vols., 1755-1760; Turgot's *Réflexions sur la Formation et la Destruction des Richesses*. Adam Smith also has an instructive chapter on the physiocrats.

For an account of the survival of French influence in America and particularly of the work of Quesnay and Dupont and their distinguished associates in founding the Richmond Academy, and also a particular account of Dupont's treatise on national education, and the influence of that treatise at the time, see Thomas Jefferson and the University of Virginia, by Herbert B. Adams, Ph. D., United States Bureau of Education, Circular of Information No. 1, 1888, pages 21-30, 49-54. Washington, Government Printing Office, 1888.

thus got them all together in one view, I endeavor to estimate their respective weights; and, where I find two (one on each side) that seem equal, I strike them both out. If I find a reason *pro* equal to some two reasons *con*, I strike out the three. If I judge some two reasons *con* equal to some three reasons *pro*, I strike out the five; and thus proceeding I find at length where the *balance* lies; and if, after a day or two of further consideration, nothing new that is of importance occurs on either side, I come to a determination accordingly. And, though the weight of reasons can not be taken with the precision of algebraic quantities, yet, when each is thus considered separately and comparatively, and the whole lies before me, I think I can judge better, and am less liable to make a rash step; and in fact I have found great advantage from this kind of equation, in what may be called *moral* or *prudential algebra*.

This method of arriving at a conclusion could be suggested only by a man like Franklin, who based his judgments upon a comparison of conflicting claims and whose powers in forming conclusions were great. Who can measure how delicate is the diplomacy requisite to harmonize the conflicting powers that rage within the world of self? Throughout his plan for the education of youth he emphasizes the value of comparison as an essential element. No more curious or pertinent illustration can be found of his fondness for comparison than his prudential algebra.

How he perfected his style of composition. His deep sympathy with mankind and his love of books made him a prolific writer, and numerous short articles, not wholly unlike his old models in the *Spectator*, accumulated rapidly after 1770; but it should not be imagined that these apparently easy contributions, written for the pleasure of his friends, were not the result of great labor; the existence of several revisions of the original attest the labor with which the final form was reached, and some of these copies are so freely interlined as to be almost illegible. The perfect style of many of these bagatelles has led to their introduction into school readers, and thus by a happy destiny Franklin contributed to the education of youth many articles such as, in his Plan for an English School, he advised should be read by children. These short stories are among the English classics.

One of the few references to the civil service in his writings is found in his letter to Mr. Timothy, November 3, 1772:

I am sorry you talk of leaving off your business with a view of getting some post [that is, public office]; it is so difficult a matter to obtain anything of the kind that I think to leave a good trade in hopes of an office is quitting a certainty for an uncertainty and losing substance for shadow. I have known so many here [London] dangling and soliciting years for places until they were reduced to the lowest poverty and distress that I can not but pity a man who begins to turn his thoughts that way. The proverb says: "He who has a trade has a feast of profit and honor, because he does not hold it during another man's pleasure and it affords him an honest subsistence with independence." I hope, therefore, you will alter your mind and go on with your business.

This advice about office seeking has been mostly lost upon Americans.

His respect for the trades is well known. He never forgot that he had been an apprentice, and always took lively satisfaction in describing himself as a printer.<sup>a</sup> His utilitarian ideas found illustration in the improvement of utensils and instruments in daily use. For instance, in his letter of April 11, 1773, to William Deane, he knows of nothing new worth communicating from London, "unless perhaps the new art of making carriage wheels, the fellowes of one piece, bent into a circle and surrounded by a hoop of iron, the whole very light and strong, there being no crossed grain in the wood, which is also a great saving of timber. The wood is first steamed in the vapor from boiling water, and then bent by a forcible machine. I have seen pieces of wood so bent of 6 inches wide and 3½

<sup>a</sup> He so describes himself in his will. See p. 134.

thick into a circle of 4 feet diameter. These, for duration, can only be exceeded by your iron wheels. Pray, have you completed that ingenious invention?"

In this letter he describes one of his own recent inventions, <sup>The Franklin</sup> a smokeless stove. "I have completed my stove, in which the smoke of the coal is all turned into flame and operates as fuel in heating the room. I have used it all this winter, and find it answers even beyond my expectations. I propose to print a little description of its use and construction, and shall send you a copy." All of which he did soon after. He was the first to devise the smoke-consuming stove, the principle of which has been largely applied in the construction of railroad locomotives, in city factories, and should be much more widely used.

"The doctrines of life and death, in general, are yet but little understood," he writes to M. Dubourg, and proceeds to describe a toad that long imprisoned in a stone had come to life. The curious revival of the toad led Franklin to remark on an instance of common flies preserved in a manner somewhat similar:

They had been drowned in Madeira wine, apparently about the time it was bottled in Virginia to be sent later to London. At the opening of one of the bottles at the house of a friend where I then was three drowned flies fell into the first glass that was filled. Having heard it remarked that drowned flies were capable of being revived by being placed in the rays of the sun, I proposed making an experiment with these. They were therefore exposed to the sun upon a sieve, which had been employed to strain them out of the wine. In less than three hours two of them began by degrees to recover life. They commenced by some convulsive motions of the thighs, and at length they raised themselves upon their legs, wiped their eyes with their fore feet, beat and brushed their wings with their hind feet, and soon after began to fly, finding themselves in Old England without knowing how they came thither. The third continued lifeless till sunset, when, losing all hopes of him, he was thrown away.

This experiment was not lost on Franklin.

I wish it were possible, from this instance, to invent a method of embalming drowned persons in such a manner that they may be recalled to life at any period however distant; for, having a very urgent desire to see and observe the state of America a hundred years hence, I should prefer to any ordinary death the being immersed in a cask of Madeira wine, with a few friends, until that time, to be then recalled to life by the solar warmth of my dear country. But since in all probability we live in an age too early and too near the infancy of science to hope to see such an art brought, in our time, to its perfection, I must for the present content myself with the treat, which you are so kind as to promise me, of the resurrection of a fowl or a turkey cock.

In 1773 appeared his "Rules for reducing a great empire to a small one, presented to a late minister" (as is supposed), Lord Hillsboro. In this unique article he illustrated his sagacity in addressing the public in order to reach the ministry. Though the paper has lost much of its point by the lapse of time, it holds its place in the front rank of political satires. It eventually accomplished the end for which it was written—the enlightenment of the British public.

His utilitarian ideas found illustration again in the square tiles which, as many Americans will remember, ornamented the fireplaces and chimneys in the olden time. Franklin thought that the fireplace gave an opportunity for moral instruction. He advised an engraver in 1773 to borrow "from the bookseller's the plates that had been used in a thin folio called *Moral Virtue Delineated*, for the purpose of obtaining the pictorial illustrations." The Dutch Deift ware tiles were much used in America, "which are only or chiefly Scriptural histories wretchedly scrawled. I wish to have these moral prints, which were originally taken from Horace's poetical figures, introduced on tiles, which, being about our chimneys and constantly in the eyes of children when by the fireside, might give parents an

opportunity in explaining to impress moral sentiments." These notions of education might possibly have made the subject for a chapter in his *Art of Virtue*.

He lost no opportunity to make experiments in politics, morality, and natural philosophy. An instance of the last was his experiment to determine the effect of oil in stilling the waves in a storm. He relates in a letter of November 7, 1773, to Dr. Brownrig, how in his youth he had "smiled at Pliny's account of the practice among the seamen of his time to still the waves in a storm by pouring oil into the sea," and recollecting the account, he resolved to make some experiments of the effect of oil on water when he should have opportunity. After mentioning several experiments, he records: "After this I contrived to take with me whenever I went into the country a little oil in the upper hollow joint of a bamboo cane, with which I might repeat the experiment as opportunity should afford, and I find it constantly to succeed."

One of his experiments in morality was the abridgment of the Book of Common Prayer. In 1773 he spent some time at the seat of a nobleman of questionable morals, Lord De Lespencer, and assisted him in making the abridgment, and probably the preface. Franklin wished to adapt the Book of Common Prayer to the wants of "many pious and devout persons whose age or infirmities will not suffer them to remain for hours in a cold church, especially in the winter season," and of the younger sort, who "would probably more frequently, as well as cheerfully, attend divine service if they were not detained so long at any one time. Also many well-disposed tradesmen, shopkeepers, artificers, and others, whose habitations are not remote from churches, could and would, more frequently at least, find time to attend divine service on other than Sundays if the prayers were reduced into a much narrower compass."

The preface somewhat elaborately defends the changes which had been made, but the work attracted "little notice" and "the book became waste paper." However, the whole purpose of the abridgment was in keeping with Franklin's utilitarian ideas.

On the 21st of July, 1775, he brought forward in Congress a plan for the union of the colonies, called "Articles of confederation and perpetual union." They were the first of the kind, but there is no evidence from the journals or from references to the debates at the time that his articles were referred to a committee or generally considered. It was not until nearly six years had passed that similar articles <sup>a</sup> were adopted by the requisite number of States. The second article is of permanent interest, as it contains the elements afterwards united in the preamble to the national Constitution: "The said united colonies hereby severally enter into a firm league of friendship with each other, binding on themselves and their posterity, for their common defense against their enemies, the safety of their persons and families, and their mutual and general welfare."<sup>b</sup>

The articles are more like those adopted under the title of Articles of Confederation of 1777 <sup>c</sup> than the national Constitution of ten years later, but they suggest Franklin's ideas of government—the application of a utilitarian philosophy and the general democratic basis on which government should be founded.

He conceived the national idea. He conceived that a nation has permanency and the power of readjusting itself to new conditions. This is the national idea.

Of this idea he was the Northern exponent. He anticipated Lincoln in that he would found all civil institutions upon the essential interests of

<sup>a</sup> See the text of the articles, Bigelow, Vol. V, 548.

<sup>b</sup> See note p. 144.

<sup>c</sup> In 1776 Dickinson wrote the draft of the articles which, as amended, became the Articles of Confederation of 1781.

the people. Franklin, in 1776, bore the relation to the colonies which Lincoln bore to the new nation in 1863. Each opened an era in American history. Faith in the power of the people to adjust themselves to new conditions is repeatedly illustrated in the writings of both men.

In a characteristic article entitled, "A petition of the left hand to those who have the superintendency of education," written in 1779, Franklin made a plea for the equal training of the hands. He thought that children should be taught to use either hand with facility, and that the customary preference given to the right limited not only the usefulness of the left hand, but impeded the skill of the individual in the accomplishments of life. He anticipated Froebel in his idea of the free industrial training of the child and in the even development of all the functions and organs of the body.

Had international law not existed before his time he would have originated a system. His practical mind was ever seeking to ameliorate the condition of mankind, as is illustrated in a letter from Passy, May 30, 1780:

All the neutral States of Europe seem at present disposed to change what had before been deemed the law of nations, to wit, that an enemy's property may be taken wherever found, and to establish a rule that free ships shall make free goods. The rule is itself so reasonable, and of a nature to be so beneficial to mankind, that I can not but wish it may become general. And I make no doubt but that the Congress will agree to it in as full an extent as France and Spain.

This doctrine, that free ships make free goods, was a favorite one with him, and is frequently mentioned by him, as on the 5th of June, 1780, in a letter to Charles W. F. Dumas:

I approve much of the principles of the confederacy of the neutral powers, and am not only for respecting the ships as the house of a friend, though containing the goods of an enemy, but I even wish, for the sake of humanity, that the law of nations may be further improved by determining that, even in time of war, all those kinds of people who are employed in procuring subsistence for the species, or in exchanging the necessities or conveniences of life, which are for the common benefit of mankind, such as husbandmen on their lands, fishermen in their barques, and traders in unarmed vessels, shall be permitted to prosecute their several innocent and useful employments without interruption or molestation, and nothing taken from them, even when wanted by an enemy, but on paying a fair price for the same.

On the 15th of May, 1781, in a letter to Samuel Cooper, expressing sentiments on the adoption of the new constitution of Massachusetts,<sup>a</sup> he again declared his faith in the power of the people to adjust themselves to new conditions:

It gives me great pleasure to learn that your new constitution is at length settled with so great a degree of unanimity and general satisfaction. It seems to me upon the whole an excellent one, and that if there are some particulars that one might have wished a little different they are such as could not in the present state of things have been well obtained otherwise than they are, and if by experience found inconvenient, will probably be changed hereafter.

He regarded with disfavor the clause in the constitution of Massachusetts which provided for the support of the clergy by public taxation. He did not think it right to tax Friends and others, who, though not approving of the New England ecclesiastical system, were compelled to aid in its support, and he advocated that abolition of religious qualification which was effected in Massachusetts forty years later. By 1825 these restrictions had disappeared from nearly all the State constitutions. Franklin, like Jefferson, disapproved of both property and religious qualifications for the elector and advocated manhood suffrage.

<sup>a</sup>The constitution of 1780, the only one of the eighteenth century State constitutions now in force, was amended in 1820 so as to abolish religious qualifications.

The custom in America of planting rows of trees along our streets, which has added a touch of beauty to our towns, had his earnest approval. In a letter to Francis Hopkinson, December 24, 1782, he wrote:

I own I now wish we had two rows of them in every one of our streets. The comfortable shelter they would afford us when walking from our burning summer suns, and the greater coolness of our walls and pavements, would, I conceive, in the improved health of the inhabitants, amply compensate the loss of a house now and then by fire, if such should be the consequence. But a tree is soon felled, and, as axes are at hand in every neighborhood, may be down before the engines arrive.

It should be recorded, however, that the argument now common for the planting of trees—the additional beauty of the street—was not advanced by Franklin. It probably did not occur to him. He seldom, if ever, advocated the beautiful when the useful could possibly be the basis of an argument. He was somewhat of a Philistine in his notions, and made constant repetition of the useful and beneficial, which, though they resolve his whole scheme of education into a broad system promoting the general welfare, would be strengthened if embellished with an element of the beautiful. To Franklin the cooling shade of the tree and the consequent improved health of the inhabitants were the chief reasons for planting trees along our streets.

We search in vain in his writings for a few words that might intimate an occasional appreciation of a thing that was not merely an industrial improvement or an instrument for material comfort. He was deficient in the sense of the beautiful, and throughout his plan for the training of children and in the intimations of his ideas of education scattered through his works we can gather little that encourages the study of art for art's sake. He was, however, fond of simple music and was a discriminating listener. We should not forget that the American colonists were meagerly supplied with beautiful things; that their amusements were rude, and that they had few notions of the artistic. Franklin, too, was born in New England, and the barren though substantial comforts of his New England home always satisfied his ideals of life. He knew nothing of the artistic in his own culture, and made no provision for it in the training of others. We may say, then, that in the effort of modern American education to teach the beautiful in art, music, painting, and drawing, we have an education which was not begun by Franklin. But in our industrial schools, our technical schools, our manual-training schools, and our means for teaching and acquiring skill in the applied arts, we have the consummation of his most cherished notions in education. America owes nothing in art to Franklin.

From Bayne's journal we have a brief but interesting account of Franklin's conversations. John Bayne, an intimate friend of Sir Samuel Romilly, visited Franklin at Passy in August, 1783. It is of this visit that he wrote in his journal: "Of all the celebrated persons whom in my life I have chanced to see, Dr. Franklin, both from his appearance and his conversation, seemed to me the most remarkable."

The conversation on American politics led Franklin to express his belief in universal suffrage. He believed that "the all of one man was as dear to him as the all of another," though he excluded from participation in the suffrage minors, servants, and others liable to undue influence. We should not forget that at this time religious and property qualifications were required in nearly all the American States. Their abolition did not come until Franklin had been dead fifty years. His love of mankind led him to advocate manhood suffrage, and on this point he was a Jeffersonian.

In one conversation he advanced a favorite notion that he inclined "to doubt of the necessity of having teachers or ministers for the express purpose of instructing

the people in their religious duties." and approved of the system among the Friends, who have no preachers, their mode of instruction encouraging all to participate in the meeting who think themselves qualified to contribute to the welfare of their neighbors.

He thought that the general peace of Europe might be secured if the powers would "refer all disputes between each other to some third person, or set of men, or power. Other nations, seeing the advantage of this, would gradually accede, and perhaps in one hundred and fifty or two hundred years all Europe would be included." His mind was so universal in its consideration of the wants of mankind and he was so accustomed to consider matters of international concern that he arrived at the solution of international difficulties—arbitration—generations before it was actually employed. The humane and peaceful method of arriving at a judgment in disputes between nations, such as was witnessed in the settlement of the Alabama claims, conforms with his views expressed eighty-eight years before. This anticipation of the condition of international affairs of the future suggests again that he would have contributed to the world a system of international law had none existed before his day.

Amidst the cares of public office his mind turned to the scenes of his boyhood, and there is a delightful touch of infirmity in the confession of his feelings toward his native place, expressed in a letter to Samuel Mather, written at Passy, May 12, 1784:

I long much to see again my native place, and to lay my bones there. I left it in 1723; I visited it in 1733, 1743, 1753, and 1763. In 1773 I was in England; in 1775 I had a sight of it,<sup>a</sup> but could not enter, it being in possession of the enemy. I did hope to have been there in 1783, but could not obtain my dismission from this employment here, and now I fear I shall never have that happiness. My best wishes, however, attend my dear country,<sup>b</sup> *Esto perpetua!* It is now blessed with an excellent constitution: may it last forever!

Few indeed are there of New England birth who do not feel with Franklin a strong desire at times to revisit their native place. His wish that the constitution of his native State might be perpetual seems in process of fulfillment, for the constitution of 1780 remains the supreme law of Massachusetts.

The estimate now placed upon his work was held by his contemporaries. On the 26th of July, 1784, the Count de Campomanes, writing from Madrid, acknowledged through Mr. Carmichael a letter from Franklin and a collection of his miscellaneous writings:

All these writings exhibit proofs of their having proceeded from a statesman endowed with foresight and vigilant for the best interests of his country according to the political combinations and systems of government under which they were composed, and they manifest, at the same time, an ardent desire for the general happiness of mankind, founded on principles and calculations carried to as high a degree of demonstration as the vicissitude and inconsistency of the various systems adopted for the government of men will admit. Your views and reflections show the solidity and permanence of your principles, whether considered as applicable to the American colonies in their former condition or in that of independent States. In both cases your efforts have been directed to the general good without running into those extremes which are apt to lead astray weak minds in so long and arduous a contest, as we have seen in America, for the establishment of a new State consisting of 13 provinces under different constitutions and, at last, united in a bond of union for the mutual benefit of each other.

Nature, which you have profoundly studied, is indebted to you for investigating and explaining phenomena which wise men had not before been able to understand, and the great American philosopher, at the same time he discovers these phenomena, suggests useful methods for guarding men against their dangers.

<sup>a</sup> He was one of the commissioners of Congress to visit the American Commander in Chief.

<sup>b</sup> I. e., Massachusetts.

He was fond of suggesting the future greatness of America, its increasing population, its acquisition of territory, and the spread of the English language throughout the world. In a letter to William Strahan, written from Passy, August 19, 1784, he touches on this:

By the way, the rapid growth and extension of the English language in America must become greatly advantageous to the booksellers and holders of copyrights in England. A vast audience is assembling there for English authors—ancient, present, and future, our people doubling every twenty years—and this will demand large and, of course, profitable impressions of your most valuable books. I would, therefore, if I possessed such rights, entail them, if such a thing be practicable, upon my posterity, for their worth will be continually augmenting.

This is a prophecy of the circulation in America of Macaulay, Thackeray, Dickens, Tennyson, and other great English writers. The recent perfection of international copyright tends to the realization of Franklin's suggestion of "entailing" such rights for the benefit of the posterity of authors. In the same letter he says:

The subject, however, leads me to another thought, which is, that you do wrong to discourage the emigration of Englishmen to America. In my piece on "Population," I have proved, I think, that emigration does not diminish but multiplies a nation. You will not have fewer at home for those that go abroad; and as every man who comes among us and takes up a piece of land becomes a citizen, and by our Constitution has a voice in elections and a share in the government of the country, why should you be against acquiring by this fair means a repossession of it, and leave it to be taken by foreigners of all nations and languages, who by their numbers may drown and stifle the English, which otherwise would probably become in the course of two centuries the most extensive language in the world, the Spanish only excepted? It is a fact that the Irish emigrants and their children are now in possession of the government of Pennsylvania, by their majority in the assembly, as well as of a great part of the territory; and I remember well the first ship that brought any of them over.

His ideas on immigration.

The agitation of the question of immigration, based upon danger of stifling the Anglo-Saxon character of American institutions, suggests how accurate was Franklin's foresight. The occupation of Central and South America by Spain made the Spanish language one of the imperial languages of the world, and Spanish and English, a century after Franklin wrote this letter, are the two most extensively used languages in the New World. These wise judgments were based upon intuition rather than reason, for many of the data which would enter into such a conclusion were beyond his reach. We should not forget that facilities for acquiring the almost innumerable facts which now substantiate such conclusions were greatly limited in his time, and the comprehensive character of his mental operations becomes the more remarkable when we reflect upon the confines within which his observations were conducted. A case in point is Bryce's *American Commonwealth*, a remarkable book produced by a scholarly and sympathizing Englishman whose intuitions equipped him to describe American institutions. His reasons for the character of our institutions are, however, at times defective. In Franklin's philosophy there is a like dependence upon the intuitions. Franklin observed, felt, and knew. Speculation attracted him but little; he judged of the utilities almost wholly by intuition.

After the Revolution thoughtful Americans realized that the Articles of Confederation were defective and that a national constitution was necessary. This is not the place in which to follow minutely the thoughts and the work of Franklin for the National Constitution,<sup>a</sup> but there are several passages in his writings which illustrate his views:

Our Constitution seems not to be well understood with you [says he, writing to

<sup>a</sup> See note, p. 155.

George Whately from Passy, May 23, 1785]. If the Congress were a permanent body, there would be more reason in being jealous of giving it powers. But its members are chosen annually, can not be chosen more than three years successively, nor more than three years in seven; and any of them may be recalled at any time, whenever their constituents shall be dissatisfied with their conduct. They are of the people, and return again to mix with the people, having no more durable preeminence than the different grains of sand in an hourglass. Such an assembly can not easily become dangerous to liberty. They are the servants of the people, sent together to do the people's business and promote the public welfare; their power must be sufficient, or their duties can not be performed.

He did not highly value the mere forms of government, and his keen recognition of the essential and superior importance of administration over elaborate statements of the theory of government is repeatedly set forth in his writings from this time. Destined himself to participate in the making of the National

The administration v. the theory of government.

Constitution, it is interesting to follow the course of his own ideas, gained through a long and useful public life. He valued a useful administration of government, even a government defective in form, more highly than a good form of government badly administered.<sup>a</sup> Perhaps he displayed the strength of his practical judgment nowhere more instructively than in this appreciation of the importance of administration. The eighteenth century produced many eminent men who contributed to our knowledge of the theory of government, but it produced very few men who were able to set forth the principles by which government should be administered. In this respect Franklin stood almost alone—perhaps with the exception of Alexander Hamilton, quite alone. Both of these statesmen foresaw the great problem of our century, the problem of civil administration. We no longer debate, as did the Junto a hundred and fifty years ago, the theories and abstractions of government. Our practical affairs are administrative in their nature. Franklin illustrates the perennial freshness and modern character of his mind in his emphasis of the supreme importance of the administration of affairs. He was a citizen of all time.

#### IV.

##### THREE INTERPRETERS.

On his final return to America from Europe, in 1785, he was greeted by the assembly of Pennsylvania as "a person greatly instrumental in forming its free constitution."<sup>b</sup> As the weakness of the Confederation disclosed itself, suggestions for a "more perfect union" became frequent from the eminent men of the country. In writing to his beloved friend, Dr. Shipley, bishop of St. Asaph, February 24, 1786, he says:

You seem desirous of knowing what progress we are making here in improving our governments. We are, I think, in the right road of improvement, for we are making experiments. I do not oppose all that seems wrong, for the multitude are more effectually set right by experience than kept from going wrong by reasoning with them, and I think we are daily more and more enlightened, so that I have no doubt of our obtaining in a few years as much public felicity as good government is capable of affording.

Your newspapers are filled with fictitious accounts of anarchy, confusion, distresses, and miseries we are supposed to be involved in as consequences of the Revolution, and the few remaining friends of the old government among us take pains to magnify every little inconvenience a change in the course of commerce may have occasioned.

<sup>a</sup> In his last speech in the convention of 1787 he said: "I think a general government necessary for us, and there is no form of government but what may be a blessing to the people if well administered."

<sup>b</sup> See the address of the assembly, Bigelow, Vol. IX, 248.

His calm remark, at a time when the Confederation was greatly in danger from such commotions as Shays' rebellion, that "we are making experiments," recalls Jefferson's opinion of that insurrection:

Commotions offer nothing threatening; they are a proof that the people have liberty enough, and I could not wish them less than they have. If the happiness of the mass of the people can be secured by the occasional expense of a little temper now and then, or even of a little blood, it will be a precious purchase.

To punish these errors too severely would be to suppress the only safeguard of the public liberty.

A little rebellion now and then is a good thing. \* \* \* An observation of this truth should render honest Republican governors so mild in their punishment of rebellions as not to discourage them too much. It is a medicine necessary for the sound health of government.

Thus I calculate an insurrection in one of the thirteen States in the course of eleven years \* \* \* amounts to one in any particular State in one hundred and forty-seven years—say a century and a half. This would not be near as many as have happened in any prior government that has ever existed, so that we shall have the difference between a light and a heavy government as clear gain.

Can history produce a history of a rebellion so honorably conducted? \* \* \* God forbid that we should ever be twenty years without such a rebellion. What signifies a few lives lost in a century or two? The tree of liberty must be refreshed from time to time with the blood of patriots and tyrants. It is its natural manure.

Franklin wrote to Dr. Shipley before Shays' rebellion; Jefferson wrote after it. The different view which each takes of that most threatening uprising illustrates quite perfectly the difference between the two men in their opinions of government. It is in this letter to Dr. Shipley that Franklin, in acknowledging the receipt of Paley's *Moral Philosophy*, says:

The new book you gave me \* \* \* I think generally well written and likely to do good, though the reading time of most people is of late so taken up with newspapers and little periodical pamphlets that few nowadays venture to attempt reading a quarto volume. I have admired to see that, in the last century, a folio, Burton on Melancholy, went through six editions in about forty years. We have, I believe, more readers now, but not of such large books.<sup>a</sup>

He anticipated the days of the modern newspaper and of little books, compendious, comprehensive, and entertaining. It will be remembered that he advocated giving "little books, with gilt edges and red covers," as prizes to the children in his English school.

In the same letter he speaks of death, to which, says he, "I shall submit with the less regret, as, having seen during a long life a good deal of this world, I feel a growing curiosity to be acquainted with some other, and can cheerfully, with filial confidence, resign my spirit to the conduct of that great and good Parent of mankind who created it, and who has so graciously protected and prospered me from my birth to the present hour."

Having largely exhausted the resources of this world he was desirous of experimenting in another, and without doubt he desired no other immortality than the continuation of the life which he had lived—attaining moral perfection, observing phenomena and registering his conclusions concerning them, and contributing as far as possible to the general welfare of the inhabitants of another world.

While his mind was turned to the mysteries of life and death, he did not neglect congenial employment in some of the practical interests of this world. On the 8th of the following April, in a letter to his sister, he acknowledged the receipt

<sup>a</sup>For his letter at the time to the Duke de la Rochefoucauld, April 15, 1787, see Bigelow, Vol. IX, 363.

of a box of soap, "the substance of which appears to be very good, but its consistence had probably been affected by the frost, for unless very tenderly and cautiously handled the cakes would crumble into little pieces between one's fingers. However, having an opportunity of sending some to my friends in France, who much admired what I had of you formerly, I with much difficulty took out twenty-two cakes which I wrapped separately in spongy paper, hoping that as they dried they might consolidate and the infinite number of little cracks that appeared in them be closed and the parts again united; and so I sent them away in a small box."

The attention which he gave to his sister's imperfect soap suggests that he was still the son of the tallow chandler and kindly regardful of the practical concerns of his beloved sister, for he concludes his letter, saying: "Draw upon me for the expense of the soap and your bill shall be paid on sight."

It was in the year 1786 that the people who had crossed over the mountains and settled in the country now called Tennessee gave to their new commonwealth the name Franklin. The name of the new country continued only for a short time, but it is an evidence of the affection in which Franklin was held by his countrymen.<sup>a</sup>

In this year the celebrated letter to Thomas Paine was written in which Franklin advised him about publishing his *Age of Reason*. Its arguments were subtle and might prevail with some readers, but would they succeed in changing the general sentiments of mankind? Would not the consequence of printing the piece be that a great deal of odium would be drawn upon its author and no one would be benefited? "He that spits against the wind spits in his own face."<sup>b</sup>

He was elected in 1787 a delegate to the convention which revised the old Articles of Confederation and proposed a better Constitution; but though he was to be one of the immortals in that business he doubted whether his malady would permit him giving it his constant attention. There is evidence that he was present at most of the sessions. Ill health prevented him frequently from walking, but he struggled against the disease and took as much exercise as possible. He was afterwards able to say in a letter to his sister, September 20, 1787:

The convention finished the 17th instant. I attended the business of it five hours in every day from the beginning, which is something more than four months. You may judge from thence that my health continues; some tell me I look better, and they suppose the daily exercise of going and returning from the statehouse has done me good.

This reference to his health and of his going and returning from the statehouse is a bit of important evidence as to the place where the Constitution of the United States was made.<sup>c</sup>

<sup>a</sup> See A Declaration of Rights; also, The Constitution or Form of Government Agreed to and Resolved Upon by the Representatives of the Freemen of the State of Frankland, Elected and Chosen for that Particular Purpose, in Convention Assembled, at Greeneville, the 14th of November, 1785. Philadelphia: Printed by Francis Bailey, at Yoricks Head. MDCCLXXXVI. Reprinted, with an introduction and historical notes, in the American Historical Magazine, January, 1896. Nashville, Tenn.: Printed by the University Press, 208 N. College street. See also a short account of the State of Franklin (or Frankland) in my Constitutional History of the American People, 1776-1850, Vol. I, pp. 135-136.

By the census of 1890 (just a century after the death of Franklin) there were in the United States 24 Franklin counties, 33 towns called Franklin, 1 Franklin City, 1 Franklin Corners, 1 Franklin Crossroads, 1 Franklindale, 1 Franklin Depot, 2 Franklin Falls, 2 Franklin Furnaces, 1 Franklin Forks, 1 Franklin Grove, 1 Franklin Iron Works, 2 Franklin Mills, 1 Franklin's Mills, 2 Franklin parks, 1 Franklin Square, 2 Franklin stations, 4 Franklintons, 1 Franklinton, 6 Franklinvilles, and 1 Frankland. The number of Franklin streets and avenues is innumerable.

<sup>b</sup> See letter of June 15, 1786, Bigelow IX, p. 318; also April 9, 1787, idem, p. 361. This letter appears to be one of the many which Franklin wrote on various subjects, but never sent.

<sup>c</sup> The old statehouse on Chestnut street, below Sixth, Philadelphia.

His work in the convention was beneficent and his correspondence during the time interesting. To Jefferson he wrote, April 19, 1787:

Our Federal Constitution is generally thought defective, and a convention, first proposed by Virginia and since recommended by Congress, is to assemble here next month to revise it and propose amendments. The delegates generally appointed, as far as I have heard of them, are men of character for prudence and ability, so that I hope good from their meeting. Indeed, if it does not do good it must do harm, as it will show that we have not wisdom enough among us to govern ourselves, and will strengthen the opinion of some political writers that popular governments can not long support themselves.

His services in the convention were not inferior to those of any of his associates. The character of his suggestions might have been anticipated from the habits and experience of his life. He sought to harmonize the many differences between the States, and he applied to the problem the principles he had worked out in his diplomatic experience. He believed that each State should have equal suffrage, which should be in proportion to the sum it actually contributed to the National Treasury. His predominant idea was equality of representation; his chief object was to promote the general welfare by the maintenance of such equality; and it was ultimately secured by the dual system of representation in the Senate and the House of Representatives. "The forming of it [the Constitution] so as to accommodate all the different interests and views," said he, "was a difficult task; and, perhaps, after all, it may not be received with the same unanimity in the different States that the convention has given an example of in delivering it out for their consideration. We have done our best and it must take its chances." This sentiment illustrates his opinion that the Union is permanent as long as it has the power of readjusting itself to new conditions. This is the national idea, and Franklin was the chief northern exponent of it in the eighteenth century.

His influence in the convention won the general signature to the Constitution at last, and particularly his speech, which was read by Wilson just before the signing. We know that the convention was frequently inharmonious, and that there were serious threats of permanent interruption of its proceedings. It was in recognition of the danger of this calamity that Franklin made his celebrated motion "that henceforth prayers, imploring the assistance of Heaven and its blessing on our deliberations, be held in this assembly every morning before proceeding to business; and that one or more of the clergy of Philadelphia be requested to officiate."

However, the convention, except three or four persons, thought prayer unnecessary. It was in offering this motion that Franklin said:

In this situation of this assembly, groping, as it were, in the dark to find political truth, and scarce able to distinguish it when presented to us, how has it happened, sir, that we have not hitherto once thought of humbly applying to the Father of Lights to illuminate our understandings? In the beginning of the contest with Britain, when we were sensible of danger, we had daily prayers in this room for the Divine protection. Our prayers, sir, were heard, and they were graciously answered. All of us who were engaged in the struggle must have observed frequent instances of a superintending Providence in our favor. To that kind Providence we owe this happy opportunity of consulting in peace on the means of establishing our future national felicity. And have we now forgotten that powerful Friend, or do we imagine we no longer need its assistance? I have lived, sir, a long time, and the longer I live the more convincing proofs I see of this truth, *that God governs in the affairs of men*. And, if a sparrow can not fall to the ground without His notice, is it probable that an empire can rise without His aid? We have been assured, sir, in the sacred writings, that "except the Lord build the house, they labor in vain that build it." I firmly believe this, and I also believe that, without His concurring aid, we shall succeed in this political building no better than the builders of Babel; we shall be divided by our little, partial, local interests, our projects will be confounded, and we ourselves shall become a reproach

"God governs in the affairs of men."

and a byword down to future ages. And, what is worse, mankind may hereafter, from this unfortunate instance, despair of establishing government by human wisdom, and leave it to chance, war, and conquest.

His comments, in letters to friends, on the adoption of the Constitution, emphasize many of his opinions already known to us. To M. Le Veillard he wrote, February 17, 1788:

"We are a nation of politicians." I sent you with my last a copy of the new Constitution proposed for the United States by the late general convention. I sent one also to our excellent friend the Duke de la Rochefoucauld. I attended the business of the convention faithfully for four months. Inclosed you have the last speech I made in it. Six States have already adopted the Constitution, and there is now little doubt of its being accepted by a sufficient number to carry it into execution, if not immediately by the whole. It has, however, met with great opposition in some States, for we are at present a nation of politicians. And, though there is a general dread of giving too much power to our governors, I think we are more in danger from too little obedience in the governed.

We shall, as you suppose, have imposts on trade and custom-houses, not because other nations have them, but because we can not at present do without them. We want to discharge our public debt occasioned by the late war. Direct taxes are not so easily levied on the scantily settled inhabitants of our wide-extended country; and what is paid in the price of merchandise is felt less by the consumer, and less the cause of complaint. When we are out of debt we may leave our trade free, for our ordinary charges of government will not be great.

To M. Dupont de Nemours, on the 9th of June, he wrote, characteristically: "But we must not expect that a new government may be formed, as a game of chess may be played by a skillful hand, without a fault;" and he proceeded to illustrate his favorite idea that experience would determine the true course of the new government.

As he aged he became somewhat optimistical, an unusual thing with old persons, and perhaps he gave the fullest expression to his optimism in another letter to M. Le Veillard, June 8, 1788: "Thank God, the world is growing wiser and wiser, and as by degrees men are convinced of the folly of wars for religion, for dominion, or for commerce they will be happier and happier."

Though past 80 years of age, he continued to take an interest in all the affairs of mankind, and the writings of his closing years manifest no decay of mental power. Some of his most perfect papers in style and grasp of subject were written in the last two years of his life. He saw improvement and encouragement everywhere. He declares in his pamphlet on the Internal State of America, 1784:

It is true that in some of the States there are parties and discords; but let us look back and ask if we were ever without them. Such will exist wherever there is liberty, and perhaps they help to preserve it. By the collision of different sentiments sparks of truth are struck out and political light is obtained. The different factions which at present divide us aim all at the public good; the differences are only about the various modes of promoting it. \* \* \* Parties are therefore the common lot of humanity, and ours are by no means more mischievous or less beneficial than those of other countries, nations, and ages enjoying in the same degree the great blessing of political liberty.

This was written when the bitterness of party feeling was as intense as it has ever been in our history.

Whoever has traveled [he also remarks] through the various parts of Europe and observed how small is the proportion of people in affluence or easy circumstances there, compared with those in poverty and misery; the few rich and haughty landlords, the multitude of poor, abject, rack-rented, tithe-paying tenants, and half-paid and half-starved ragged laborers; and views here the happy mediocrity that so generally prevails throughout these States, where the cultivator works for himself and supports his family in decent plenty, will, methinks, see abundant reason to bless Divine Providence for the evident and great difference in our favor

and be convinced that no nation known to us enjoys a greater share of human felicity.

This optimistic view of America is characteristic of the man, and probably expresses the opinion which the American people now have of their country.

In his paper on the Prospect for Emigrants to America he says:

His advice to immigrants.

No rewards are given to encourage new settlers to come among us, whatever degree of property they may bring with them, nor any exemptions from common duties. Our country offers to strangers nothing but a good climate, fertile soil, wholesome air, free governments, wise laws, liberty, a good people to live among, and a hearty welcome. Those Europeans who have these or greater advantages at home would do well to stay there.

This paragraph might be epitomized in the saying that a man's country is where he is best off, a saying to which Franklin would doubtless give his approval.

He had long been in favor of the abolition of slavery, and around his closing years gathered a halo of the light which shines from the writings of men on behalf of the slave. His

Letter to Washington on slavery.

plan for the improvement of the African race was outlined in a letter to Washington somewhat in the form of a report.

First. A committee of inspection should superintend the morals, general conduct, and ordinary situation of free negroes, and furnish them advice and instruction, protection from wrongs, and other friendly offices.

Second. A committee of guardians should place out children and young people with suitable persons, that they might during a moderate term of apprenticeship or servitude learn some trade or other business for subsistence. In forming contracts on these occasions the committee should secure to the society, as far as practicable, the right of guardianship over persons so bound.

Third. A committee of education should superintend the school instruction of the children of the free blacks. They might either influence them to attend regularly the schools already established or form others with this view. They should in other cases provide that the pupils might receive such learning as is necessary for their future situation in life and especially a deep impression of the most important and generally acknowledged moral and religious principles.

Fourth. A committee of employ should endeavor to procure constant employment for those free negroes who were to work, as the want of this would occasion poverty, idleness, and many vicious habits. And he incorporated in this part of his plan the same notions which he had already expressed in his plan for the management of the orphan schoolhouses, that the committee, in providing employment for those qualified to take it, should prevail upon the apprentices to bind themselves for such a term of years as might compensate their masters for the expense and trouble of their instruction and maintenance. Useful and simple manufactures, such as require but little skill, should be entered upon as a substantial means of assisting those who are qualified to commence business for themselves. The expense incident to the prosecution of this plan was to be defrayed by a fund formed by donations or subscriptions for the particular purpose.

Perhaps no more interesting letter is found in the correspondence of this part of his life than his communication to

Franklin and Noah Webster.

Noah Webster, December 26, 1789, acknowledging a copy of Webster's Dissertations on the English Language. Franklin pronounced it "an excellent work," one that would be greatly useful "in turning the thoughts of our countrymen to correct writing." After commenting upon some new words that had come into the language since 1723, he continues:

The Latin language, long the vehicle used in distributing knowledge among the different nations of Europe, is daily more and more neglected; and one of the

modern tongues, namely, the French, seems in point of universality to have supplied its place. It is spoken in all the courts of Europe, and most of the literati, those even who do not speak it, have acquired knowledge enough of it to enable them easily to read the books that are written in it. This gives a considerable advantage to that nation; it enables its authors to inculcate and spread throughout other nations such sentiments and opinions on important points as are most conducive to its interests, or which may contribute to its reputation by promoting the common interests of mankind. It is perhaps owing to its being written in French that Voltaire's treatise on Toleration has had so sudden and so great an effect on the bigotry of Europe as almost entirely to disarm it. The general use of the French language has likewise a very advantageous effect on the profits of the bookselling branch of commerce, it being well known that the more copies can be sold that are struck off from one composition of types, the profits increase in a much greater proportion than they do in making a great number of pieces in any other kind of manufacture. And at present there is no capital town in Europe without a French bookseller's shop corresponding with Paris.

His prophecy concerning the English language.

But Franklin not only discerned the universality of the French tongue. He anticipated the growing universality of the English:

Our English bids fair to obtain the second place. The great body of excellent printed sermons in our language, and the freedom of our writings on political subjects, have induced a number of divines of different sects and nations, as well as gentlemen concerned in public affairs, to study it; so far at least as to read it. And if we were to endeavor the facilitating its progress, the study of our tongue might become much more general. Those who have employed some parts of their time in learning a new language have frequently observed that, while their acquaintance with it was imperfect, difficulties small in themselves operated as great ones in obstructing their progress. A book, for example, ill printed, or a pronunciation in speaking not well articulated, would render a sentence unintelligible, which from a clear print or a distinct speaker would have been immediately comprehended. If, therefore, we would have the benefit of seeing our language more generally known among mankind, we should endeavor to remove all the difficulties, however small, that discourage the learning it.

He concluded his letter to Webster by remarking that the spelling book which Webster had sent him was miserably printed on wretched paper. It is interesting to know that this spelling book, the most famous ever made and which in our day is used annually, it is said, to the number of more than a million copies, was approved by Franklin. His appeal for the English language in his letter to Webster was his last word on education. He ended as he began, encouraging the study of his native language and its literature. The empire of that language and that literature which he foresaw is realized in our day.

Educational views of Franklin, Adams, and Jefferson compared.

His ideas of education differed from those of his contemporaries. In order to show by comparison and contrast the educational notions which lie at the bottom of his philosophy, his ideas may be compared with those of John Adams and Thomas Jefferson. It may be premised that Adams's ideas of education are typical of New England thought on the subject, and by comparing them with Franklin's it will be seen how the surroundings of Franklin in Pennsylvania modified his early New England notions. This difference, once understood, aids perhaps in explaining some of the variations between the plans of education prevalent in New England and the middle colonies.

Franklin was a self-taught man; John Adams graduated a bachelor of arts at Harvard College in 1755, and soon after became the teacher of the grammar school in the town of Worcester. As was the case frequently with New England schoolmasters, teaching with Adams was only an expedient to supply, for the time being, the wants of life and to afford sufficient leisure to read law.

Adams was closely associated with Franklin in public life, both being members of important committees in the old Congress, the most famous of which drafted

the Declaration of Independence. Both had the independence of the colonies at heart while yet that independence seemed a great way off, and both served their country in diplomatic relations in Europe. They were much unlike in character, Franklin being easy, generous, liberal in his views, full of tact, wise in his observations, and preeminently happy in his relations with men; John Adams was upright and active, but suspicious, puritanical, and abrupt, ever viewing public affairs as a lawyer considers the case in hand and ever filled with an enormous capacity for business. We have already seen how the various activities in which Franklin was engaged through life determined his educational notions. In a similar manner John Adams's activities, which were chiefly legal and political, gave character to his educational ideas. Franklin was ever suggesting education as a means for cultivating the applied arts, for improving agriculture, for extending the conquests of science, and for promoting the general welfare.

It must have been noticed in this outline of his ideas that he gave very little attention, in his Plan of Education, to political studies, though he mentions them and urges the study of the principles of government, history, and politics. But he founds his scheme of education not upon a political but a scientific and industrial basis, for he was a man active in industrial affairs. He was little given to speculation and apt to view political events as mere changes on the sea of public opinion. Adams, on the other hand, was a born politician. The oldest letter of John Adams, written while yet a school-teacher in Worcester, October 12, 1755, is a political essay, in which he says that his friends should not be surprised that he was turned politician; the whole town is immersed in politics, the interests of nations and the *dura* of war made the subject of every conversation. "I sit and hear, and after having been led through a maze of sage observations I sometimes retire and by laying things together form some reflections pleasing to myself."<sup>a</sup>

He was always "immersed in politics," and politics was the basis of his educational ideas. These first appear in his treatise on government:

Laws for the liberal education of youth, especially of the lower classes of people, are so extremely wise and useful, that, to a humane and generous mind, no expense for this purpose would be thought extravagant.

He is the type of those men who would prescribe the means and ends of the state and "by good laws regulate all the affairs of mankind." Nowhere does Franklin hint at a "law which should provide for the liberal education

Adams the father of the public school.

of youth;" he never carried his scheme of education into government. John Adams, on the contrary, would embody a provision for education in the fundamentals of government, and this he did in the constitution of Massachusetts of 1780, of which instrument he was the chief author:<sup>b</sup>

Wisdom and knowledge, as well as virtue, diffused generally among the body of the people, being necessary for the preservation of their rights and liberties, and as these depend on spreading the opportunities and advantages of education in the various parts of the country and among the different orders of the people, it shall be the duty of legislators and magistrates, in all future periods of this Commonwealth, to cherish the interests of literature and the sciences and all seminaries of them, especially the University at Cambridge, public schools and grammar schools in the towns; to encourage private societies and public institutions, rewards and immunities for the promotion of agriculture, arts, sciences, commerce, trades, manufactures, and a natural history of the country; to countenance and inculcate the principles of humanity and general benevolence, public and private charity, industry and frugality, honesty and punctuality in their dealings, sincerity, good humor, and all social affections and generous sentiments among the people.

<sup>a</sup> Life and Works of John Adams, Vol. I, page 24.

<sup>b</sup> Section II. The Encouragement of Literature, etc.

His grandson, Charles Francis Adams, gives us some information of the origin of this celebrated clause:

This feature of the constitution of Massachusetts is peculiar, and in one sense original with Mr. Adams. The recognition of the obligation of a State to promote a higher and more extended policy than is embraced in the protection of the temporal interests and political rights of the individual, however understood among enlightened minds, had not at that time been formally made a part of the organic law. Those clauses, since inserted in other State constitutions, which, with more or less fullness, acknowledge the same principle are all manifestly taken from this source. The following history of the origin of it is taken from an account given by the author in 1809:

"In travelling from Boston to Philadelphia in 1774, '75, '76, and '77, I had several times amused myself, at Norwalk in Connecticut, with the very curious collection of birds and insects of American production made by Mr. Arnold, a collection which he afterwards sold to Governor Tryon, who sold it to Sir Ashton Lever, in whose apartments in London I afterwards viewed it again. This collection was so singular a thing that it made a deep impression upon me, and I could not but consider it a reproach to my country that so little was known, even to herself, of her natural history.

"When I was in Europe in the years 1778 and 1779 in the commission to the King of France, with Dr. Franklin and Mr. Arthur Lee, I had opportunities to see the King's collection and many others, which increased my wishes that nature might be examined and studied in my own country, as it was in others.

"In France, among the academicians and other men of science and letters, I was frequently entertained with inquiries concerning the Philosophical Society of Philadelphia, and with eulogiums on the wisdom of that institution and encomiums on some publications in their Transactions. These conversations suggested to me the idea of such an establishment at Boston, where I knew there was as much love for science, and as many gentlemen who were capable of pursuing it, as in any other city of its size.

"In 1779 I returned to Boston in the French frigate *La Sensible* with the Chevalier de la Luzerne and M. Marbois. The corporation of Harvard College gave a public dinner in honor of the French ambassador and his suite and did me the honor of an invitation to dine with them. At table, in the philosophy chamber, I chanced to sit next to Dr. Cooper. I entertained him during the whole of the time we were together with an account of Arnold's collection, the collections I had seen in Europe, the compliments I had heard in France upon the Philosophical Society at Philadelphia, and concluded with proposing that the future legislation of Massachusetts should institute an academy of arts and sciences.

"The Doctor at first hesitated, thought it would be difficult to find members who would attend to it; but his principal objection was that it would injure Harvard College by setting up a rival to it that might draw the attention and affections of the public in some degree from it. To this I answered, first, that there were certainly men of learning enough that might compose a society sufficiently numerous; and secondly, that instead of being a rival to the university, it would be an honor and advantage to it; that the president and principal professors would no doubt be always members of it, and the meetings might be ordered, wholly or in part, at the college and in that room. The Doctor at length appeared better satisfied, and I entreated him to propagate the idea and the plan, as far and as soon as his discretion would justify. The Doctor accordingly did diffuse the project so judiciously and effectually that the first legislature under the new constitution adopted and established it by law.

"Afterwards, when attending the convention for forming the constitution, I mentioned the subject to several members, and when I was appointed by the subcommittee to make a draught of a project of a constitution to be laid before the convention, my mind and heart were so full of this subject that I inserted the chapter fifth, section second.

"I was somewhat apprehensive that criticism and objections would be made to the section, and particularly that the 'natural history,' and 'the good humor' would be stricken out; but the whole was received very kindly and passed the convention unanimously without amendment."

It is a singularity, perhaps worthy of note in connection with these injunctions, that the individuals who have since been elevated by the popular voice to the chief offices of the State, with a single exception, have not been noted among their fellow-citizens for any superior acquisitions of learning or intellectual culture.

A considerable number have not gone through the higher grades of education in Massachusetts at all.

Adams proposes a system of public education. John Adams has the fame of being the first American statesman to incorporate in a State constitution a provision for public education. There were no public schools in Pennsylvania in Franklin's day, and all his ideas of education related chiefly to private enterprise and individual effort. There had been schools in Massachusetts from the beginning of the colony, and the momentum of educational ideas accumulated during a century and a half carried into the first State constitution this celebrated provision for the encouragement of learning. It will be noticed that Adams's plan provided for "the promotion of agriculture, arts, sciences, commerce, trades, manufactures, and a natural history of the country," the original suggestion of which is explained by his grandson.

It is a characteristic New England idea to make education a matter of law. Class distinctions in New England were marked in Franklin's day. The children of the tallow chandler were not classed as fit companions for the children of clergymen and lawyers. This should be remembered in interpreting another passage in Adams's treatise on government, pertaining to education:

The education here intended is not merely that of the children of the rich and noble, but of every rank and class of people, down to the lowest and the poorest. It is not too much to say that schools for the education of all should be placed at convenient distances, and maintained at the public expense. The revenues of the State would be applied infinitely better, more charitably, wisely, usefully, and therefore politically, in this way, than even in maintaining the poor. This would be the best way of preventing the existence of the poor. If nations should ever be wise, instead of erecting thousands of useless offices, of engaging in unmeaning wars, they will make a fundamental maxim of this, that no human being shall grow up in ignorance. In proportion as this is done tyranny will disappear, kings and nobles will be made to feel their equitable equality with commoners, and commoners will see their interest and duty to respect the guardians of the laws; for guardians they must have as long as human nature endures. There is no room to doubt that the schools, academies, and universities, the stage, the press, the bar, the pulpit, and Parliament might all be improved to better purpose than they have been in any country for this great purpose.

Again, speaking of a pure democracy:

The greater number of every people are still ignorant, and, although their leaders might artfully persuade them to a thousand idle expenses, they would not be able to persuade them to this [i. e., to maintain schools and universities at the public expense]. Education, then, must be supported by private munificence; and this source, although sufficient to maintain a few schools and a university in a great nation, can never be sufficient to maintain schools in sufficient numbers to educate a whole people. Where a senate is preserved it is always a maxim with them to respect learning, and educate their own families; their example is followed by all others who are in any way in easy circumstances. In a government of three branches commoners as well as nobles are under the necessity of educating their children, because they hope to be called to public service, where it is necessary. In all the mixed governments of antiquity education was necessary, and where the people had a share it was the most generally practiced, but in a simple government it never was general. In Sparta it was far from being general; it was confined to youth of family; so it was under the aristocracy in Rome. And although we have no examples of simple democracy to recur to, we need only consider that the majority must be ignorant and poor, and recollect the murmurs and opposition made by numbers of the lowest classes, who are often joined for sinister purposes by some men of consequence, to be convinced that a general public education never can long exist in a simple democracy; the stinginess, the envy, and malignity of the base and ignorant would be flattered by the artful and designing, and the education of every family left to its own expense, that the rich only might have their children educated.

Self-education vs. public education. Franklin would never have mentioned education in such a connection; he did not view the State as merely a political concern. Frequently he had occasion to remark on the different

condition of the rich and poor, and he was ever projecting schemes by which the poor might become rich; he would set everybody on the way to wealth. Industry, frugality, and self-education were the bases of Franklin's conception of the State. Adams, on the other hand, viewed the State wholly as a lawyer, conceived it as an affair of laws, which would adjust or attempt to adjust the rights of the rich and the poor, the weak and the strong, the good and the bad, and therefore, placing law as of chief importance in the State, he would regulate education by law. Nowhere does Adams intimate that the individual should educate himself.

When in Holland in 1780 Adams wrote a number of letters upon interesting phases of the American Revolution, and in reply to an inquiry "whether the common people in America are not inclined, when they are able to find sufficient means, to frustrate by force the good intentions of the politicians," he wrote:

The difference in that country [America] is not so great as it is in some others between the common people and the gentlemen; for noblemen we have none. There is no country where the common people—I mean the tradesmen, the husbandmen, and the laboring people—have such advantages of education as in that [America], and it may be truly said that their education, their understanding, and their knowledge are as nearly equal as their birth, fortune, dignities, and titles.

This might be expected from one whom his enemies sometimes called "the well-born," and it was strictly in keeping with the general tone of New England thought at the time. Nowhere in Franklin's writings can be found such a statement as Adams's, that knowledge among Americans is "as nearly equal as their birth, fortune, dignities, and titles." The counter statement is made in the Autobiography respecting the beneficial effect of founding the Philadelphia Library.

In other words, Franklin was a democrat in his educational ideas; Adams a New England aristocrat of the radical type, who would direct and guard the people's interest, discriminate as to their "birth, fortune, dignities, and titles," and by the artifice of law attempt to equalize their condition, as far as possible.

The different effect on America of the ideas of these two men is apparent in our time. Franklin's plan of self-education, rising to the dignity of utilitarian philosophy, has profoundly influenced the American people and stimulated thousands to improve themselves and acquire by frugality and industry advantages not theirs by birth. Adams, prescribing public education by the law of the State, was among the founders of our public-school system, by which the State educates the youth at public expense. Adams's ideas of education have eliminated, largely and necessarily, from the body of youth receiving instruction at the expense of the State, that personal, ambitious interest in self-education which is characteristic of those who follow Franklin's plan. Our public schools are characterized by a mechanism which produces uniform training of an average quality, and transforms ignorant childhood into book-taught youth, often without stirring that sense of personal concern in the acquisition of knowledge of which Franklin was always fondly speaking.

If John Adams was instrumental in founding the public-school system of the United States, when he incorporated in the constitution of Massachusetts of 1780 that famous clause providing for the maintenance of public schools and higher institutions of learning at public expense, an idea which has largely influenced the entire North, and which may be traced in successive State constitutions that have been made from Massachusetts to Oregon; and if he was successful in incorporating education by law in the organization of the State, yet he failed, as all have failed who would resolve education into a conformity with the requirements

of a law, however wise in its ultimate purposes, in founding a system of education which can compete in true value with that system which, like Franklin's, transforms every individual into an ever improving, self-educating soul.

Doubtless it has occurred to the reader that of the Franklin Followers of Franklin. model are such men as Horace Greeley, Abraham Lincoln, Robert Fulton, and Thomas A. Edison, original and creating minds, self-taught, yet ranking among the determinative forces in America. It is the old story of the college-made and the self-made man; but we must admit that, as human nature is at present constituted, it is better for our country to have the advantage of results obtained by the application of John Adams's plan for conventional education, prescribing it in the fundamental law of the State rather than running the risk of securing an educated democracy by the application of Franklin's plan of self-education. The few will profit by Franklin's example, the many will be improved by the operation of the laws which John Adams advocated. In fine, Franklin's ideas apply to individuals, Adams's to the welfare of the masses.

John Adams wrote in 1785: "The whole people must take upon themselves the education of the whole people and must be willing to bear the expense of it. There should not be a district of 1 mile square without a school in it, not founded by a charitable individual, but maintained at the expense of the people themselves." Benjamin Rush had written to Adams his opinions that "the benefits of free schools should not be overlooked. Indeed, suffrage in my opinion should never be permitted to a man that could not write or read." <sup>a</sup>

To which Adams replied: "Free schools, and all schools, colleges, academies, and seminaries of learning, I can recommend from my heart, but I dare not say that the suffrage should never be permitted to a man who can not read and write. What would become of the Republic of France if the lives, fortunes, and character of the twenty-four millions and a half men who can neither read nor write should be at the absolute disposal of 500,000 who can read?" Rush's opinion of an educational qualification for voting has never prevailed in this country.

In the closing years of his life Adams was in close and delightful correspondence with Thomas Jefferson, at a time when Jefferson was engaged in establishing the University of Virginia. In a letter to Jefferson, written from Quincy, July 16, 1814, we obtain quite a glimpse of the character of Adams's education if not of his ideas on that subject:

I am very glad you have seriously read Plato, and still more rejoiced to find that your reflections upon him so perfectly harmonize with mine. Some thirty years ago I took upon me the severe task of going through all his works. With the help of two Latin translations and one English and one French translation and comparing some of the most remarkable passages with the Greek I labored through the tedious toil. My disappointment was very great, my astonishment was greater, and my disgust was shocking. Two things only did I learn from him—first, that Franklin's ideas of exempting husbandmen and mariners, etc., from the depredations of war were borrowed from him, and, second, that sneezing is a cure for the hiccough. Accordingly I have cured myself and all my friends of that provoking disorder for thirty years with a pinch of snuff.

Some parts of his dialogues are entertaining, like the writings of Rousseau; but his *Laws* and his *Republic*, from which I expected most, disappointed me most. I could scarcely exclude the suspicion that he intended the latter as a bitter satire upon all republican governments, as Xenophon undoubtedly designed by his essay on democracy to ridicule that species of republic. In a late letter to the learned and ingenious Mr. Taylor, of Hazelwood, I suggested to him the project of writing a novel, in which the hero should be sent on his travels through Plato's Republic, and all his adventures, with his observations on the principles and opinions, the arts and sciences, the manners, customs, and habits of the citizens should be recorded. Nothing can be conceived more destructive of human happiness, more infallibly contrived to transform men and women into brutes, yahoos, or

<sup>a</sup> Works, Vol. IX, p. 540. Letter to John Jebb, September 10, 1785.

demons than a community of wives and property. Yet, in what are the writings of Rousseau and Helvetius wiser than those of Plato? "The man who first fenced a tobacco yard, and said, 'This is mine,' ought instantly to have been put to death," says Rousseau. "The man who first pronounced the barbarous word 'Dieu' ought to have been immediately destroyed," says Diderot. In short, philosophers, ancient and modern, appear to me as mad as Hindoos, Mahometans, and Christians. No doubt they would all think me mad; and, for anything I know, this globe may be the bedlam, le Bicêtre, of the universe.

After all, as long as property exists, it will accumulate in individuals and families. As long as marriage exists, knowledge, property, and influence will accumulate in families. Your and our equal partition of intestate estates, instead of preventing, will, in time, augment the evil, if it is one. The French revolutionists saw this, and were so far consistent. When they burned pedigrees and genealogical trees, they annihilated, as far as they could, marriages, knowing that marriage, among a thousand other things, was an infallible source of aristocracy. I repeat it, so sure as the idea and the existence of property is admitted and established in society, accumulations of it will be made—the snowball will grow as it rolls.

Cicero was educated in the groves of Academus, where the name and memory of Plato were idolized to such a degree that if he had wholly renounced the prejudices of his education his reputation would have been lessened if not injured and ruined. In his two volumes of Discourses on Government we may presume that he fully examined Plato's Laws and Republic as well as Aristotle's writings on government. But these have been carefully destroyed, not improbably with the general consent of philosophers, politicians, and priests. The loss is as much to be regretted as that of any production of antiquity.

Nothing seizes the attention of the staring animal so surely as paradox, riddle, mystery, invention, discovery, wonder, temerity.

Plato and his disciples from the fourth century Christians to Rousseau and Tom Paine have been fully sensible of this weakness in mankind, and have too successfully grounded upon it their pretensions to fame. I might, indeed, have mentioned Bolingbroke, Hume, Gibbon, Voltaire, Turgot, Helvetius, Diderot, Condorcet, Buffon, De la Lande, and fifty others, all a little cracked.

Be to their faults a little blind,  
To their virtues ever kind.

Education! oh, education! the greatest grief of my heart and the greatest affliction of my life! To my mortification I must confess that I have never closely thought or deliberately reflected upon the subject, which never occurs to me now without producing a deep sigh, a heavy groan, and sometimes tears. My cruel destiny separated me from my children almost continually from their birth to their manhood. I was compelled to leave them to the ordinary routine of reading, writing, and Latin school, academy, and college. John alone was much with me, and he but occasionally.

If I venture to give you my thoughts at all they must be very crude; I have turned over Locke, Milton, Condillac, Rousseau, and even Miss Edgeworth, as a bird flies through the air. The Preceptor I have thought a good book. Grammar, rhetoric, logic, ethics, mathematics can not be neglected. Classics, in spite of our friend Rush, I must think indispensable. Natural history, mechanics, and experimental philosophy, chemistry, etc., at least their rudiments, can not be forgotten. Geography, astronomy, and even history and chronology, though I am myself afflicted with a kind of pyrrhonism in the two latter, I presume can not be omitted. Theology I would leave to Ray, Durham, Nieuwentyt, and Paley rather than to Luther, Zinzendorf, Swedenborg, Wesley, or Whitefield, or Thomas Aquinas, or Wollébius. Metaphysics I would leave in the clouds with the materialists and spiritualists, with Leibnitz, Berkeley, Priestley, and Edwards, and, I might add, Hume and Reed. Or, if permitted to be read, it should be with romances and novels. What shall I say of music, drawing, fencing, dancing, and gymnastic exercises? What of languages, oriental or occidental? Of French, Italian, German, or Russian, of Sanscrit or of Chinese? The task you have prescribed to me of grouping these sciences or arts under professors, within the views of an enlightened economy, is far beyond my forces. Loose, indeed, and undigested must be all the hints I can note.

Might grammar, logic, and rhetoric be under one professor? Might mathematics, mechanics, natural philosophy be under another? Geography and astronomy under a third? Laws and government, history and chronology under a fourth? Classics might require a fifth. Condillac's course of study has excel-

lent parts. Among many systems of mathematics, English, French, and American, there is none preferable to Bezout's course. La Harpe's course of literature is very valuable.

The correspondence between Adams and Jefferson brings to light the training which these eminent men had received, and our acquaintance with their public services and their private life suggests to us comparisons between their views of education and enables us to understand how three men so efficiently equipped for their work in life as were Franklin, Adams, and Jefferson, contemporaries, colleagues, and associates in several of the most important public services of the century, advocated educational views in conformity with their own individual experience and education in life. Franklin was self-educated, and his plan of education implies that all others should do likewise. Adams, of ancient New England family, a born politician, a lawyer, a statesman, recognizing different classes in society, is college bred with interests somewhat discordant, and seeking to establish public education at public expense. Jefferson's educational views resemble Adams's rather than Franklin's, for Jefferson, like Adams, a college man, viewed the subject in its legal aspects, though he differed greatly from Adams in his personal interest in agriculture, in mechanics, in invention, and in architecture.

Jefferson's educational views may be gathered from his correspondence, and particularly from many letters written during the last twenty years of his life.

I have long entertained the hope [he writes] that this our native State would take up the subject of education and make an establishment there, with or without incorporation into that of William and Mary College, where every branch of science deemed useful at this day should be taught in its highest degree. With this view I have lost no occasion of making myself acquainted with the organizations of the best seminaries in other countries, and with the opinions of the most enlightened individuals on the subject of the sciences worthy of a place in such an institution. In order to prepare what I had promised our trustees I have lately revised these several plans with attention, and I am struck with the diversity of arrangement observable in them, no two being alike. Yet I have no doubt that these several arrangements have been the subject of mature reflections by wise and learned men, who, contemplating local circumstances, have adapted them to the section of society for which they have been framed. I am strengthened in this conclusion by an examination of each separately, and the conviction that no one of them, if adopted without change, would be suited to the circumstances and pursuits of our country. The example they have set to them is authority for us to select from their different institutions the materials which are good for us, and with them to erect a structure whose arrangement shall correspond with our own social condition, and shall admit of enlargement in proportion to the encouragement it may merit and receive.

Jefferson the eclectic.

After this sensible introduction, which contains a wholesome warning against mere imitation in educational establishments and a proper recognition of peculiar local conditions in every individual foundation, Jefferson proceeds to survey the general field of education and to mark out that particular portion to be occupied by the proposed institution in his immediate neighborhood. He considers the subject under three heads—elementary schools, general schools, and professional schools. Under the first head he observes that it is the duty of a government to see that every citizen is educated according to his condition and pursuits in life. He divides the mass of citizens into the laboring and the learned classes, including under the former agricultural labor and handicrafts and under the latter certain skilled labor and technical knowledge. Elementary schools will suffice for the laboring classes.

Jefferson notes the fact that a plan was once proposed to the legislature of Virginia to divide every county into hundreds or wards, five or six miles square, each ward to have its own schools for the elementary education of the children in reading, writing, arithmetic, and geography. He expresses the hope that this

Jefferson notes the fact that a plan was once proposed to the legislature of Virginia to divide every county into hundreds or wards, five or six miles square, each ward to have its own schools for the elementary education of the children in reading, writing, arithmetic, and geography. He expresses the hope that this

project, once ineffectually attempted, may be resumed "in a more promising form." Passing to the second head Jefferson remarks that pupils leaving the elementary schools will separate into two classes, for the pursuit of labor and science, respectively. Pupils destined for the latter will go to college, where higher education is afforded by general schools and is specialized in professional schools. The learned class he divides into two sections: First, those destined for professional life; and second, the wealthy, who "may aspire to share in conducting the affairs of the nation, or live with usefulness and respect in the private ranks of life." Both the learned and the wealthy will require the higher education, but the former will need to specialize and pass from the general to the professional schools.

Jefferson then attempts to classify the branches of useful science which ought to be taught in the general schools. He

Classification of studies. groups them under three departments: Language, mathematics, and philosophy. In the first department he arranges languages and history, ancient and modern; grammar, belles-lettres, rhetoric, and oratory, and a school for the deaf, dumb, and blind. "History," he says, "is here associated with languages, not as a kindred subject but on a principle of economy, because both may be attained by the same course of reading if books are selected with that view." This thought, originally advanced by Jefferson as the basis of elementary education, became in the person of George Long, the classical historian, one of the ideal corner stones of the University of Virginia. Under the head of mathematics Jefferson classified the following sciences: Pure mathematics, physico-mathematics, physics, chemistry, mineralogy, botany, zoology, anatomy, and the theory of medicine.

Under philosophy he grouped ideology, ethics, the law of nature and of nations, government, and political economy. By the term "ideology" Jefferson meant simply the science of the human understanding. He borrowed his novel term from a French writer, Count Destutt Tracy, member of the Senate and of the Institute of France, whose treatise on the Elements of Ideology was first published in France in the year 1801, and is reported by Jefferson to have been condemned by Napoleon as "the dark and metaphysical doctrine of ideology, which, diving into first causes, founds on this basis a legislation of the people."<sup>a</sup>

This work, which the present generation would probably condemn on other grounds, made a profound impression upon Jefferson, who wished to establish democracy upon a philosophical basis.

Jefferson was the first to include professional schools in a plan for an American university. To these schools he believed would come those students who proposed to make learning their profession, and who wished to pursue a particular science with more minuteness and detail than was possible in the college proper, which would give simply a liberal education. "In these professional schools each science is to be taught in the highest degree it has yet attained." Here Jefferson discovers the real university idea, and at the same time the idea of specialization for a definite purpose. "To these professional schools will come," he says, "the lawyer to the school of law; the ecclesiastic to that of theology and ecclesiastical history; the physician to those of the practice of medicine, materia medica, pharmacy, and surgery; the military man to that of military and naval architecture and projectiles; the agricultor to that of rural economy; the gentleman, the architect, the pleasure gardener, painter, and musician, to the school of fine arts."

Besides the university idea and the thought of these special schools, Jefferson, in his letter to Carr, clearly anticipated the modern idea of technical education.

<sup>a</sup> Jefferson's letter to Colonel Duane, April 4, 1813.

He proposed what he called a "school of technical philosophy," where certain of the higher branches should be taught in abridged form to meet practical wants." "To such a school," he said, "will come the mariner, carpenter, shipwright, pump maker, clock maker, mechanist, optician, metallurgist, founder, cutler, druggist, brewer, vintner, distiller, dyer, painter, bleacher, soap maker, tanner, powder maker, salt maker, glass maker to learn as much as shall be necessary to pursue their art understandingly of the sciences of geometry, mechanics, statics, hydrostatics, hydraulics, hydrodynamics, navigation, astronomy, geography, optics, pneumatics, acoustics, physics, chemistry, natural history, botany, mineralogy, and pharmacy."

In this school of technology Jefferson proposed to group the students in convenient classes for elementary and practical instruction by lectures to be given in the evening, so to afford an opportunity for labor in the daytime. Military exercises were to be required on certain days throughout the entire course for all grades of students. Thus the features of military schools, technological institutes, and modern agricultural colleges were associated with the higher education in a people's university as conceived by Thomas Jefferson.

Of course Jefferson did not expect to realize all at once this educational scheme as proposed to Peter Carr. He urged as a practical beginning the establishment of a general school or college with four professorships, grouping (1) language and history, belles-lettres, rhetoric, and oratory; (2) mathematics, physics, etc.; (3) chemistry and other natural sciences; (4) philosophy, which, in his view, included political science. He said these professorships "must be subdivided from time to time as our means increase until each professor shall have no more under his care than he can attend to with advantage to his pupils and ease to himself." With further increase of resources professional schools were to be added.

Such were the fundamental lines of thought which gave shape to the first project for a university of Virginia in Jefferson's own neighborhood. Like the preliminary drawings of a great artist, these bold outlines have a permanent interest to the student.<sup>a</sup>

After comparison of the educational views of Franklin, Jefferson, and John Adams, we conclude that the present public-school system of the United States, which is established by the constitutions and laws of the several States, is in conformity with the educational views of Adams. While it can not be affirmed that he was the sole originator of the system of American public schools, it may be said truly that he is the earliest eminent American statesman who incorporated a provision for such public education, not only in his writings on government, but in his political service, and particularly in that clause which he wrote in the constitution of Massachusetts in 1780, providing for a system of education at public expense.

Adams, at least, had the philosophy of education on his side, for he set forth his ideas on the universal principle of the general welfare, approaching the subject from a consideration of the universal character of education; while Franklin approached it from a consideration of the individual, and of the opportunities which are to be derived from education. Adams, therefore, identifying the interests of education and the interest of the masses, stands among those who founded our educational system; Franklin outlined a method adapted to the wants of individuals, but at the same time dependent upon them for its successful operation. He founded no system of education; he did not identify the operation of his educational plans with the needs and the growth of the State. Self-education may be said to be the natural method of education; this was Franklin's plan. Educa-

<sup>a</sup>H. B. Adams; Thomas Jefferson and the University of Virginia, pp. 62-64.

tion at the expense of the State, according to law, so earnestly advocated by John Adams, may be called the conventional system, practicable and advantageous in a country like ours. Jefferson took a somewhat higher ground, recognizing that education must be directed by those technically trained to perform its duties. He studied and compared the educational institutions of Europe before he attempted to found the University of Virginia, and sought to incorporate in that university the best of all that he saw abroad that was adapted to the wants of America. He would found an institution in which the young might pursue not only all general studies, but also an institution which would provide technical instruction for those who would pursue particular studies at great length. If John Adams is the father of the common school and Benjamin Franklin the model of the self-educated man, Thomas Jefferson is the promoter of the university idea in America.

Influence of their educational views.

The influence of the ideas that each of these men advocated is clearly discernible in the educational history of America.

We have the public-school system—that is, the education of the masses by the masses, John Adams's idea; we have the technical school and the university, Jefferson's idea; and we have the means of self-education, books, business, factories, libraries, learned societies, nature, and the human soul capable of making use of these opportunities, Franklin's idea.

The American Philosophical Society.

The American Philosophical Society dates from the 25th of May, 1743, when Franklin published his famous prospectus for its establishment. It was incorporated by act of the legislature of Pennsylvania March 15, 1780, as The American Philosophical Society held at Philadelphia for Promoting Useful Knowledge. The language of the act of incorporation describes its functions, "the cultivation of useful knowledge and the advancement of the liberal arts and sciences;" "the prosecution and advancement of all useful branches of knowledge" for the benefit of mankind. The history of this venerable society, the oldest of its kind in the world, is the history of modern science. Franklin was its first president, elected January 2, 1769, and serving until his death.<sup>a</sup>

Last meeting presided over by Franklin.

The American Philosophical Society has enrolled in its membership the most eminent men in all countries since its incorporation. The records of the proceedings of the society show a multitude of useful subjects which it has from time to time considered. The records of the last meeting at which Franklin presided and of the meeting that took notice of his death are as follows:

1789. Oct. 2. (Six present; Franklin presiding.)

The Royal Irish Academy sent their Transactions, Vol. I. Ordered, that the secretaries send in acknowledgment Transactions American Philosophical Society, Vols. I, II.

Thos. Pole, of London, sent through his brother, Ed. Pole, of Philadelphia, a

<sup>a</sup>He was succeeded by the eminent David Rittenhouse in 1791-1796; Thomas Jefferson, 1797-1815; Caspar Wistar, 1815-1818; Robert Patterson, 1819-1824; William Tilghman, 1825; Peter Stephenson Duponceau, 1828; Robert M. Patterson, 1845; Nathaniel Chapman, 1846; Robert N. Patterson, 1849; Franklin Bache, 1853; Alexander Dallas Bache, 1855; John Kay Kane, 1857; George B. Wood, 1859; Frederick Fraley, 1880.

Franklin Bache and Alexander Dallas Bache were great-grandsons of Benjamin Franklin. Franklin Bache was distinguished as a chemist, as professor of chemistry in the Jefferson Medical College, as one of the authors of the Dispensary of the United States, and of many contributions on cognate subjects.

Alexander Dallas Bache resembled his illustrious ancestor. He was a self-educated man, a graduate of West Point, professor of chemistry and natural philosophy in the University of Pennsylvania, an active member of the Franklin Institute, of which he was a zealous and successful promoter, and first president of Girard College. He laid the plans for the Philadelphia High School, and as its first principal organized it, but won his chief fame as the head of the Coast Survey of the United States. His mind, like Franklin's, was interested in all matters of public concern, and he rendered efficient services in a multitude of matters by which his name is intimately associated with many of the most useful enterprises of a private and public nature in the educational affairs of the country.

letter of thanks for election, and "a description and drawing of a remarkable tumor which lately occurred in his practice."

Coal, white vitriol, slate, brick, burnt slate, alum, niter, freestone, and Indian pottery late found in a bank near Washington were presented through Franklin by David Reddick, esq.

P. Young's essay on the Powers and Mechanisms of Nature was presented, through Franklin, by Samuel Mather, of London.

Specimens of the papyrus of Syracuse were presented by Franklin.

1790. April 23. Special meeting. (Nineteen present.)

To consider of some testimony of respect to the memory of the late illustrious president.

An eulogy voted, to "be prepared by one of their members, to be pronounced before this body as soon as may be convenient."

Dr. William Smith and Dr. Rittenhouse "were highest in votes" by ballot "and had each an equal number."

These gentlemen \* \* \* consenting that the said eulogium \* \* \* shall certainly be prepared, it is left to themselves to determine which of them shall deliver it.<sup>a</sup>

The correspondence of the closing years of Franklin's life abounds in references to religious matters and illustrates the interest that was taken in his religious views.

Franklin's creed.

A few days before his death, in reply to a request from his old friend Ezra Stiles, president of Yale College, asking him to give his portrait for the college library, he answered the inquiry as to his own religious opinions:

Here is my creed. I believe in one God, the Creator of the Universe. That He governs it by His providence. That He ought to be worshipped. That the most acceptable service we render to Him is doing good to His other children. That the soul of man is immortal, and will be treated with justice in another life respecting its conduct in this. These I take to be the fundamental points in all sound religion, and I regard them as you do in whatever sect I meet with them.

As to Jesus of Nazareth, my opinion of whom you particularly desire, I think His system of morals and His religion, as He left them to us, the best the world ever saw, or is like to see; but I apprehend it has received various corrupting changes, and I have, with most of the present Dissenters in England, some doubts as to His divinity; though it is a question I do not dogmatize upon, having never studied it, and think it needless to busy myself with it now, when I expect soon an opportunity of knowing the truth with less trouble. I see no harm, however, in its being believed, if that belief has the good consequence, as probably it has, of making His doctrines more respected and more observed; especially as I do not perceive that the Supreme takes it amiss by distinguishing the unbelievers in His government of the world with any peculiar marks of his displeasure.

I shall only add, respecting myself, that, having experienced the goodness of that Being in conducting me prosperously through a long life, I have no doubt of its continuance in the next, though without the smallest conceit of meriting such goodness. \* \* \*

P. S.—I confide that you will not expose me to criticism and censures by publishing any part of this communication to you. I have ever let others enjoy their religious sentiments, without reflecting on them for those that appeared to me unsupportable or even absurd. All sects here, and we have a great variety, have experienced my good will in assisting them with subscriptions for the building their new places of worship; and, as I have never opposed any of their doctrines, I hope to go out of the world in peace with them all.<sup>b</sup>

His death.

As death approached and Franklin's strength failed, his breathing became oppressed, and some one suggested a change of position, that he might breathe easier. Conscious of the change through which he was passing, he said: "A dying man can do nothing easy."

The news of his death was received with sorrow throughout the civilized world.<sup>b</sup> The city of his adoption gave him an honorable burial. Four days after

<sup>a</sup> The eulogy was pronounced by Dr. William Smith.

<sup>b</sup> He died April 17, 1790, at 11 p. m., aged 84 years 3 months and 11 days.

his death his body was laid at rest by the side of his beloved wife in the burial ground of Christ Church, on Arch street, near Fifth.<sup>a</sup>

## V.

## FOR THE SAKE OF THE WHOLE.

The individualism which characterizes Franklin's ideas of culture, and it was also at the basis of his political economy, is lacking in the dominant educational ideas of our time, because the concept of the State has changed since Franklin's day. When the people of the American colonies became the people of the United States, the basis on which the new form of organization was made to rest was the individual. For him the State existed; for him the more perfect Union was formed. To develop and protect his interests governors and legislatures were chosen, and to make his rights secure courts were established and judges appointed.

The cardinal doctrine of the Declaration of Independence is the equality of individuals. All the provisions of the American bills of rights, the most permanent parts of our written constitutions, define the rights and privileges of the individual. Nor was this enthronement of the individual limited to the civil organization of the eighteenth century only; with slight modification, the support of the idea perceptibly lessening, it continued until the middle of the nineteenth century. Not until the industrial revolution of 1860-1865, and the counter industrial revolution which followed, was there, I may say, a beginning in the definition of the rights, privileges, immunities, and functions of the State as in any degree an organism paramount in importance to the individual. As the domination of individualism at the close of the eighteenth century is better understood, we are the more amazed that the people of America were able to organize either Commonwealth or nation. Our amazement diminishes, however, when we reflect that the eighteenth century was a period in which greater attention was given and more importance assigned to the form of the government than to the concept of the State as an organism.

It was a period when the English-speaking people of America changed their form of government from monarchical to democratic. After long familiarity with the monarchical form in England, its people were accustomed, as were Englishmen in America, to associate particular functions with the King, the Lords, and the Commons. In theory and in practice the three estates of the

Sundry other Societies—together with a numerous and respectable body of Citizens.

realm were checks and balances upon one another, so that the aggregate effect of their joint operation was the conservation of all interests of the English people.

Democratic devices and substitutes. When the people of America initiated an independent government and made written constitutions they supplied the place of the crown and the peerage with democratic devices by which the three departments of government—executive, legislative, and judicial—should be made and functioned as checks and balances one on another. These devices are now seldom thought of, because long familiarity with their operation has generated mental habits, and indeed has imparted to these devices the functional value so long attributed to the three English estates. These devices are chiefly mechanical arrangements of the factors in the civil formula, different official terms and powers for the two Houses, a different term and a different power for the Executive, the latter consisting of a combination of administrative and legislative authority, as in the exercise of the veto, and still different terms and powers for the judiciary. Thus the longer term of the Senate counterbalances the short term of the House, and possibly its turmoil. The Executive term and the veto power check the possible aggression of the legislative, and the term and emoluments of the judiciary contribute not only to its independence, but also to preserve a check and balance upon the legislative and the Executive.

Changes in the estimate of their value. In practice these mere mechanics of government are of far less import than was imputed to them during the lifetime of Franklin. Democracy finds its safeguard in men rather than in political mechanics. The phrase "checks and balances" is seldom heard outside of the lecture room. In place of mere devices public opinion restrains and directs public servants. Government in America is government by public opinion. In the eighteenth century it was thought that democratic government could be insured by adopting administrative devices. Then there were no political parties in which the individual was swallowed up. Then individualism was paramount. Franklin's system of self-culture was therefore a phase of the evolution of national education. No one at the close of the nineteenth century is so conspicuous as a self-educated man as was Franklin at the close of the eighteenth. There are always eminent citizens who are largely self-educated, but they rise to eminence not as did Franklin, in many departments of human activity, but usually by reason of their great wealth, obtained by controlling vast industrial combinations. The most eminent self-educated man of the nineteenth century in America was Lincoln, yet it would be unfair to compare him with Franklin. Fulton, Greeley, Andrew Johnson, Roger Sherman, not to mention eminent living Americans, were self-educated, yet save that they were self-taught they can not justly be compared with Franklin. Nor with justice can he be compared with them. Each was an individual, a unit, a self-centered soul, capable of serving the race. Franklin is better known to the world to-day than all the college men of America during the eighteenth century. This fact in no way depreciates the many nor exalts the one.

But little do or can the best of us;  
That little is achieved through liberty.  
Who, then, dares hold, emancipated thus,  
His fellow shall continue bound? Not I,  
Who live, love, labor freely, nor discuss  
A brother's right to freedom. That is "Why."

Self-culture is self-enfranchisement.

It is the enfranchised man who exalts himself by exalting the race. Franklin is like Lincoln and the rest in evolving a cultured individuality. In him the distinctions of nature were preserved. Too often are they lost in education. He did not sacrifice the means to the end in education. Life was larger than any schoolroom he could have entered. Yet the chief obstacle in the way of popular government is likely to be

the individual. He believes that democracy exists for him; that he is the state; that the elector is tenant in common of the estate of sovereignty. Therefore he easily concludes that the less there is of government the more there is of liberty. Franklin's citizen is not so. Self-culture is self-control, and individual self-control is the peace and the prosperity of the state. Because Franklin is so individualistic, his concept of the state is elusive to many. "Where is the state?" say they, "if the aggregate be only of individuals?" "How can there be a common policy if the individual is the measure of the state?" Franklin would answer: "The enfranchised individual is the highest product of this world, because he is a product of which every man by self-culture can be an example. Even if the father fails to reach the high level of excellence, the son may build higher. Culture habits are hereditary; self-restraint tells in the blood." When the doctrine of the Declaration of Independence is fully applied, Franklin would say, every man is enfranchised; that is, when he is individually self-cultured. Not until a man can fully identify himself is he educated. For this reason education is an evolution, and as we commonly know it, we know it only in single, and often in isolated phases.

It is the man, the individual, that is the determining element in life. Jefferson's chief service to his countrymen was in teaching them that the foundation of government is in men, not in things. Franklin makes unselfishness the chief virtue, therefore his educational process is difficult. Judged wholly by utilitarian ends, unselfishness is the most desirable thing in the world. Unfortunately the prevailing concept of the state leads to other things which largely dominate life. The state has few rights that the individual feels bound to respect. The state, it is too often said, owes a man this or that, a living, a profession, an office, an opportunity, whereas in truth the individual owes these to the state. Franklin sees in the state the joint contribution of sane men. Others, though not all others, see in the state an opportunity for personal advantage.

Are Franklin's ideas of education antiquated and at present irrelevant? Has the system inaugurated by Adams—education by the state at public expense—produced the highest type of individuals and the perfect state? Do the professional schools, as suggested by Jefferson, train the chief thinkers in each generation? Is there any neglect of the individual in public school education to-day? Are boys and girls trained like an army or taught like citizens?

In Franklin's time the population of the United States was almost wholly rural. One person in thirty-three was to be found in a city in 1790, the year when Franklin died. To-day one person of every four of our population is living in a city. Not one thirty-third but one-fourth of our population is urban. In cities then the test of the values of various methods of education will be determined. Are the children in cities taught by groups and masses or individually? Are they habituated to self-culture and to thinking or is the process through which they are passed mechanical rather than a culture process? Are our cities a problem in government that is likely to test the virtue of the republican idea? In cities the greatest liberties are taken with the rights and privileges of citizens. Hardly a city in America owns its franchises. Most of these have been granted to astute individuals, with no reservation compensatory in degree to the city. The inhabitants of cities seem to care the least and know the least about their local government. In the largest cities and in the most ignorant wards devotion to merely partisan selfishness is more excessive than in the rural districts. Yet even in these districts the urban carelessness is gaining entrance. The mechanical methods of a too formal state system of education foster panarchic evils. So much allowance must be made for human nature, it may be said that a tendency should not be construed as a men-

acing evil. A recognized tendency signifies that some more perfect adjustment should be made.

Educational qualifications for the franchise. In the early years of public school agitation, about 1845, the advocates of State education imputed to it the virtues of a panacea for social and political ills. Education would establish a new order, a régime of intelligence. An educational qualification would insure the State against abuses. New Jersey was the first State to suggest an educational qualification for the electors; New York followed in 1846; it was discussed in Ohio, Massachusetts, and Pennsylvania, but failed to win sufficient support to incorporate it in either the constitutions or the laws. It was suggested freely in the reconstruction of the Southern States, but the suggestion came from those who feared negro domination. Not only did it fail to be included in Southern constitutions and laws, but the conclusion of the whole matter took typical form in a provision of the bill of rights of the constitution of Mississippi of 1868—that no educational qualification should ever be required for any person to become an elector; a provision reversed by a clause of the Mississippi constitution of 1890.

South Carolina in 1895 copied the Mississippi provision of five years before, requiring an elector to be able to read or to explain any provision of the constitution, and made the additional provision that after the 1st of January, 1898, he must be able both to read and to write any section of the constitution, or show that he owns and has paid taxes during the previous year on property within the State assessed at \$300 or more. Obviously the educational qualification is measured as an equivalent, politically, to the ownership of property. A property qualification has always been defended as a means of anchoring men to the State.

The qualifications of the elector, at any time in our history, signify how public opinion decides that the state shall be conserved. A man having a fixed residence; possessing real or personal property taxed within the State; able to read or to write or professing belief in a prescribed religious creed, is one who, by the theory of the nature of the State that has obtained from time to time, may be intrusted with the direction of public affairs. Franklin believed in manhood suffrage, but for reasons of expediency thought that only men possessing taxable property should vote.

There is an interesting history connected with the religious-test clause in the constitution of Pennsylvania of 1776, which was made by a convention of which Franklin was president. At the time when the convention was in session in Philadelphia, several eminent clergymen, among whom were Muhlenberg and Provost Smith, of the university, fearing that the State was to be handed over to infidels and atheists, communicated to Franklin their desire to call on him and present a petition, to be handed by him to the convention, requesting it to prescribe a religious qualification for electors and officeholders. Franklin, with characteristic urbanity, replied that he would call on them. Greatly pleased, they drew up a provision which he duly presented. It was a religious test to apply alike to the elector and the elected, but Franklin, who was no friend of religious qualifications for either voters or officials, succeeded in limiting the requirement to members of the assembly, and by eliminating the electors and all other civil officers and magistrates from the operation of the provision, considered that he had made it as harmless as it was possible to do and satisfy the party represented by Smith and Muhlenberg. In a letter to Dr. Priestley he expressed his comfortable sensations that the provision was to affect only the few men who would be chosen to the assembly.

Though the American Commonwealth was founded at a time when the individual was conceived to be at the center of the civil system, experience has taught

us that the conservation of the State rests with the individual, and we are beginning to learn that the safety of the individual depends upon the State. The unreasonableness of an educational qualification for the voter is thought to be established by merely quoting the familiar doctrines of the Declaration of Independence. That organic body, the State, depends upon other resources than taxes for its existence. The functions of the State were obscure in the eighteenth century, and they are now only beginning to be understood. Individualism strictly applied in the State would never establish public institutions other than those of a punitive nature. In this respect the States of the ancient world were individualistic; some of them provided public amusements; none established hospitals, laboratories, or schools for the unfortunate, or asylums, or reformatories. The modern concept of the State is based on the idea that society is organic and the State itself an organ of society.

It may be said that Franklin's plan for self-culture fails to accomplish all the ends that society must accomplish in order to be fully protected; that the State must take the initiative when the individual will not, and, for the safety of all, that the State must suppose that the individual will not. This idea is at the basis of all compulsory schemes of education. It is claimed that advantages of education, though commonly acknowledged, are often remote; indeed, so remote that the State must become the official trustee of childhood and do for the child what the parent or guardian may neglect or refuse to do. Adams prescribes this service of the State not for the child, but for the State itself. The State is best protected when its inhabitants possess a maximum amount of knowledge and virtue, of which an amount, prescribed by State experience, is required of each individual. Thus State education is for the State; self-culture is for the individual. The State profits frequently by the self-culture of individuals, but its administration of the public business is keyed not by the degree of culture in individuals, but by the average intelligence of all the inhabitants.

The chief difficulty in teaching. The chief difficulty encountered in teaching is the common incapacity of pupils to realize that their studies are at all related to themselves; that in any way they themselves are responsible for themselves; that self-culture is not a task prescribed, but a means and instrument of power. Nor is this incapacity limited to pupils in all grades of public and private schools; it is the difficulty, and sometimes the obstacle, in colleges and universities. Franklin occasionally confesses that he never learned to be orderly, and chiefly because he did not like to be orderly. His dislike of order and orderly habits narrowly escaped developing into laziness. In some men it would have proved a cause of ruin; in Franklin, fortunately, it was hedged in and limited in its effects by other habits and qualities. It seldom happens that an individual is averse to self-culture in some one direction. It is necessary for his welfare as a citizen of a State that he should be cultured in enough directions to make it safe that he be freely at large. Adams's idea is of greater value to society than Franklin's; Franklin's idea is of more value to the individual than Adams's. The two ideas fairly measure two concepts of the State—one that the individual is at the center of the civil system, the other that the State is an organism and the individual is only a part.

Clearly we have left the first idea far behind, and purely for economic reasons. It is not an idea which, strictly applied, with all the allowances that must be made for human nature, will promote the general welfare. The State will gain by men of the Franklin type; it can not perform its functions if it depends solely upon men of that type; it must therefore apply Adams's idea of education, and require of all its inhabitants what many would not do for themselves, and all not so much for the sake of the individual as for the State itself.

But some one may ask, "What education is best?" "Which is of more value,

Franklin's or Adams's idea?" It seems to me that we must first agree on our terms, and I know none so wise here as Plato.

Then let us not leave the meaning of education ambiguous or ill defined. At present when we speak in terms of praise or blame about the bringing up of each person we call one man educated and another uneducated, although the uneducated man may be sometimes very well educated for the calling of a retail trader, or of a captain of a ship, and the like. For we are not speaking of education in this sense of the word, but of that other education in virtue from youth upward, which makes a man eagerly pursue the ideal perfection of citizenship and teaches him how rightly to rule and how to obey. This is the only training which, upon our view, would be characterized as education; that other sort of training, which aims at the acquisition of wealth or bodily strength, or mere cleverness apart from intelligence and justice, is mean and illiberal, and is not worthy to be called education at all. But let us not quarrel with one another about the name, provided that the proposition which has just been granted hold good, to wit, that those who are rightly educated generally become good men. Neither must we cast a slight upon education, which is the first and fairest thing that the best of men can ever have, and which, though liable to take a wrong direction, is capable of reformation. And this work of reformation is the great business of every man while he lives.<sup>a</sup>

Education, then, is self-culture, self-control, the work of reformation, rightly to rule and rightly to obey. If the ideals of democracy be true (and by democracy must be included popular government in the republican form and monarchical government combined, as is that of England, with popular representation, because to whatsoever degree a government is representative it tends inevitably toward democracy), the education of which Plato speaks is attainable, to some degree, by all sane persons. Mere learning is not and can not be education. All that acquisition of facts to which so many hours of youth are given by force of our common system of public and, indeed, of private education contributes little to the education of the Platonic kind. Acquisition of facts may supplant training; it may utterly fail to teach a man "how rightly to rule and how to obey." The strength of Franklin's idea of education, self-culture, consists in its equivalence to the Platonic definition. The Greek and the American here meet on common ground.

State education must have the Platonic ideal in order to make the perfect state possible. The evolution of the race, of society as part, of the individual as part, is the evolution of the State. Artifice, devices, instruments, systems, these are often tyrants that usurp the rightful sovereign, ideas. The citizen leads the State, not the State the citizen.

The citizen *v.* the state. Society is an illusion to the young citizen. It lies before him in rigid repose, with certain names, men, and institutions rooted like oak trees to the center, round which all arrange themselves the best they can. But the old statesman knows that society is fluid; there are no such roots and centers, but any particle may suddenly become the center of the movement and compel the system to gyrate round it, as every man of a strong will, like Pisistratus or Cromwell, does for a time, and every man of truth, like Plato or Paul, does forever. \* \* \* To educate the wise man the state exists; and with the appearance of the wise man the state expires. The appearance of character makes the state unnecessary. The wise man is the state. \* \* \* They only who build on ideas build for eternity; \* \* \* the form of government which prevails is the expression of what cultivation exists in the population which permits it.<sup>b</sup>

Thus, after all, the state is only an idea. Although all compose it, its confines are known only to the few who can compass it in thought. The future of democracy depends upon many elements, conditions, and combinations. Whatever phase of it exists at any time, the state which functions that democracy will have

<sup>a</sup>The Laws; Jowett's translation, "Dialogues of Plato," Vol. IV, p. 165.

<sup>b</sup>Emerson, Essay on Politics.

a service which it alone can perform, the service of taking care of its own, of perpetuating itself. The self-cultured man, the man who is educated in the Platonic sense, lives, thinks, and moves, and if the state be moral, with little preference for the mere form of government. This independence, like character itself, distinguishes the individual. Plato or Franklin could be content to live under any form of government founded on justice and virtue. Socrates dealt a fatal blow to the state when he obeyed its law and drank the cup of hemlock.

The ideal in education. In our own country public education needs to concern itself chiefly with maintaining a high ideal. That ideal is the citizen who is capable of rightly ruling, if called to rule, and of rightly obeying, if called to obey. In such an ideal all can find satisfaction, comfort, and encouragement. Whether the boy be some young Franklin, devoted to self-culture, that "work of reformation" which is "the great business of every man while he lives," or whether he be that boy who finds himself in the public school and there is ever ill at ease and takes up the work of the day without interest or understanding; whether the one boy or the other, later in life, when a child but older grown he enters among the responsibilities of manhood, of the state, of society, the perfection of citizenship must still be held up to him as the ideal. Self-culture discloses this ideal, but the demands of social efficiency, realized more clearly now than in Franklin's time, make it necessary for the state to hold up this ideal also. To many the state can only seem an obscure mass of regulations, ordinances, and laws, offering rewards and punishments, but this conception of the state is his who desires chiefly "the acquisition of wealth or bodily strength, or mere cleverness apart from intelligence and justice." In a great measure, therefore, the influence of Franklin on America has been Platonic. The perfection of citizenship is the ideal which he would raise for the people of the Republic.

The eighteenth century idea of the State. According to the ideas of the eighteenth century the individual was the center of all interests; to promote his welfare was the chief function of education, economy, and government. For him existed the State and the nation. Franklin shows the influence of this dominant idea; indeed he could not escape it. It was formulated in the Commonwealth constitutions; in the National Constitution; in laws, ordinances, and social customs of his day. No one then conceived the State to be an organism.

The organic or modern idea. It was a compact or agreement among individuals, their creation. The idea which distinguishes the closing thought of the nineteenth century was scarcely born at the close of the eighteenth—that the individual is only a part of the living organism—the State. Social efficiency was practically impossible among a people who, for want of means of transportation, were strangers to one another. Ideas require good roads, and no people can be homogeneous that lacks either. Not until the people of the United States were made neighbors one of another by canals, railroads, telegraph, and telephone lines, and by the associations that these imply, was the idea of the organic nature of the State sufficiently plain to become formulated in constitution of government. "The rights of labor" provides one of the clauses of the declaration of rights of the State of Wyoming, admitted into the Union in 1890—"The rights of labor shall have just protection through laws calculated to secure the laborer proper rewards for his service, and to promote the industrial welfare of the State." And again: "Water being essential to industrial prosperity, of limited amount, and easy of diversion from its natural channels, its control must be in the State, which, in providing for its use, shall equally guard all the interests involved." Provisions of this kind are rare in American State constitutions, though far less rare than they will be during the twentieth century. They signify that it is now recognized that the State as well as the individual has rights, and indeed that, as against the individual, the State has rights

paramount. They imply that we recognize that the State is an organism possessing functions.

Similar provisions, in evidence of the recognition of this idea, may be found in the State constitutions since 1870, defining the obligations of the executive *v.* the legislative and the judiciary, and, twenty years later, those defining the functions obligatory upon administrative officers. Provisions of this kind—and they vary in the degree to which they imply or express the organic nature of the State—were unknown in Franklin's time.

Political economists now as then talk and write of labor, wages, population, manufactures, value, money, taxation, and trade, but the words and phrases, though in part the same, have unlike meanings. To the modern political economist they signify chiefly functions of society and of the state, not entitled to be exploited by individuals only. Political economy now is the science of human relations; in the time of Franklin it was chiefly an explanation of causes conducing to the wealth of nations and of individuals. Franklin was in no sense a systematic political economist. Though he has much to say, in the aggregate, of the relativity of men and of nations, he measures the whole as an aggregation of individuals rather than as an organism of which the individual is a functional part. Efficiency with him is individual efficiency. Individual economy will be national wealth because each is wealthy; an economist of to-day easily understands how the individuals in the state may have forms of wealth, and yet the state and the individuals be functionally poor. The state or the nation, to Franklin, is an effect, not a cause; a resultant, not a determining factor in life. His political economy is in consequence individualistic, not dynamic, systematic, or organic.

Yet we must not forget that the present conclusions in political economy will suffer, or rather gain, by change, and that the economists of to-day may not fare so well in the opinion of mankind as has Franklin. The economic conclusions of to-day came by way of Franklin, and, as in the case of our ideas of labor, of subsistence and population, and of a standard of living, we are greatly indebted to him. If he were living to-day he would illuminate political economy as he found it, and by investigation and experiment leave it at his death well advanced.

In the direction of government he was far ahead of most of his contemporaries. Indeed, I know of but one, James Wilson, who kept pace with him. He clearly saw and frequently declared that the test of government is administration; indeed that, in an important sense, administration is government. This notion was novel in his day. Both Franklin and Wilson advanced and elaborated it in the Federal Convention. But even there it fell meaningless to many. No conviction wrought out by many years of public life was clearer to Franklin, and he elaborated it in the last great speech of his life, the speech which, undoubtedly, gave us the National Constitution.

Because he believed that the Constitution was administrable, he supported it and urged his colleagues to support it. To him and to Wilson the Constitution was not, as so commonly represented by later writers on the subject, "a fetic," He knew that it contains no mysterious remedies for human folly. Much as Jefferson has been criticised for his lack of admiration of the Constitution, he stands with Franklin and Wilson, believing that the entire instrument is purely administrative. The wisdom of this belief we know, for, because the Constitution is administrable, it has not gone the way of the Articles of Confederation.

Franklin, like Plato, is a citizen of all time. In him we find the old and the new. It was prophetic when he said that he seemed to have projected himself into posterity. Explanations will never be lacking of the secret of Franklin's power. Was it in his self-culture? Was it in his humanity? Was it his love of

truth and his unselfishness? Was it the directness and sanity of his vision? Was it his friendly relations and sympathy with all sorts and conditions of men?

With all, at last, he stands in sane relations. His own life was a reformation, and he had the courage to disclose the process. Thus he is generic and typical. Not all that he did does he commend to others to do. Human nature is not to be taken too literally. He was a man, and that means—limitation. Yet, because Franklin was Franklin, the world will continue to unvail statues of him.

Franklin, Washington, and Lincoln are the three Americans whose faces are best known, and of these Franklin and Lincoln rank among the few great men of all time. Neither was free from the infirmities of genius. Each had calm confidence in the ultimate triumph of right over wrong, of wisdom over folly, of unselfishness over selfishness, and of the reign of justice among all peoples. Each cheered the world by a living faith in immortality, a faith that makes the great figures of the past cast a long light into the future.

If Franklin's ideas of education, economy, and government seem to some primitive, they are at least fundamental. Familiarity with them brings us to friends and good company. It is well for a youth to know well a former age and the great men of olden time. They minister consolation, saying—

Best of strangers, we also are poets, according to our ability, of the best and noblest tragedy; for our whole state is an imitation of the best and noblest life, which we affirm to be, indeed, the very truth of tragedy. You are poets and we are poets, your rivals and antagonists in the noblest of dramas, which true law, and that only, can carry out in act, as our hope is.

The ruler of the universe has ordered all things with a view to the preservation and perfection of the whole, and each part has an appointed state of action and passion; and the smallest action or passion of any part affecting the minutest fraction has a presiding minister. And one of these portions of the universe is thine own, stubborn man, which, however little, has the whole in view: and you do not seem to be aware that this and every other creation is for the sake of the whole, and in order that the life of the whole may be blessed, and that you are created for the sake of the whole, and not the whole for the sake of you.<sup>a</sup>

## APPENDIX I.

### PROPOSALS RELATING TO THE EDUCATION OF YOUTH IN PENNSYLVANIA.

#### ADVERTISEMENT TO THE READER.

It has long been regretted as a misfortune to the youth of this province that we have no academy in which they might receive the accomplishments of a regular education. The following paper of hints toward forming a plan for that purpose is so far approved by some public-spirited gentlemen, to whom it has been privately communicated, that they have directed a number of copies to be made by the press, and properly distributed, in order to obtain the sentiments and advice of men of learning, understanding, and experience in these matters; and have determined to use their interest and best endeavors to have the scheme, when completed, carried gradually into execution: in which they have reason to believe they shall have the hearty concurrence and assistance of many who are well-wishers to their country. Those who incline to favor the design with their advice, either as to the parts of learning to be taught, the order of study, the method of teaching, the economy of the school, or any other matter of importance to the success of the undertaking, are desired to communicate their sentiments as soon as may be, by letter, directed to B. Franklin, printer, in Philadelphia:

The good education of youth has been esteemed by wise men in all ages as the surest foundation of the happiness both of private families and of commonwealths. Almost all governments have therefore made it a principal object of their attention to establish and endow with proper revenues such seminaries of learning as might supply the succeeding age with men qualified to serve the public with honor to themselves and to their country.

Many of the first settlers of these provinces were men who had received a good education in Europe, and to their wisdom and good management we owe much of our present prosperity. But their hands were full and they could not do all

<sup>a</sup>Plato: Laws, Jowett's translation, §17, 903.

things. The present race are not thought to be generally of equal ability; for, though the American youth are allowed not to want capacity, yet the best capacities require cultivation; it being truly with them, as with the best ground, which, unless well tilled and sowed with profitable seed, produces only ranker weeds.

That we may obtain the advantages arising from an increase of knowledge, and prevent, as much as may be, the mischievous consequences that would attend a general ignorance among us, the following hints are offered toward forming a plan for the education of the youth of Pennsylvania, viz:

It is proposed.

That some persons of leisure and public spirit apply for a charter, by which they may be incorporated, with power to erect an academy for the education of youth, to govern the same, provide masters, make rules, receive donations, purchase lands, and to add to their number, from time to time, such other persons as they shall judge suitable.

That the members of the corporation make it their pleasure, and in some degree their business, to visit the academy often, encourage and countenance the youth, countenance and assist the masters, and by all means in their power advance the usefulness and reputation of the design: that they look on the students as in some sort their children, treat them with familiarity and affection, and when they have behaved well and gone through their studies, and are to enter the world, zealously unite and make all the interest that can be made to establish them, whether in business, offices, marriages, or any other thing for their advantage, preferably to all other persons whatsoever, even of equal merit.

And if men may, and frequently do, catch such a taste for cultivating flowers, for planting, grafting, inoculating, and the like, as to despise all other amusements for their sake, why may not we expect they should acquire a relish for that more useful culture of young minds? Thomson says:

'Tis joy to see the human blossoms blow,  
When infant reason grows apace and calls  
For the kind hand of an assiduous care.  
Delightful task! to rear the tender thought,  
To teach the young idea how to shoot;  
To pour the fresh instruction o'er the mind,  
To breathe the enlivening spirit, and to fix  
The generous purpose in the glowing breast.

That a house be provided for the academy, if not in the town, not many miles from it: the situation high and dry, and, if it may be, not far from a river, having a garden, orchard, meadow, and a field or two.

That the house be furnished with a library if in the country (if in the town the town libraries may serve), with maps of all countries, globes, some mathematical instruments, an apparatus for experiments in natural philosophy and for mechanics; prints of all kinds, prospects, buildings, and machines.

That the rector be a man of good understanding, good morals, diligent and patient, learned in the languages and sciences, and a correct, pure speaker and writer of the English tongue; to have such tutors under him as shall be necessary.

That the boarding scholars diet together, plainly, temperately, and frugally.

That to keep them in health, and to strengthen and render active their bodies, they be frequently exercised in running, leaping, wrestling, and swimming.

That they have peculiar habits to distinguish them from other youth, if the academy be in or near the town; for this, among other reasons, that their behavior may be the better observed.

As to their studies, it would be well if they could be taught everything that is useful and everything that is ornamental. But art is long and their time is short. It is therefore proposed that they learn those things that are likely to be most useful and most ornamental, regard being had to the several professions for which they are intended.

All should be taught to write a fair hand, and swift, as that is useful to all. And with it may be learned something of drawing, by imitation of prints, and some of the first principles of perspective.

Arithmetic, accounts, and some of the first principles of geometry and astronomy.

The English language might be taught by grammar, in which some of our best writers, as Tillotson, Addison, Pope, Algernon, Sidney, Cato's Letters, etc., should be classics, the styles principally to be cultivated being the clear and the concise. Reading should also be taught, and pronouncing properly, distinctly, emphatically, not with an even tone, which underdoes, nor a theatrical, which overdoes nature.

To form their style they should be put on writing letters to each other, making

abstracts of what they read or writing the same things in their own words, telling or writing stories lately read in their own expressions, all to be revised and corrected by the tutor, who should give his reasons and explain the force and import of words.

To form their pronunciations, they may be put on making declamations, repeating speeches, and delivering orations: the tutor assisting at the rehearsals, teaching, advising, and correcting their accent.

But if history be made a constant part of their reading, such as the translation of the Greek and Roman historians, and the modern histories of ancient Greece and Rome, may not almost all kinds of useful knowledge be that way introduced to advantage, and with pleasure to the student? As

Geography, by reading with maps, and being required to point out the places where the greatest actions were done, to give their old and new names, with the bounds, situation, and extent of the countries concerned.

Chronology, by the help of Helvicius or some other writer of the kind, who shall enable them to tell when those events happened, what princes were contemporaries, and what States or famous men flourished about that time. The several principal epochs to be first well fixed in their memories.

Ancient customs, religious and civil, being frequently mentioned in history, will give occasion for explaining them; in which the prints of medals, basorilievos, and ancient monuments will greatly assist.

Morality, by descanting and making continual observations on the causes of the rise and fall of any man's character, fortune, and power, mentioned in history; the advantages of temperance, order, frugality, industry, and perseverance. Indeed, the general natural tendency of reading good history must be to fix in the minds of the youth deep impressions of the beauty and usefulness of virtue of all kinds, public spirit, and fortitude.

History will show the wonderful effects of oratory, in governing, turning, and leading great bodies of mankind, armies, cities, nations. When the minds of youth are struck with admiration at this, then is the time to give them the principles of that art, which they will study with taste and application. Then they may be made acquainted with the best models among the ancients, their beauties being particularly pointed out to them. Modern political oratory being chiefly performed by the pen and press, its advantages over the ancients in some respects are to be shown; as that its effects are more extensive, and more lasting.

History will also afford frequent opportunities of showing the necessity of a public religion, from its usefulness to the public; the advantage of a religious character among private persons; the mischief of superstition, and the excellency of the Christian religion above all others, ancient or modern.

History will also give occasion to expatiate on the advantage of civil orders and constitutions; how men and their properties are protected by joining in societies and establishing government; their industry encouraged and rewarded, arts invented, and life made more comfortable; the advantages of liberty, mischiefs of licentiousness, benefits arising from good laws and a due execution of justice. Thus may the first principles of sound politics be fixed in the minds of youth.

On historical occasions questions of right and wrong, justice and injustice, will naturally arise, and may be put to youth, which they may debate in conversation and in writing. When they ardently desire victory for the sake of the praise attending it they will begin to feel the want and be sensible of the use of logic or the art of reasoning to discover truth and of arguing to defend it and convince adversaries. This would be the time to acquaint them with the principles of that art. Grotius, Puffendorff, and some other writers of the same kind may be used on these occasions to decide their disputes. Public disputes warm the imagination, whet the industry, and strengthen the natural abilities.

When youth are told that the great men whose lives and actions they read in history spoke two of the best languages that ever were, the most expressive, copious, beautiful, and that the finest writings, the most correct compositions, the most perfect productions of human wit and wisdom are in those languages which have endured for ages and will endure while there are men; that no translation can do them justice or give the pleasure found in reading the originals; that those languages contain all science; that one of them is become almost universal, being the language of learned men in all countries, and that to understand them is a distinguished ornament, they may be thereby made desirous of learning those languages, and their industry sharpened in the acquisition of them. All intended for divinity should be taught the Latin and Greek; for physic, the Latin, Greek, and French; for law, the Latin and French; merchants, the French, German, and Spanish; and, though all should not be compelled to learn Latin, Greek, or the modern foreign languages, yet none that have an ardent desire to learn them should

be refused; their English, arithmetic, and other studies absolutely necessary being at the same time not neglected.

If the new Universal History were also read, it would give a connected idea of human affairs, so far as it goes, which should be followed by the best modern histories, particularly of our mother country; then of these colonies; which should be accompanied with observations on their rise, increase, use to Great Britain, encouragements and discouragements, the means to make them flourish and secure their liberties.

With the history of men, times, and nations should be read at proper hours or days some of the best histories of nature, which would not only be delightful to youth, and furnish them with matter for their letters, as well as other history, but would afterwards be of great use to them, whether they are merchants, handicrafts, or divines; enabling the first the better to understand many commodities and drugs, the second to improve his trade or handicraft by new mixtures and materials, and the last to adorn his discourses by beautiful comparisons, and strengthen them by new proofs of divine providence. The conversation of all will be improved by it, as occasions frequently occur of making natural observations, which are instructive, agreeable, and entertaining in almost all companies. Natural history will also afford opportunities of introducing many observations, relating to the preservation of health, which may be afterwards of great use. Arbuthnot on Air and Aliment, Sanctorious on Perspiration, Lemery on Foods, and some others, may now be read, and a very little explanation will make them sufficiently intelligible to youth.

While they are reading natural history, might not a little gardening, planting, grafting, and inoculating be taught and practiced, and now and then excursions made to the neighboring plantations of the best farmers, their methods observed and reasoned upon for the information of youth, the improvement of agriculture being useful to all and skill in it no disparagement to any?

The history of commerce, of the invention of arts, rise of manufacture, progress of trade, change of its seats, with the reasons and causes, may also be made entertaining to youth, and will be useful to all. And this, with the accounts in other history of the prodigious force and effect of engines and machines used in war, will naturally introduce a desire to be instructed in mechanics and to be informed of the principles of that art by which weak men perform such wonders, labor is saved, and manufactures expedited. This will be the time to show them prints of ancient and modern machines, to explain them and let them be copied, and to give lectures in mechanical philosophy.

With the whole should be constantly inculcated and cultivated that benignity of mind which shows itself in searching for and seizing every opportunity to serve and to oblige, and is the foundation of what is called good breeding, highly useful to the possessor, and most agreeable to all.

The idea of what is true merit should also be often presented to youth, explained and impressed on their minds, as consisting in an inclination, joined with an ability, to serve mankind, one's country, friends, and family; which ability is, with the blessing of God, to be acquired or greatly increased by true learning; and should, indeed, be the great aim and end of all learning.

---

## APPENDIX II.

### CONSTITUTIONS OF THE PUBLIC ACADEMY IN THE CITY OF PHILADELPHIA.

As Nothing can more effectually contribute to the Cultivation & Improvement of a Country, the Wisdom, Riches, and Strength, Virtue and Piety, the Welfare and Happiness of a People, than a proper Education of Youth, by forming their Manners, imbuing their tender Minds with Principles of Rectitude and Morality, instructing them in the dead & living Languages, particularly their Mother-Tongue, and all useful Branches of liberal Arts and Science,

For attaining these great & important Advantages, so far as the present State of our infant Country will admit, and laying a Foundation for Posterity to erect a Seminary of Learning more extensive and suitable to their future Circumstances, An Academy for teaching the Latin & Greek Languages, the English Tongue, grammatically and as a Language, the most useful living foreign Languages, French, German and Spanish: As Matters of Erudition naturally flowing from the Languages, History, Geography, Chronology, Logick and Rhetorick; Writing, Arithmetick, Algebra, the several Branches of the Mathematicks, Natural & Mechanick Philosophy, Drawing in Perspective, and every other useful

	Thos. Green Smith, Professor

Part of Learning and Knowledge, shall be set up, maintained, and have Continuance, in the City of Philadelphia in Manner following Twenty-four Persons, to wit, James Logan, Thomas Lawrence, William Allen, John Inglis, Tench Francis, William Masters, Lloyd Zachery, Samuel McCall Jun., Joseph Turner, Benjamin Franklin, Thomas Leech, William Shippen, Robert Strettell, Philip Syng, Charles Willing, Phineas Bend, Richard Peters, Abraham Taylor, Thomas Bond, Thomas Hopkinson, William Plumsted, Joshua Maddox, Thomas White & William Coleman.

All of the City of Philadelphia, shall be Trustees, to begin, and carry into Execution, this good and pious Undertaking; who shall not for any Services, by them as Trustees performed, claim or receive any Reward or Compensation. Which Number shall always be continued, but never exceeded upon any Motive whatever.

When any Trustee shall remove his Habitation far from the City of Philadelphia, reside beyond Sea, or die, the remaining Trustees shall, with all convenient Speed, proceed to elect another, residing in or near the City, to fill the Place of the absents or deceased Person.

The Trustees shall have general Conventions once in every Month, and may, on special Occasions, meet at other Times on Notice, at some convenient Place within the City of Philadelphia, to transact the Business incumbent on them, and shall, in the Gazette, advertise the Time and Place of their general Conventions.

Nothing shall be transacted by the Trustees, or under their Authority alone, unless the same be voted by a Majority of their whole Number, if at a general Convention, and if at a special Meeting, by the like Majority, upon personal Notice given to each Trustee, at least one day before, to attend.

The Trustees shall, at their first Meeting, elect a President for one Year, whose particular Duty it shall be when present, to regulate their Debates, and state the proper Questions arising from them, and to order Notices to be given, of the Times and Places of their special Conventions. And the like Election shall be annually made, at their first Meeting, after the Expiration of each Year.

The Trustees shall annually choose one of their own Members for a Treasurer, who shall receive all Donations and Money due to them, and disburse and lay out the same, according to their Orders, and at the end of each Year, pay the Sum remaining in his Hands to his successor.

All Contracts and Assurances for Payment of Money to them, shall be made in the Name of the Treasurer for the Time being, and declared to be in Trust for the Use of the Trustees.

The Trustees may appoint a Clerk, whose Duty in particular it shall be, to attend them in their general and special Conventions; to give Notice in Writing to the Members of the Time, & Place, and Design, of any special Meetings; to register all their Proceedings; and extract a State of their Accounts annually, to be published in the Gazette; for which they may pay him such Salary as they shall think reasonable.

The Trustees shall, with all convenient speed, after signing these Constitutions, contract with any Person that offers, who they shall judge most capable of teaching the Latin and Greek Languages, History, Geography, Chronology, and Rhetorick; having great Regard at the same time to his Polite Speaking, Writing, and Understanding the English Tongue; which Person shall in Fact be, and shall be stiled, the Rector of the Academy.

The Trustees may contract with the Rector for the Term of Five Years, or less, at their discretion, for the Sum of Two Hundred Pounds a Year.

The Rector shall be obliged, without the assistance of any Usher, to teach twenty Scholars, the Latin and Greek Languages, and at the same time, according to the best of his Capacity, to instruct them in History, Geography, Logick, Rhetorick, and the English Tongue; and Twenty-five Scholars more for every Usher provided for him, who shall be entirely subject to his Direction.

The Rector shall upon all Occasions, consistent with his Duty in the Latin School, assist the English Master, in improving the Youth under his Care, and superintend the Instruction of all the Scholars in the other Branches of Learning, taught within the Academy, and see that the Masters in each Art and Science perform their Duties.

The Trustees, shall, with all convenient Speed, contract with any Person that offers, who they shall judge most capable, of teaching the English Tongue grammatically, and as a Language, History, Geography, Chronology, Logick and Oratory, which Person shall be stiled the ENGLISH MASTER.

The Trustees may contract with the English Master for the Term of Five Years, or less, at their Discretion, for the sum of One Hundred Pounds a Year.

The English Master shall be obliged without the assistance of any Usher, to

teach Forty Scholars the English Tongue grammatically, and as a Language; and at the same Time, according to the best of his Capacity, to instruct them in History, Geography, Chronology, Logick, and Oratory; and Sixty Scholars more for every Usher provided for him.

The Ushers for the Latin and Greek School, shall be admitted, and at Pleasure removed, by the Trustees and the Rector, or a Majority of them.

The Ushers for the English School shall be admitted, and at Pleasure removed, by the Trustees and the English Master, or a Majority of them.

The Trustees shall contract with the Usher, to pay him what they shall judge proportionable to his Capacity and Merit.

NEITHER the Rector, nor English Master shall be removed, unless disabled by Sickness, or other natural infirmity, or for gross voluntary Neglect of Duty, continued after two Admonitions from the Trustees, or for committing infamous Crimes; and such Removal be voted by three Fourths of the Trustees; after which their Salaries respectively shall cease.

The Trustees shall, with all convenient Speed, endeavor to engage Persons capable of teaching the French, Spanish, and German Languages, Writing, Arithmetick, the several Branches of the Mathematicks, Natural and Mechanic Philosophy, and Drawing; who shall give their Attendance, as soon as a sufficient Number of Scholars shall offer to be instructed in those Parts of Learning; and be paid such Salaries and Rewards, as the Trustees shall from Time to Time be able to allow.

EACH Scholar shall pay such Sum or Sums, quarterly, according to the particular Branches of Learning they shall desire to be taught, as the Trustees shall from Time to Time settle and appoint.

No Scholar shall be admitted, or taught within the Academy, without the Consent of the major Part of the Trustees in Writing, signed with their Names.

IN Case of the Disability of the Rector, or any Master established on the Foundation, by receiving a certain Salary, through Sickness or any other natural infirmity, whereby he may be reduced to Poverty, the Trustees shall have Power to contribute to his Support, in Proportion to his Distress and Merit, and the stock in their Hands.

FOR the Security of the Trustees, in contracting with the Rector, Masters and Ushers; to enable them to provide and fit up convenient Schools; furnish them with Books of general Use, that may be too expensive for each Scholar; Maps, Draughts, and other Things, generally necessary, for the Improvement of the Youth; and to bear the incumbent Charges that will unavoidably attend this Undertaking, especially in the beginning: the Donations of all Persons inclined to encourage it, are to be cheerfully and thankfully accepted.

THE Academy shall be open'd with all convenient Speed, by accepting the first good Master that offers, either for teaching the Latin and Greek, or English, under the Terms above proposed.

ALL Rules for the Attendance and Duty of the Masters, the Conduct of the Youth, and the facilitating their Progress in Learning and Virtue, shall be framed by the Masters, in Conjunction with the Trustees.

IF the Scholars shall hereafter grow very numerous, and the Funds be sufficient, the trustees may at their Discretion, augment the Salaries of the Rector or Masters.

THE Trustees, to increase their Stock, may let their money out at interest.

IN general, the Trustees shall have Power to dispose of all Money, received by them, as they shall think best for the Advantage, Promotion, and even Enlargement of this Design.

THE Trustees may hereafter add to or change any of these Constitutions, except that hereby declared to be invariable.

ALL Trustees, Rectors, Masters, Ushers, Clerks, and other Ministers, hereafter to be elected or appointed, for carrying this Undertaking into Execution, shall, before they be admitted to the Exercise of their respective Trusts or Duties, sign these Constitutions, or some others to be hereafter framed by the Trustees in their Stead, in Testimony of their then approving of, and resolving to observe them.

UPON the Death or Absence as aforesaid of any Trustee, the remaining Trustees shall not have Authority to exercise any of the Powers reposed in them, until they have chosen a new Trustee in his Place, and such new Trustee shall have signed the established Constitutions, which if he shall refuse to do, they shall proceed to elect another; and so toties quoties until the Person elected shall sign the Constitution.

WHEN the Fund is sufficient to bear the Charge, which it is hoped thro' the Bounty and Charity of well disposed Persons, will soon come to pass, poor Children shall be admitted, and taught gratis, what shall be thought suitable to their Capacities and Circumstances.

IT is hoped and expected, that the Trustees will make it their Pleasure, and in some Degree their business, to visit the Academy often, to encourage and countenance the Youth, countenance and assist the Masters, and by all Means in their Power, advance the Usefulness and Reputation of the Design; that they will look on the Students as, in some measure, their own Children, treat them with Familiarity and Affection; and when they have behaved well, gone thro' their Studies, and are to enter the World, they shall zealously unite, and make all the Interest that can be made, to promote and establish them, whether in Business, Offices, Marriages, or any other Thing for their Advantage, preferable to all other Persons whatsoever, even of equal Merit.

THE Trustees shall in a Body visit the Academy once a Year extraordinary, to view and hear the performances and Lectures of the Scholars, in such Modes, as their respective Masters shall think proper, and shall have Power, out of their Stock, to make presents to the most meritorious Scholars, according to their several deserts.

N. B. The above Constitutions were signed on the 13th of November, 1749; and are to be carried into Execution as early as may be in the ensuing Year, a considerable Sum being already subscribed for that Purpose by a few Hands: who hope, from the known Publick Spirit of the People of Pennsylvania, that such farther Sums as are necessary to be subscribed for perfecting this useful Design, will not be wanting.

## CHAPTER III.

### THE COLLEGE-BRED NEGRO.<sup>a</sup>

The following information has been selected (in large part reprinted verbatim) from a report of the results of a social study, made under the direction of Atlanta University, to the Fifth Conference for the Study of Negro Problems, held at Atlanta University,<sup>b</sup> May 29-30, 1900. The report referred to was drawn up by W. E. Burghardt DuBois, Ph. D., corresponding secretary of the conference. Appended to this chapter is an argument by President Bumstead of Atlanta University in favor of the higher education of the negro.

The general idea of the Atlanta Conference is to select among the various and intricate questions arising from the presence of the negro in the South, certain lines of investigation which will be at once simple enough to be pursued by voluntary effort, and valuable enough to add to our scientific knowledge. At the same time the different subjects studied each year have had a logical connection, and will in time form a comprehensive whole. The starting point was the large death rate of the negroes; this led to a study of their condition of life, and the efforts they were making to better that condition. These efforts, when studied, brought clearly to light the hard economic struggle through which the emancipated slave is to-day passing, and the conference therefore took up one phase of this last year. This year the relation of educated negroes to these problems, and especially to the economic crisis, was studied.

Schedules of inquiry, containing 26 questions, were sent out to nearly 2,500 negro graduates; returns more or less complete were received from 1,252. Any graduate who had received the degree of B. A. or B. S. from an institution which had "a course amounting to at least one year in addition to the course of the ordinary New England high school," was considered a college graduate for the purposes of the inquiry.

---

<sup>a</sup>See also an article entitled "The education of the negro," by Prof. Kelley Miller, of Howard University, in Vol. 1 of the Report of 1900-01, chap. 16. That article contains a number of tables and some other matter from Dr. DuBois's report not reprinted in this chapter.

<sup>b</sup>Atlanta University is an institution for the higher education of negro youth. It seeks, by maintaining a high standard of scholarship and deportment, to sift out and train thoroughly talented members of this race to be leaders of thought and missionaries of culture among the masses.

Furthermore, Atlanta University recognizes that it is its duty as a seat of learning to throw as much light as possible upon the intricate social problems affecting these masses, for the enlightenment of its graduates and of the general public. It has, therefore, for the last five years, sought to unite its own graduates, the graduates of similar institutions, and educated negroes in general, throughout the South, in an effort to study carefully and thoroughly certain definite aspects of the negro problems.

Graduates of Fisk University, Berea College, Lincoln University, Spelman Seminary, Clark University, Wilberforce University, Howard University, the Meharry Medical College, Hampton and Tuskegee Institutes, and several other institutions have kindly joined in this movement and added their efforts to those of the graduates of Atlanta, and have, in the last five years, helped to conduct five investigations: One, in 1896, into the "Mortality of negroes in cities;" another, in 1897, into the "General social and physical condition" of 5,000 negroes living in selected parts of certain Southern cities; a third, in 1898, on "Some efforts of American negroes for their own social betterment;" a fourth, in 1899, into the number of negroes in business and their success. Finally, in 1900, inquiry has been made into the number, distribution, occupations, and success of college-bred negroes.—*From the Introduction.*

The number of negro college graduates, with their date of graduation, was ascertained to be as follows:

*Number of negro graduates.*

	From—	
	Negro colleges.	White colleges.
Before 1876.....	137	75
1876-1880.....	143	22
1880-1885.....	250	31
1885-1890.....	413	43
1890-1895.....	465	66
1895-1899.....	475	88
Class unknown.....	58	64
Total.....	1,941	390

"The report for 1899 is incomplete.

NEGRO GRADUATES FROM WHITE COLLEGES.

In corresponding with white colleges, for the purpose of procuring information bearing upon the subject of the inquiry, most of the colleges addressed confined themselves to furnishing a simple list of graduates; some, however, added information as to the standing and character of their negro students, information which is considered all the more valuable from its having been unsolicited; others made some statement of the conditions regarding the admission of negro students. The following extracts will serve to show the trend of these observations:

From the University of Kansas we learn (January, 1900): "I am pleased to state that this year we have twice as many colored students in attendance at the university as ever before; in all, 28. The rule is that no student shall be allowed to take more than three studies. If he fails in one of the three, it is a 'single failure;' in two of the three, a 'double failure.' The latter severs the student's connection with the university. There are 1,090 students in attendance at the present time. The semiannual examination was held last week, and as a result there are 200 'single failures' and 80 'double failures.' The gratifying part of it is that not one of the 28 colored students is in either number."

From Bates College, Scranton, Me., President Chase writes (February, 1900): "We have had about a dozen colored people who have taken the full course for the degree of A. B. at Bates College, one of them a young woman. They have all of them been students of good character and worthy purpose." One was "remarkably fine scholar, excelling in mathematics and philosophy;" he was "one of the editors of the Bates Student while in college." Another was "an honest, industrious man of good ability, but of slight intellectual ambition." A third "was a good scholar, especially in mathematics." A fourth graduated "with excellent standing. He was a good all-around scholar, but excellent in the classics." A fifth "acquired knowledge with difficulty." A sixth did work "of a very high order," etc.

The secretary of Oberlin writes (February, 1900) in sending his list: "It is a list containing men and women of whom we are proud."

Colgate University, New York writes of a graduate of 1874 as "a very brilliant student," who "was graduated second best in his class. It was believed by many that he was actually the leader."

A graduate of Colby College, Maine, is said by the librarian to have been "universally respected as a student, being chosen class orator."

Wittenberg College, Ohio, has two colored graduates. "They were both bright girls and stood well up in their respective classes."

A negro graduate of Washburn College, Kansas, is said by the chairman of the faculty to be "one of the graduates of the college in whom we take pride."

The dean of the faculty of Knox College, Illinois, writes of two negro students, Senator Bruce, of Mississippi, and another, who graduated and was remembered because of "his distinguished scholarship."

A black student of Adrian College, Michigan, "was one of the best mathematicians I ever had in class," writes a professor.

Adelbert College, of the Western Reserve University, Ohio, has a negro graduate as acting librarian, who is characterized as "one of the most able men we know;" while of another it is said, "we expect the best."

Lombard University, Illinois, has "heard favorable reports" of its single negro graduate.

The dean of the State University of Iowa writes (December, 1899) of a graduate of 1898: "He distinguished himself for good scholarship, and on that ground was admitted to membership in the Phi Beta Kappa Society. He is a man of most excellent character and good sense, and I expect for him a very honorable future. He won the respect of all his classmates and of the faculty. As president of the Phi Beta Kappa Society I received him into membership with very great pleasure as in every way worthy of this honor. We have three colored people in the university at present; two in the collegiate department and one in law. You are aware that we have but a small colored population in Iowa. In all cases colored young men in the university receive the very best treatment from instructors and students." \* \* \*

Boston University writes of one graduate as "a fine fellow." He is now doing post-graduate work at Yale, and the agent of the Capon Springs Negro Conference writes (November, 1900) that "I continually hear him mentioned in a complimentary way. On the other hand, two negro boys were in the freshman class not long ago and were both conspicuously poor scholars."

Otterbein University, Ohio, has a graduate who "was a most faithful and capable student."

The dean of Dartmouth College, New Hampshire, writes (December, 1899) of their graduates: "The last two or three are hardly established in business yet, but the others are doing remarkably well. These men have been in each case fully equal to, if not above, the average of their class. We have been very much pleased with the work of the colored men who have come to us. They have been a credit to themselves and their race while here and to the college since graduation. I wish we had more such."

The president of Tabor College, Ohio, says of two colored graduates: "They are brainy fellows who have done very much good in the world."

A graduate of Southwest Kansas College "was one of the truest, most faithful and hard-working students that we ever had."

One of the most prominent Methodist ministers in Philadelphia said to the president of Allegheny College, Pennsylvania, speaking of a colored graduate: "Any college may be proud to have graduated a man like him."

The University of Idaho graduated in 1898 a young colored woman of "exceptional ability."

Westminster College, Pennsylvania, has graduated two negroes. "Both were excellent students and ranked high in the estimation of all who knew them."

Of a graduate of Hamilton College, New York, the secretary says: "He was one of the finest young men we have ever had in our institution. He was an earnest and consistent Christian, and had great influence for good with his fellow students. No one ever showed him the slightest discourtesy. On leaving college, he spent three years in Auburn Theological Seminary; was licensed to preach by one of our Northern Presbyteries, and then went to Virginia, near Norfolk, where he built a church and gave promise of great usefulness, when, about two years ago, he suddenly sickened and died." \* \* \*

At the larger colleges the record of negro students has, on the whole, been good. At Harvard several have held scholarships, and one a fellowship; there has been 1 Phi Beta Kappa man, 1 class orator, 2 commencement speakers, 3 masters of art and 1 doctor in philosophy. In scholarship the 11 graduates have stood: 4 good, 3 fair, 2 ordinary, and 2 poor.

At Brown one of the most brilliant students of recent years was a negro; he was among the junior eight elected to the Phi Beta Kappa.

At Amherst the record of colored men has been very good, both in scholarship and athletics. A colored man captained the Amherst football team one year and he is now one of the chief Harvard football coaches.

At Yale and Cornell colored men have held scholarships, and some have made good records.

Among the women's colleges the color prejudice is much stronger and more unyielding. The secretary of Vassar writes (December, 1900): "We have never had but one colored girl among our students, and as no one knew during her course that she was a negro, there was never any discussion of the matter. This young woman graduated from the college, and although it is now well known that she is a negro, the feeling of respect and affection that she won during her

college course has not been changed on the part of those who knew her here. There is no rule of the college that would forbid our admitting a colored girl, but the conditions of life here are such that we should hesitate for the sake of the candidate to admit her, and in fact should strongly advise her for her own sake not to come."

Barnard College, New York, the new woman's adjunct of Columbia, says (December, 1900): "No one of negro descent has ever received our degree, and I can not say whether such a person would be admitted to Barnard, as the question has never been raised; but there is nothing in our regulations that excludes any one of any nationality or race."

Wells College and Elmira College, New York, both agree in saying that they never have had negro students and "do not know what would be the policy of the board of trustees if such a person should make application for admission."

A prominent Southern institution, the Randolph-Macon Woman's College, of Lynchburg, Va., writes frankly: "We entirely favor the education of negroes to any degree they may wish, but are not prepared to enter upon the work ourselves. We believe that in all boarding schools and colleges the races must, for the good of both, be educated separately."

In the West the sentiment is more favorable. The president of Rockford College, Ill., writes: "I think that no one of negro descent has ever received the bachelor's degree from this college. In 1889-90 such a lady came here from St. Louis. This one was here only about two years, I believe. She afterwards married. Persons of negro descent, if able to meet our requirements, would be received here. So far as I know, however, this is the only such student that we have had; but before she left us, she had made herself very popular with her fellow students."

The trustees of Mills College for women, in Alameda County, Cal., "decided some years ago that it was not best for us to receive such students."

In New England there is usually no barrier, although Mount Holyoke puts the statement negatively: "We do not refuse admission to colored persons, but we seldom have application for this class of candidates."

They have one negro graduate from Smith College, we learn: "Our first colored student graduated last year with the degree of A. B. \* \* \* We also have two students of negro descent in our present senior class. No person is refused admission to Smith on account of color, provided she is able to meet our requirements for entrance. Miss ——— was an excellent student, and very popular."

Wellesley had quite a number of colored students, of whom two graduated. "Both these young women had more than average ability, and one did brilliant work."

Radcliffe College, the Harvard "annex," has two colored graduates, who are well spoken of.

In all Northern institutions there have appeared, from time to time, black students as well as white who lacked ability to do the required work. The negroes of this sort are of course always conspicuous. It is naturally much easier to convince an average American group of a negro's inferior attainments than of any unusual ability in any line. So that one such student has often done more by his failure to form public opinion than several others by their success. Then, too, there has been, in some instances, a tendency to coddle black students simply because they were black; in some cases scholarships have been granted them, and pass marks given which in strict competition they did not earn. Of course these cases are more than balanced by the opposite kind, where the prejudice and unconscious bias of students and instructors have made life so intolerable for some lonely black student that he has given up in despair, or done far poorer work than he might have done. In the older institutions all these phases are now passing away, and the black student is beginning to be received simply as a student, without assumptions as to his ability or deserts until he has given evidence in his work and character.

Besides the negroes who have graduated from these colleges, there has been a large number who have pursued a partial course, but taken no degree. They have dropped out for lack of funds, poor scholarship, and various reasons. Then, too, many institutions having no graduates have promising candidates at present. The registrar of the University of Illinois informs us "that so far no negro has ever been graduated from the University of Illinois. One member of our present senior class is a negro, and he will doubtless be graduated next June. He is a good scholar, and is very much respected in the University. He is this year the editor of the student's paper."

Wabash College, Indiana, "has had frequently colored students enrolled in her classes, but none have completed their course. We have at present two colored students in attendance at college."

Dickinson College, Pennsylvania, "has never conferred a degree upon a negro. We have two at present time in attendance at the College: One, Miss ———, a member of the freshman class, and the other, Mr. ———, a member of the junior class, and one of the brightest scholars and most highly esteemed gentlemen in attendance at our institution."

The universities of Wyoming, Montana, and California, have all had, at one time or another, colored students.

Syracuse University has three negro students now, "especially bright and promising."

The University of Vermont dropped two colored members of the class of 1897 "on account of inability to do the work."

Wheaton College, Illinois, has "had many colored students, and some good ones, but none of them has gained the degree of A. B."

Among the colleges who have never had any negro students it is not easy to learn how many would actually refuse such students. Most of the replies are noncommittal on this point, as in the case of John Hopkins. "No colored man has ever been a candidate for a degree here."

So, too, from Bryn Mawr they write: "President Thomas desires me to acknowledge the receipt of your letter, and to say that no person of negro descent has ever applied for admission to Bryn Mawr College, probably because the standard of the entrance examinations is very high and no students are admitted on certificate."

The attitude of Princeton is thus defined (December, 1900): "The question of the admission of negro students to Princeton University has never assumed the aspect of a practical problem with us. We have never had any colored students here, though there is nothing in the university statutes to prevent their admission. It is possible, however, in view of our proximity to the South and the large number of Southern students here, that negro students would find Princeton less comfortable than some other institutions; but I may be wrong in this, as the trial has never been made. There is, as I say, nothing in the laws of the college to prevent their admission."

In other places, usually smaller Western schools, the attitude is quite cordial. "I am sorry to say that we have no negro graduates as yet," writes Carleton College, Minnesota. Whitman College, Washington, says: "We should be glad to receive any negroes if they were to apply, but there are few in this section of the country." The University of Oregon says the same thing.

To sum up, then: Negroes have graduated from Northern institutions. In most of the larger universities they are welcome and have, on the whole, made good records. In nearly all the Western colleges they are admitted freely, and have done well in some cases and poorly in others. In one or two larger institutions, and in many of the large women's colleges, negroes, while not exactly refused admission, are strongly advised not to apply. The summer schools at Harvard, Clark, and the University of Chicago, have several negro students.

#### BIRTHPLACE OF COLLEGE-BRED NEGROES.

The birthplace of 646 college-bred negroes is given as follows:

South Carolina .....	95	Rhode Island .....	1
North Carolina .....	80	Connecticut .....	1
Tennessee .....	73	Vermont .....	1
Virginia .....	60	Colorado .....	1
Georgia .....	55	Pennsylvania .....	17
Mississippi .....	48	Missouri .....	12
Alabama .....	34	Louisiana .....	12
Ohio .....	34	Illinois .....	11
Kentucky .....	25	District of Columbia .....	10
Maryland .....	17	Texas .....	9
Indiana .....	4	Kansas .....	9
Massachusetts .....	3	New York .....	5
West Virginia .....	3	Arkansas .....	4
Iowa .....	3	Florida .....	4
New Jersey .....	2	Delaware .....	1
Michigan .....	2		

## In foreign lands:

Hayti .....	4
West Indies .....	3
West Africa .....	2
Ontario .....	1

North .....	30
South .....	542
West .....	64
Abroad .....	10
Total .....	646

The most interesting question connected with birthplace is that of the migration of colored graduates—that is, where these men finally settle and work. If we arrange these 600 graduates according to sections where they were born and where they now live, we have this table:

*Migration of college graduates.*

Persons born in—	Are now living in—											
	A.	B.	C.	D.	E.	F.	G.	H.	J.	K.	L.	M.
A. New England .....	2	1	3	1	1							
B. New York, Pennsylvania, New Jersey .....	1	10	5	1	1		5	1		1		
C. Delaware, Maryland, Virginia, West Virginia, Kentucky, Tennessee, North Carolina, Missouri, District of Columbia .....	4	18	148	39	12	4	26	1	1		1	
D. South Carolina, Georgia, Florida, Mississippi, Louisiana, Alabama .....	3	8	35	159	6	1	26					1
E. Michigan, Wisconsin, Illinois, Ohio .....		2	7	4	9	1	5					1
F. North and South Dakota, Minnesota, Nebraska, Iowa, Kansas .....				4		5	2					
G. Oklahoma, Texas, Arkansas, Indian Territory .....			3	1	4	1	5					
H. Canada .....			2									
J. Africa .....				2								
K. West Indies .....		3	3	2			2			2		
L. California, Nevada, Washington, Oregon .....				2								
M. New Mexico, Arizona .....												

This means that of 254 college-bred negroes born in the border States (i. e., Delaware, Maryland, Virginia, Kentucky, Tennessee, North Carolina, Missouri, and the District of Columbia), 148 or 58 per cent stayed and worked there; 39 or 15 per cent went farther South; 26 or 10 per cent went Southwest; 12 or 5 per cent went to the middle West, etc. Or again:

Of 73 college graduates born North, 35 stayed there and 38 went South.

Of 507 college graduates born South, 443 stayed there and 62 went North.

These statistics cover only about one-fourth of the total number of graduates, but they represent pretty accurately the general tendencies so far as our observation has gone. It is therefore probably quite within the truth to say that 50 per cent of Northern-born college men come South to work among the masses of their people at a personal sacrifice and bitter cost which few people realize; that nearly 90 per cent of the Southern-born graduates, instead of seeking that personal freedom and broader intellectual atmosphere which their training has led them in some degree to conceive, stay and labor and wait in the midst of their black neighbors and relatives.

## WOMEN GRADUATES.

The number of negro women graduates, not including the graduates of 1899, is as follows:

Oberlin .....	55	Philander Smith .....	5
Shaw .....	21	Iowa Wesleyan .....	4
Paul Quinn .....	13	University of Kansas .....	3
Atlanta .....	8	Cornell .....	3
Southland .....	8	Geneva .....	2
Rust .....	7	Leland .....	1
Cliffin .....	6	University Iowa U .....	1

Idaho .....	1	Roger Williams .....	5
Bates .....	1	Berea .....	4
Clarke .....	1	University of Michigan .....	3
Straight .....	1	Wittenberg .....	2
Branch, Arkansas .....	1	Wellesley .....	2
Mount Holyoke .....	1	Butler .....	1
Fisk .....	31	Adrian .....	1
Wilberforce .....	19	McKendree .....	1
Knoxville .....	10	Virginia Normal and Collegiate .....	1
Howard .....	8	Allen .....	1
Central Tennessee .....	7	Paine Institute .....	1
Livingstone .....	6	Vassar .....	1
New Orleans .....	5		
Total women .....			253
Total men .....			2,272

Before the war 10 women graduated, as far as we have been able to ascertain; from 1861 to 1869, 36; from 1880 to 1889, 76; 1890 to 1898, 119.

The rapid increase of college-bred women in later years is noticeable, and the present tendency is toward a still larger proportion of women. Twenty-three per cent of the college students of Howard, Atlanta, Fisk, and Shaw were women in the school year of 1898-99. The economic stress will probably force more of the young men into work before they get through college and leave a larger chance for the training of daughters. A tendency in this direction is noticeable in all the colleges, and if it results in more highly trained mothers it will result in great good. Of 100 college-bred women reporting their conjugal condition, one-half had been married, against nearly 70 per cent of the men.

#### EARLY TRAINING.

There is little in the matter of early training that lends itself to statistical statement, but there is much of human interest. A number of typical lives are therefore appended which show in a general way the sort of childhood and youth through which these college-bred negroes have passed. First as to the men:

#### *Men.*

"My early life was spent in the schools of the American Missionary Association. I attended Beach Institute and finally Atlanta University."

"I attended the public schools in Augusta, Ga., and sold papers, brushed boots, and worked in tobacco factories. While in college I taught school in summer time."

"Born in Springfield, Mass., where I attended the public schools, and acted as driver and hotel waiter. I attended Fisk University and during vacations taught school, worked in a sawmill, waited on table, and acted as Pullman porter."

"My parents were old and poor and I worked my way through school and helped to support them by manual labor."

"I came to Texas with my parents about 1876, and attended the Galveston public schools. I then went to college, assisted in part by my parents and in part by my own efforts. The expenses of the last two years were paid by a scholarship which I won by examination."

"I spent most of my youth with my uncle, a merchant in Florence, S. C., where I attended the public school, which was poor. I afterwards worked five years on my father's farm, and finally went to college."

"I attended public schools in Virginia, working in white families morning and night for my board. I then worked my way through a normal course, and finally through Hillsdale College."

"I was a farmer before going to school. My church conference sent me to school. My parents were poor and my mother died when I was but 4 years old."

"I came to Kansas when 9 years old and lived on a farm until I was 20, neither seeing or hearing from any of my relations during that time. In 1871 I went to Oberlin and began work in Ray's Third Part Arithmetic."

"I was born a slave in Prince Edward County, Va. I worked as a farmer and waiter and then went to Hampton Institute. After leaving Hampton I helped my parents a few years and then entered Shaw."

"I sold papers and went to school when a boy; I learned the brick-mason's trade of my father. After graduating from the high school I worked in the printing office of a colored paper, thus earning enough to go to college."

"I was born in Calvert County, Md., being one of 7 children. We lived at first in the log cabin which my father had built in slavery times. Soon we moved away from there and settled on a farm which my father commenced buying on shares. I went to school, worked on the farm, and taught school until I was 22, when I entered Lincoln."

"I was born in Crawford County, Ga. My father moved to Macon, then to Jones County, then back to Crawford County, then to the town of Forsyth, and finally to the State of Mississippi. I finally left home at the age of 16 and roamed about for two and a half years. I saved some money by work on a railroad and started to school."

"My parents, having been slaves, were poor. I was the fifth of 10 children, and the task of educating all of us was a serious one for the family. My parents made every sacrifice, and at 9 years of age I was helping by selling papers on the streets of Pittsburg, and colored papers among the negroes on Saturday. After completing the common schools I worked as elevator boy and bootblack, and finally at the age of 15 was enabled to enter the engineering course of the Western University of Pennsylvania."

"I was born in a stable; my father died when I was 2 years old. I blacked boots and sold sulphur water to educate myself until I was 18."

"My mother and father took me from Alabama to Mississippi, where my father joined the Union Army at Corinth, leaving me with my mother, brother, and sister. We went to Cairo, Ill., and then to Island No. 10. There mother and brother died and my sister sent me to Helena, Ark., in charge of an aunt. My father died during the siege of Vicksburg, and I was sent to the orphanage in Helena, which afterwards became Southland College."

"My father died when I was 5 and my mother when I was 12, leaving me an orphan in the West Indies. At 14 I left home with a white man from Massachusetts. I went to school one year in Massachusetts, then shipped as a sailor and stayed on the sea ten years, and finally returning, started to school again."

"I was born in Alton, Ill., in 1864. In 1871 we moved to Mississippi, and happening to visit my grandfather at Wilberforce, Ohio, I begged him to let me stay there and enter school. He consented, and by housework, taking care of horses, and his help I got through school."

"I was born of slave parents who could neither read nor write. I had but five months' regular schooling until I was 17 years of age. Then I worked my way through a normal school in South Carolina, and thus gained a certificate to teach and helped myself on further in school."

"Father died about my ninth birthday, so I attended the public schools and worked on the farm to assist mother earn a livelihood for herself and the four children. Late in my teens, after three months' day labor upon the farm, railroad, wood chopping, etc., I entered Alcorn with the sum of \$20.50. By working there I was enabled to remain in school six years, the last five of which I secured work as a teacher in Wilkerson County. The money I obtained was used by myself, my two brothers, and a sister in common, as from time to time each joined me in college. Mother would accept very little of our earnings for herself, lest we might be deprived of an education."

"I was born and reared on my aged mother's farm near Thomastown, Miss. I began going to a country school at 12 years of age, having learned my A B C's under Uncle York Moss, at his Sunday school, where we used Webster's 'Blue-back.' My chances for attending even a country school were meager, for I had to help on the farm. Attending two and four months in the year, I got far enough advanced by the time I was 16 to teach a little and use my earnings in entering, first, Tougaloo and then Alcorn."

"I was reared on a farm and was 16 before I knew my letters and 21 before I spent a month in school."

"In early life I lived with my parents, who were ex-slaves and took great pride in working hard to educate their children. I attended the first Yankee schools established in Savannah. As soon as I could read, write, and figure a little I started a private afternoon school at my home, which I taught."

"I was born a slave. Soon after the fall of Port Royal, S. C., in 1861, three of us escaped from Charleston to Beaufort, and joined the Union forces. We were taken on the U. S. gunboat *Unadilla*. There I was attached to a lieutenant in the Forty-eighth New York Regiment of Volunteers, and remained with him until he was wounded before Fort Wagner. I then went North, attended night school in Portland, Me., and finally entered Howard University."

"I was the fifth child in a family of eleven. My father was a poor farmer and did not believe in education, so my training was neglected until I was able to work and help myself."

"I was born a slave and taken North to an orphanage by Quakers after the war, both my parents being dead. Afterwards I was sent to New Jersey, and then worked on a Pennsylvania farm until I went to Lincoln."

"My father was set free prior to the war and purchased my mother. He died when I was 8, leaving a little home and \$300 in gold. My mother was an invalid and we had to work at whatever came to hand, going to school from three to five months a year. At the age of 15 I stopped school and labored and taught a three-months' school at \$25 a month. Finally I entered Roger Williams University, working my way through and helping mother."

"Twelve years of my life was spent as a slave. I worked at driving cows, carrying dinner to the field hands, and running rabbits. My master owned 300 negroes, so that boys were not put in the field until they were 18. When I was freed I did not know a letter, but I worked my way through Webster's 'Blue-back' speller."

"I was born the slave of Jefferson Davis's brother and attended contraband schools before the close of the war."

"Mine was the usual life of a boy whose folks were comfortably circumstanced. School was the chief occupation. At 16 I went to sea as a cabin boy, and on returning entered Lincoln."

"I was raised partly on a Mississippi plantation and partly in and near New Orleans. For about two years I was with the Union Army as servant to an officer in a Vermont regiment. I went with him to Vermont, where I attended school and finally entered Dartmouth College."

"I had very little early training, and was apprenticed at the calker's trade from 12 to 16. At the age of 18 I joined the Fifty-fifth Massachusetts Volunteers, and was finally discharged on account of wounds. I then entered the preparatory department at Lincoln."

"Lived in Lebanon, Tenn., until 11 years old, when I joined a company of colored men and went to West Tennessee. I kept books and cooked for the company. I moved the whole family at last to West Tennessee, and bought and paid for a farm by raising cotton and teaching school. I then entered Fisk University, and by teaching and farming during vacations supported myself and two sisters in school."

"The greater portion of my early life was spent in East Tennessee, whither I had been brought away from my parents when only 5 years of age. My master kept me as errand boy about his store and house until the close of the war. By this time, under the tutelage of the white children of the family, I had learned to read. In the summer of 1865 I started out without a cent of money to try my own fortune in the world, working at anything I could find to do. I made considerable money, attended public schools, and finally entered Fisk University."

"Soon after the war my father built a log schoolhouse on a spot given him by his former master. I went to school seven months before my father died, after which I was compelled to go to work to support my widowed mother. At the age of 20 I entered school again."

"Born of a good woman in Mississippi, I left home while the war was raging and went to Alabama. There I finally went into the service of an ex-Confederate general, who sent me to the Burrell School, an institution fostered by the American Missionary Association. Afterwards I went to Tougaloo and Roger Williams."

"I lost my mother when I was only 1 year old. I was then sold as a slave to an aged French couple, who treated me as their child. Then, in 1862, I was sold again, taken to Texas, resold, and finally, when free, returned to New Orleans in 1869. I found my father dead, and so I went North and stayed there until I entered Fisk in 1876. I had had but little schooling up to this time—only what I had picked up at a night school and at an eight-months' free school in Texas."

"I was born in Raleigh, N. C., and emancipated in Pennsylvania in 1830. I went to school and learned the three R's and afterwards went to Ohio and entered Oberlin, working at my trade of gunmaker all through the course. I studied, because I found knowledge was power; I also found that I was a born mechanic. I never had the idea that education would elevate me into any profession whatsoever. My trade occupied my whole mind and thought."

"I was born of slave parents and worked when young in a tobacco factory. I was taught to read by an ex-Confederate soldier. I entered school right after the surrender of Lee and remained till I finished the college course."

"I had the advantage of a father who had a good education, for his time. He was free and able to conduct his business in Augusta, Ga., during slavery time. I quit school and served two years at a trade. A Northern teacher offered to help me finish my education and my parents gave me my time."

"My earliest recollections are of slavery, the perturbed conditions at the beginning and end of the war, the struggle of mother and grandmother under the new conditions, and the assumption of the support of the family by myself at the age of 10 years."

"My parents moved to Providence, R. I., when I was very young. I attended school about five years and night school one winter. Then I learned the barber's trade. During the winter of 1890-91 I decided to prepare myself for work among my people in the South and entered Livingstone College."

"My mother and I were sold away from my father, who lived in South Carolina, and taken first to Mississippi, and then to Banks County, Ga. Here, when I was 6 years of age, my master started me at work in a stable, with the purpose of making me learn the care of horses and become his carriage driver. I was freed in 1865, and then my mother and I walked to Newberry, S. C. (110 miles), and found father again. We were very poor and my parents had to hire me out for a year. Then they decided to send me to school and I went very irregularly from 1866 to 1874. I gained at last a State scholarship in the South Carolina College, but the Republicans, after two years, were forced out of power and the college closed to them. Finally I entered the Atlanta University."

"I was born in Buffalo, N. Y., in 1867, the son of the sexton of a large city church. I passed through the common and high schools of the city, and at the same time worked as office boy and waiter. In 1879 I came South to enter college and prepare for teaching."

"About the close of the war Confederate soldiers stole me from my parents in South Carolina and took me to Georgia. I ran away to Tennessee, where I worked as janitor in a white school and studied at night by the aid of the principal, who was very friendly. He afterwards sent me to Howard University."

"I was born in Richmond, Va., and when 3 years of age was sold with my mother, sister, and brother away from my father and taken to South Carolina. We have never seen father since. My new mistress taught me the alphabet, and after emancipation paid my expenses through school and college."

"I worked my way through college. I was the oldest of eight children, with father bitterly opposed to education, although he had a commanding mind and had heard lectures at the University of Virginia before the war. Have been practically the head of the family for over 12 years, and assisted and encouraged all the children to educate themselves. Five of them went or are going to school."

"My mother died when I was but 2 years old, and I was left to the care of my mother's mistress, who, though a slaveholder, cared for me as though I was her own child, until emancipation, when my father took charge of me and placed me in school under Northern teachers sent South by the Presbyterian board of education."

"I was reared on a farm; then became meat cook on a steamboat during vacation. I served two years and five months as first sergeant Company C, Fifty-fifth Massachusetts Volunteers, during the civil war, and was injured twice, at James Island and Honey Hill engagements. I made out contracts between ex-slaves and former masters in South Carolina in the Freedman's Bureau, under Gen. O. O. Howard, after being disabled."

"Until 15 years old I stayed with my grandparents, and followed the occupation of my grandfather, a gardener. From 15 till 17 I clerked in a colored grocer's store; from 17 till 19 I worked in a colored restaurant, giving my earnings to my grandparents, for they cared for my wants and gave me what little school training I had. My parents were dead. In my 20th year I taught a five months' district school, with the proceeds of which I began a course of study at Wilberforce University."

"My early life, until I was 6 years old, was spent on a large plantation. At that age, father having secured a little home of his own, consisting of 3 acres of land and a log house, I with the family was carried thither. At the age of 10 I entered my first school, where I learned to read and write. The school was a Presbyterian school. During the summer I worked on a farm which father rented. At the age of 12 we moved to Lexington, N. C. I still attended school in winter and worked in a brickyard in summer. At the age of 14 my school days stopped until I was 19 years old. I did hotel work during the intervening years, and taught a three months' country school. At the age of 19 I entered college."

"My early life was spent as most poor boys, at work. I have served in every capacity from a dinner boy to a clerk. Have clothed myself since I reached my 14th year, beginning with earning 25 cents a week, and in two years I commanded a salary of \$6 per week. At 18 I was head clerk for a produce firm that did a business of \$10,000 a year. This was at Nashville, Tenn."

"I was born on a farm near Chillicothe, Ohio, November 15, 1825. At the age of 4 years I was taken with my parents to Jackson County, where there was a community of colored people; they had settled in close proximity in order to educate their children, because they were debarred from attending the public schools with white children. I attended a select school until 14 years of age."

"My first school-teacher was Mr. Turner, who was the colored Congressman from Alabama. His school was destroyed by Kuklux while I was attending it. Next attended Freedman's Bureau school and Swayne school in Montgomery, Ala. I attended Storr's, in Atlanta, and taught school when 15 years old; entered Atlanta University in 1874. Taught school during vacations."

"Born in Yazoo County, Miss., 6 miles from Yazoo City. I was taught my letters by my father. He died in 1866, and left mother with nine children, six sons and three daughters, three younger than myself. Desiring her children to have educational advantages, mother removed to Vicksburg in December, 1866. Here I entered the United Presbyterian mission school. I attended five years, sometimes day school and sometimes night school, as circumstances permitted, being largely dependent upon myself for support. I often had to hire out to earn money with which to purchase books and clothes, but when I hired out in the day I attended school at night. I taught school 1871-72. Was paying and collecting teller in Vicksburg branch of the Freedman's Savings Bank 1873-1875. Taught school 1875-76. Entered preparatory department of Oberlin September, 1876; admitted to college 1879. Matriculated at Dennison University in 1880, graduating in 1884. Though a slave I always had love for books and craved learning, in which I was much stimulated by mother, who, though unable to render me any financial assistance, gave all moral and prayerful help."

"Father was in good circumstances, so my opportunities for advancement were as fair as those of the average colored boy. I attended the public school of my native town until 17 years of age, then I went to Straight University, New Orleans, La., graduating from the classical course in 1881. My home surroundings were favorable to success. I had an excellent father, who is still living; my mother, whose memory I can not too greatly reverence, has been dead for many years. Their teachings, example, and influence have molded my character. Whatever success I have had I owe to them."

*Women.*

"I was born on a farm in Ohio, and lived there until I was 16. My father died when I was 12 and I had to provide for myself. At the age of 16 I taught a country school and saved \$100. With this I went to Oberlin, and went through by teaching and working."

"I am an African Methodist preacher's daughter, and from my 10th until my 15th year we were continually traveling over the State. Finally we came to Atlanta, where I stayed till I finished school."

"Lived a short time in Virginia, some time in Ohio, but principally in Missouri. Attended public schools in Macon, Mo., until the age of 15, when I went to Lincoln Institute for one year and Oberlin for five years."

"Was born and schooled in Philadelphia during the dark days of slavery. Was intimately associated with the work of the 'underground railroad' and the anti-slavery society. I was sent to Oberlin in 1864."

"My early life was spent at my home at Shoreham, Vt., where I attended Newton Academy. In the fall of 1891 I entered Mr. Moody's school at Northfield, Mass., graduating as president of my class. I then entered Middlebury College, Vermont."

"My father was route agent between Norfolk and Lynchburg, Va. Both of my parents had some education and were careful to send their children to school. I started in the public schools at 7."

"I went to school at Monroe, Mich., until a female seminary was opened there from which colored children were barred. I then went to Oberlin."

"My father was a creole and my mother a free negro woman. We moved from Mobile, Ala., to Wilberforce, Ohio, where I was reared. My parents were devoted Christians and were blessed with the comforts of life. My father had a fine collection of books."

"At a very early age I assumed the responsibility of housekeeper, as my mother died and I was the oldest of a family of five; hence I labored under many disadvantages in attending school, but nevertheless I performed my household duties, persevered with my studies, and now I feel that I have been rewarded."

"My mother and I 'took in' washing for our support and to enable me to get an education. After finishing the public schools of Jacksonville, Ill., I was supported four years in college by a scholarship."

"My early life was spent in Darlington, S. C. I did not attend the public school until I was a large girl, but was taught at home, first by my mother, then by a private teacher. When the public school was graded, in 1889, I entered the high-school course."

"While a schoolgirl I taught persons living out in service, going into the premises of some of the most prominent white people in New Orleans. I always kept a large class of night pupils at the same time. I paid my tuition out of these earnings."

## OCCUPATIONS.

The most interesting question, and in many respects the crucial question to be asked concerning college-bred negroes is: Do they earn a living? It has been intimated more than once that the higher training of negroes has resulted in sending into the world of work men who can find nothing to do suitable to their talents. Now and then there comes a rumor of a colored college man working at menial service, etc. Fortunately the returns as to occupations of college-bred negroes are quite full—nearly 60 per cent of the total number of graduates.

This enables us to reach fairly probable conclusions as to the occupations of college-bred negroes. Of 1,312 persons reporting there were:

	Per cent.
Teachers .....	53.4
Clergymen .....	16.8
Physicians, etc. ....	6.3
Students .....	5.6
Lawyers .....	4.7
In Government service .....	4
In business .....	3.6
Farmers and artisans .....	2.7
Editors, secretaries and clerks .....	2.4
Miscellaneous .....	.5

Over half are teachers, a sixth are preachers, another sixth are students and professional men; over 6 per cent are farmers, artisans, and merchants, and 4 per cent are in Government service.

These figures illustrate vividly the function of the college-bred negro. He is, as he ought to be, the group leader, the man who sets the ideals of the community where he lives, directs its thought, and heads its social movements. It need hardly be argued that the negro people need social leadership more than most groups. They have no traditions to fall back upon, no long-established customs, no strong family ties, no well-defined social classes. All these things must be slowly and painfully evolved. The preacher was even before the war the group leader of the negroes, and the church their greatest social institution.<sup>a</sup> Naturally this preacher was ignorant and often immoral, and the problem of replacing the older type by better educated men has been a difficult one. Both by direct work and by indirect influence on other preachers and on congregations the college-bred preacher has an opportunity for reformatory work and moral inspiration the value of which can not be overestimated. The report of the Atlanta conference on "Some efforts of American negroes for their own social betterment" shows the character of some of this work.

It has, however, been in the furnishing of teachers that the negro college has found its peculiar function. Few persons realize how vast a work, how mighty a revolution has been thus accomplished. To furnish five millions and more of ignorant people with teachers of their own race and blood in one generation was not only a very difficult undertaking but a very important one, in that it placed before the eyes of almost every negro child an attainable ideal. It brought the masses of the blacks in contact with modern civilization, made black men the leaders of their communities and trainers of the new generation. In this work college-bred negroes were first teachers and then teachers of teachers. And here it is that the broad culture of college work has been of peculiar value. Knowledge of life and its wider meaning has been the point of the negro's deepest ignorance, and the sending out of teachers whose training has not been merely for bread-winning, but also for human culture, has been of inestimable value in the training of these men.

In earlier years the two occupations of preacher and teacher were practically the only ones open to the black college graduate. Of later years a larger diversity of life among his people has opened new avenues of employment. The following statistics of occupations according to the year of graduation illustrate this partially:

Occupation.	Before 1870.	1870-1879.	1880-1884.	1885-1889.	1890-1894.	1895-1898.	Total.
Teachers.....	10	65	74	159	179	214	701

Hotel work.....						1	1
Carpenter.....						1	1

A study of present and previous occupation gives a still deeper insight into the problem of work. For instance, the following number of persons have never had but one occupation; they began as teachers and are still teaching, or as preachers and are still preaching:

<sup>a</sup> Cf. The New World, December, 1900, article on "Religion of American negro."

*Persons who have never changed occupation.*

Teachers .....	315	Editors .....	3
Clergymen .....	106	Artisans .....	3
Lawyers .....	26	United States civil service .....	3
Physicians .....	24	Clerks and secretaries .....	3
Students .....	15	Dentists .....	2
Farmers .....	7	Hotel work .....	1
In business .....	7		

Let us now add to these such persons as have changed occupations once. In the following table the period of study necessary in preparing for a profession is not considered a different occupation.

*Previous and present occupations of persons who have had but two successive occupations. (Showing also persons who have had but one occupation.)*

Present occupation.	Previous occupation.							Physi- cians.
	Teach- ers.	Clergy- men.	Stu- dents.	Farm- ers.	Clerks and secret- aries.	In busi- ness.	United States civil serv- ice.

Did not change .....	26	3		2	3		1	515
Total .....	33	6	1	2	6	1	7	702

Many interesting things may be noted in the above table. For instance, 43 lawyers report; of these, 26 started on a law course immediately after graduation, finished it, went to practicing, and are still engaged in that work; 11 taught before reading law, 2 were in business, and 4 in other employments, from which

they turned to law. There are reservations to be made, of course, in interpreting these figures; some persons report a few months of teaching as a "previous occupation," while others ignore it; some have not changed occupations, because being young graduates they have not given their present vocation a sufficient trial. Nevertheless, with care in using, the table has much to teach. We find that the profession of teaching is a stepping stone to other work; 87 persons were at first teachers and then changed, 11 becoming lawyers, 7 going into business, 26 entering the ministry, 12 entering the United States civil service, etc. Seven have at various times engaged in menial work, usually as porters, waiters, and the like, but all but one man working in a hotel have done this only temporarily. It is quite possible that others who are engaged in such work have on this account sent in no reports. We see in this way that of 700 college-bred men over 500 have immediately on graduation found work at which they are still employed. Less than 200 have turned from a first occupation to a second before finding apparently permanent employment.

Making all allowances for the gaps in these statistics and some bias on the part of those reporting, it seems fair to conclude that the majority of college-bred men find work quickly, make few changes, and stick to their undertakings. That there are many exceptions to this rule is probable, but the testimony of observers, together with these figures, makes the above statement approximately true.

#### GRADUATES OF A SINGLE TYPICAL COLLEGE.

It might be well here to turn from the more general figures to the graduates of a single representative institution. A graduate of Dartmouth College who has been in the work of educating negro youth for over thirty years writes as follows in a small publication which gives the record of Atlanta University graduates, including the class of 1899:

"This leaflet covers an experience of about a quarter of a century of graduating classes. It will tell of the work of only the graduates of Atlanta University, all of whom have been kept under the watchful eye of their alma mater. It would be difficult to trace the careers of the thousands of others who did not graduate but who have attended the institution for a longer or shorter period, although many of them are known to have made good use of their meager attainments and some are occupying prominent positions. If it were asked why no larger percentage of the students have obtained diplomas or certificates of graduation a sufficient answer would be found in the one word, 'poverty.' Their parents have been too poor to spare them from home or to pay their expenses at school and they themselves have been utterly unable to find any employment sufficiently remunerative to permit them to keep on and graduate within a reasonable limit in time. Probably the world can not show instances of greater sacrifices by parents or greater pluck, persistency, and self-denial of students than are to be found among the patrons and pupils of Atlanta University.

"While the 94 graduates from the college department represent only a small portion of the work done by the university, they represent a very important part of that work, as will be evident from a statement of the positions they occupy and the work they are doing.

"Of these 94 graduates 12 have died, and it seems to the writer of this leaflet as rather remarkable that only 1 has died during the four years since a similar leaflet was written. Of the 82 now living 11 are ministers, 4 are physicians, 2 are lawyers, 1 is a dentist, 43 are teachers, 1 is a theological student, 1 is studying at Harvard University and another at the University of Pennsylvania, 10 are in the service of the United States, 6 in other kinds of business, and 2 are unemployed.

"Three of the ministers are pastors of Congregational churches in the cities of Chattanooga, Tenn.; Selma, Ala.; and Savannah, Ga.; two are pastors of Baptist churches in Augusta, Ga., and Charleston, S. C.; two of Methodist churches in Griffin, Ga., and Portsmouth, Va.; one is chaplain of the Tuskegee Normal and Industrial Institute and dean of its Bible school; another is secretary of the International Sunday School Convention; another is the general secretary of the Baptist negro churches in Georgia, and another is presiding elder of the African Methodist Episcopal churches in Sierra Leone, Africa. All the churches named are centers of great power and wide influence. Some of these ministers have made addresses in national and international assemblages, one is a fellow of the Royal Geographical Society, and one has had the unique pleasure of being a member of the board of education in a large Southern city for eleven successive years.

"Many of the teachers are holding high positions. Eleven are principals of

public schools and three of high schools. Others are designated as follows: Professor of Latin and Greek in Clark University, Atlanta, Ga.; teacher of music in Savannah, Ga.; president of the State Industrial College of Georgia; principal of Howard Normal School, Cuthbert, Ga.; principal of Normal School, Oakland, Tex.; professor of Greek in Morris Brown College, Atlanta, Ga.; vice-principal of Normal School, Prairie View, Tex.; principal of Knox Institute, Athens, Ga.; superintendent of the industrial department in Biddle University, Charlotte, N. C.; professor of modern languages, history, and pedagogy, and vice-president in Lincoln Institute, Jefferson City, Mo.; president of the Florida Baptist College, Jacksonville, Fla.; professor of natural science in the State Normal School, Frankfort, Ky.; principal of the Georgia Normal and Industrial Institute, Greensboro, Ga.; principal of Walker Institute, Augusta, Ga.; superintendent of mechanical department of Knox Institute, Athens, Ga.; teacher of science in the J. K. Brick Normal and Agricultural School, Enfield, N. C.; assistant superintendent of the mechanical department in Tougaloo University, Tougaloo, Miss.

"The four physicians are located in Denver, Colo.; St. Joseph, Mo.; Savannah, Ga., and Chicago, Ill. All of them were among the very first in their classes in the medical schools that they attended.

"The two lawyers are practicing severally in Boston, Mass., and Augusta, Ga., and are successful in their profession. One is a master in chancery by appointment of the governor of his State. The one dentist lives in Atlanta and has an extensive practice.

"One of these graduates was a lieutenant in the Army during the Spanish war and is now a captain of United States Volunteers, serving at Manila. Another was paymaster with the rank of major.

"Several of the graduates who are clerks in the United States service in Washington have taken a full course in law or medicine. And when it is considered that this has required several hours of hard work in the evening after a full day at the office, for months and years, one can understand that they have grit and perseverance. Then three at least have been mail agents on railroads under four successive administrations, and have successfully passed the severe examinations required and conquered the violent opposition that has arisen against them from various sources.

"The peculiar conditions existing in the South have prevented these graduates from becoming prominent in political affairs. Yet one of them has been a member of three successive national Republican conventions and another has represented his county in the Georgia legislature, while a third has served two terms in the Texas legislature, being elected by the aid of the votes of Southern white men in a predominantly white community. \* \* \* His most conspicuous service has been rendered to the negro farmers of his State. This has been done through the organization of a farmers' improvement society with many branches, whose members are pledged to become landowners, to diversify their crops, to improve and beautify their homes, to fight the credit system by buying only for cash on a cooperative plan, and to raise their own supplies so far as possible. The fact that he can report to-day 86 branches of his society scattered over the State of Texas with 2,340 members, who have bought and largely paid for 46,000 acres of land, worth nearly half a million dollars, is a valuable illustration of what one negro with high ideals and an earnest purpose can accomplish for the economic and material advancement of his race.

"Several graduates have done considerable newspaper work, and many sermons and addresses delivered by them have been published. At least two publications have been highly commended by the press. Of President Richard R. Wright's Historical Sketch of Negro Education in Georgia the Journal of Education says: 'And it is just this that makes his story so valuable and forces one to read it straight through from beginning to end, which is not the way books and pamphlets are usually read in newspaper offices.' And of Prof. William H. Crogman's Talks for the Times the New York Independent says: 'The author speaks for his race and speaks in strong, polished English, full of nerve and rich in the music of good English prose.'

"And these graduates are not fickle and unstable, but retain their positions year after year, doing faithful, earnest, and patient service. The length of the pastorates of the ministers has been far above the average, and one of the teachers is completing his twenty-fourth year in the same institution.

"Do not these simple statements impress their own lessons? Should they not help to silence the sneers against Latin and Greek and higher education for negroes? Could less than a college course have fitted most of these men and women so well for the responsible positions they are occupying and the work they

are doing as pastors, professors, principals, physicians, editors, teachers, Sunday school superintendents, home builders, and leaders of their people? If half of them had failed to fill the place for which their education ought to have prepared them, even then their teachers and friends would not have been disheartened. But almost none have failed to meet reasonable expectations. This record of the college graduates is full of encouragement and inspiration."

#### THE WORK OF TEACHERS.

A glance at the work done by negro college graduates in different fields can be but casual, and yet of some value. The teachers we asked to estimate roughly the pupils they had taught. Some answered frankly that they could not, while others made a statement, which they said was simply a careful guess. From these estimates, we find that 550 teachers reporting think they have taught about 300,000 children in primary grades and 200,000 in secondary grades. From this we get some faint idea of the enormous influence of these 700 teachers and the many other college men who have taught for longer or shorter periods.

#### OTHER PROFESSIONS.

Outside the work of teachers, the chief professions followed are the ministry, law, and medicine. In most cases a regular professional course is pursued after the college course is finished, in order to prepare for the profession. The chief theological schools are Biddle, at Charlotte, N. C.; Howard, at Washington, D. C.; Gammon, at Atlanta, Ga.; Straight, at New Orleans, La.; Payne, at Wilberforce, Ohio; Lincoln, in Pennsylvania, and Union, at Richmond, Va. These institutions and others have turned out large numbers of ministers, until the supply to-day is rather more than the demand, and the number of the students is falling off. The work of replacing the ordinary negro preachers by college-bred men will go on slowly, but it will require many years and much advance in other lines before this work is finished. Some colored men have gone to Northern theological schools, usually to the Hartford Theological School, Newton Seminary, and Yale University. The leading negro ministers to-day are not usually college-bred men: still a large number of the rising ministers are such, and the influence of the younger set is widespread.

There are comparatively few negro law schools, those at Shaw University and Howard being practically the only ones. There has been a good deal of contempt thrown on the negro lawyer, and he has been regarded as superfluous. Without doubt to-day lawyers are not demanded as much as merchants and artisans, and they have often degenerated into ward politicians of the most annoying type. At the same time there has been a demand for negro lawyers of the better type. The negroes are ignorant of the forms of law, careless of little matters of procedure, and have lost thousands of dollars of hard-earned property by not consulting lawyers. In criminal cases in the South, where public opinion would support and protect in many cases the innocent but unfortunate white, it would allow the negro to go to the corrupting influence of the chain gang. Such practice a white lawyer would not care to follow, because of the prejudice of his clients. Where public opinion sets strongly against a negro suspect, it is very difficult to get a white lawyer to make more than a perfunctory defense, even if convinced of the man's innocence. His standing in the community would be seriously jeopardized if he showed too much zeal. There is, therefore, a distinct place for the black lawyer, but one hard to fill, with small and uncertain income in most cases. Here and there are exceptions, especially in the North. In Boston, for instance, there are four or five colored lawyers who make fair incomes, largely from white practice—foreigners, Jews, Italians, and some few Americans. In Chicago there are two or three colored lawyers with large incomes, and a host who make a living.

Some of the reports from lawyers are of interest:

A Memphis lawyer who has practiced for twenty-five years says: "I can not complain of the treatment I have received at the hands of both bench and bar."

A lawyer of Vicksburg, Miss., says: "There are two colored lawyers here in bar of about fifty. I do not enjoy any considerable white practice, but get my share from my race."

A Kentucky lawyer writes: "In my profession I am succeeding fairly well. My experience with the whites in all sections is that the white man looks upon himself as white and you as black."

A South Carolina man says: "As a rule white lawyers appear friendly; some will associate in cases with colored lawyers. The country white, however, who

sits on the jury is usually ignorant and prejudiced. When the jury is intelligent the chances are better. I am doing fairly well."

A very successful Tennessee lawyer reports his collections in 1899 as amounting to over \$4,000.

A Nashville lawyer writes: "I know of no special success attending my practice. I am making a living out of it."

A North Carolina practitioner says: "I handle real estate for both white and colored. I have a paying practice in all State courts. My clients are all colored."

From the North the character of the replies differs somewhat. "My practice is largely amongst the whites," says a Minnesota lawyer. From Chicago come several reports: "As a lawyer of six years' practice here, I have no reason to complain. My clients are about evenly divided between the two races." "In my practice as a lawyer for the past seven years I have done general law practice. Nine-tenths of my patronage from point of emolument has been and is from white clientele. I do considerable business for Irish people, a few Germans, many Poles and Bohemians, and many of English descent." "My clients are nearly all white. When people here want a lawyer, they want a man that can do their work, and they don't consider the color of his skin."

From Buffalo, N. Y., a lawyer writes: "My practice has not yet assumed proportions sufficiently extensive or varied to warrant me in making deductions upon present success. I can see no reason, however, why a colored man of high character and the requisite qualifications should not succeed in the practice of law. Of the white man's skeptical attitude toward the professional negro's ability and training one has frequent experiences at once amusing and disgusting."

Another writes: "My experience as a lawyer in Buffalo has been pleasant, and in my intercourse with the lawyers, almost exclusively white, I have had no cause for complaint, being apparently respected by bench and bar. I have been successful in winning cases, but have had less success in collecting fees."

A Minnesota lawyer, graduated in law in 1894: "Was appointed clerk of criminal court, and resigned December 21, 1898, to serve as a member of the Minnesota house of representatives. Am still a member, and have been practicing law. The district I represent—the Forty-second—is an entirely white district. I led the Republican ticket by 690 votes."

A Cleveland, Ohio, lawyer says: "My practice is increasing."

An Omaha, Neb., lawyer says: "My practice has been mixed both as to kind of cases and classes of people."

A Boston lawyer, who is common councilman of Cambridge from a white ward, reports "fair success."

Another Boston lawyer has been alderman of Cambridge for several years.

A Philadelphia lawyer says: "My practice is largely confined to Jews. The better class of negroes is not so likely to patronize me as the whites are."

The chief negro medical schools are Meharry, at Nashville, Tenn.; Leonard, at Raleigh, N. C.; Howard, at Washington, D. C.; Knoxville, at Knoxville, Tenn., and New Orleans, at New Orleans, La. These institutions have done remarkable work in sending out colored physicians. Their standard is lower than the great Northern schools, but in most cases the work seems honestly done and the graduates successful. Negroes have also graduated at the Harvard Medical School, the Medical School of the University of Pennsylvania, and other Northern institutions. The rise of the negro physician has been sudden and significant. Ten years ago few negro families thought of employing a negro as a physician. To-day few employ any other kind. By pluck and desert black men have cleared here a large field of usefulness. Moreover, in this profession far more than in the ministry and in the law the professional standard has been kept high. The college-bred physician has had quacks and root doctors to contend with, but to no such extent did they hold and dominate the field as was the case in the churches and criminal courts. The result is to-day that there is scarcely a sizable city in the United States where it is not possible to secure the services of a well-trained negro physician of skill and experience. The Freedmen's Hospital, of Washington, has made an extremely good record in the difficult operations performed, general efficiency, and training of nurses. Hospitals have grown up in various cities under colored medical men, notably in Chicago, Charleston, and Philadelphia. There are State medical associations in Georgia, South Carolina, Tennessee, and several other States.

The testimony of physicians themselves is usually hopeful. From the North a report from Newark, N. J., says: "I am and have been medical representative on our grand jury. Two-thirds of my practice is among whites. I run a drug store in connection with my practice."

From New York City: "At first I found the whites very backward in dealing with me, but success in several emergency cases gave me some reputation. Now my practice is about equally divided among black and white."

Another from New York City says his practice amounts to about \$10,000 a year, and he actually collects about half of that. About a third of his patients are white.

From Philadelphia one reports a large practice, chiefly among blacks and in the colored hospital. One colored physician is connected with a large white hospital. A lady physician from the same city reports "marked courtesy and respect on the part of all."

From the West a Chicago physician says: "I have been quite successful in the short time I have been practicing. About one-half of my patients are white."

Another Chicago physician represented the State of Illinois at the Association of Military Surgeons of the United States.

From Minnesota one writes: "I am succeeding in the practice of medicine in a city whose negro population is very small."

From Denver it is reported that a negro was the first chief medical inspector of the Denver health office, and he was also State sanitary officer. He has a large practice.

From the border States a Tennessee doctor reports: "I have succeeded in building up a good practice here among my own people. No missionary ever had a better field for useful labor."

A man who ranked his class at the Harvard Medical School reports a practice between \$3,000 and \$4,000 a year. "I am fully successful as a practitioner and surgeon, and I believe I enjoy the confidence of a large number of people."

From Missouri a report says: "I meet with most of the best white physicians in consultation, and they treat me with courtesy."

From Kentucky a young physician reports: "I am located in a town of 12,000 inhabitants, one-third of whom are colored, and am thoroughly convinced that there is a great field here in the South for the educated young colored man. As a physician I am well received by my white professional brother. We ride in the same buggy, consult together, and read each other's books. I have a few white patients, but most of them are colored. I have purchased property on one of our best residence streets, and also a business house on the main street of our town."

A report from Baltimore, Md., reads: "As a physician I find my practice a paying one."

From the heart of the South come many interesting reports. A North Carolina man says: "I have a fair practice for the length of time I have been at work. My intercourse with the white members of my profession is cordial along professional lines. I seek no others."

Another North Carolina physician "has treated more than 40,000 patients with reasonable success." He is now conducting a sanitarium for consumptives.

A colored man of Savannah, Ga., has been one of the city physicians for more than five years. "I have treated no less than 25,000 patients, including several hundred whites."

A Columbia, S. C., practitioner is often "called upon by white physicians to consult with them in medical cases and assist in surgical cases in their practice. I have an extensive and paying practice among my own people and a considerable practice among the poorer classes of the white people."

Another North Carolina physician has been usually invited to attend the white State medical society meetings.

On the other hand an Arkansas doctor says: "I have experienced some prejudice among my white friends. We do not have much to do with each other as physicians."

Still another Arkansas man reports that he "has had a half interest in some of the real major surgical operations done in this city. I have a large field and am often called to see patients at a distance of 20 and 30 miles."

In Macon, Miss., an unusually successful doctor says: "My practice here is very large and among both colored and white. Before I settled here no one had heard of a 'colored doctor.' The history of my parents, who had always lived here, helped to establish me. I have had white people come here from a distance and board here to get my treatment."

No thoughtful man can deny that the work of negro professional men as thus indicated has been, and still is, of immense advantage in the social uplift of the negro. There have of course been numerous failures, and there has been a tendency to oversupply the demand for ministers and lawyers. This is natural and is

not a racial peculiarity, nor indeed is it chargeable to the higher education of the negro. It was the natural and inevitable rebound of a race of menials granted now for the first time some freedom of economic choice. In the ministry this natural attraction was made doubly strong by the social prominence of the negro church, and by the undue ease with which theological students can get their training all over the land. Nevertheless, granting all the evils arising from some overcrowding of the professions, the good accomplished by well-trained ministers, business-like lawyers, and skilled physicians, has far outbalanced it.

#### OWNERSHIP OF PROPERTY.

It is very difficult to collect reliable statistics of property which are not based on actual records. It was not advisable, therefore, to ask those to whom reports were sent the amount of property they were worth, for with the best of motives on the part of those answering the resulting figures would be largely estimates and personal opinion. One kind of property, however, is least of all liable to be unknown to persons or to be exaggerated in honest reports, and that is real estate. Each college-bred negro was asked, therefore, to state the assessed value of the real estate owned by him. The following table was the result of 557 answers:

*Assessed value of real estate.*

	Number.	Actual amount.		Number.	Actual amount.
Under \$100.....	3	\$150.50	\$5,000 to \$6,000.....	36	\$182,273.00
\$100 to \$200.....	3	410.00	\$6,000 to \$7,000.....	13	75,540.00
\$200 to \$300.....	13	2,035.00	\$7,000 to \$8,000.....	7	56,500.00
\$300 to \$400.....	10	4,810.00	\$8,000 to \$10,000.....	9	79,375.00
\$400 to \$500.....	5	1,625.00	\$10,000 to \$15,000.....	17	161,000.00
\$500 to \$750.....	58	31,400.00	\$15,000 to \$20,000.....	5	71,550.00
\$750 to \$1,000.....	28	23,375.00	\$20,000 to \$25,000.....	1	21,700.00
\$1,000 to \$2,000.....	129	162,230.00	Own no real estate.....	85	-----
\$2,000 to \$3,000.....	73	158,440.00			
\$3,000 to \$4,000.....	42	239,887.00	Total.....	557	1,842,862.50
\$4,000 to \$65,000.....	18	82,600.00	Average per individual.....		2,411.00

With regard to the 85 who are tabulated as owning no real estate, it is not certain that in all cases this is a fact, or that some of them may not have had property which they did not wish to report. There is no way of knowing, of course, how far these 557 persons are representative of the 2,331 negro graduates. All things considered, however, this is probably an understatement of the property held; for while many of those not reporting held no property, yet most of those who did report represent the more recent graduates, who have just begun to accumulate, while numbers of the other graduates with considerable property could not be reached. Some who are known to own property did not report it. It is therefore a conservative statement to say that college-bred negroes in the United States own on an average \$2,400 worth of real estate, assessed value. If the assessed value is two-thirds of the real value in most cases, this represents \$3,600 worth of property, market value. To this must be added the worth of all personal property, so that the average accumulations of this class may average \$5,000 each, or \$10,000,000 for the group. Such figures are, of course, mere estimates, but in the light of the testimony they are plausible.

#### THE FUTURE OF THE NEGRO.

Among the most interesting of the answers received were those given to the questions: "Are you hopeful for the future of the negro in this country?" "Have you any suggestions?" Of 733 answers received, 641 were hopeful, 40 were doubtful, and 52 were not hopeful. Two hundred and seventy-six persons simply answered "Hopeful."

Others who were hopeful made the following suggestions as to the best methods and ways of advance: One hundred and twenty-five, "College and industrial training;" 49, "Accumulate land and wealth;" 47, "Better trained leaders;" 34, "More unity among ourselves;" 28, "The way seems dark;" 17, "A more friendly feeling between the races;" 11, "Parents and women hold the keys to success;" 10, "America is our home: stay here and work out the problem;" 8, "Better sexual morals;" 8, "Keep out of politics;" 7, "Eventually some must emigrate;" 6,

"Learn economy;" 4, "The negro will never rule, but will gradually gain his rights;" 1, "Emigration talk should be stopped."

Of persons who said simply "Not hopeful" there were 49. Others who were not hopeful or doubtful said: Nine, "They must migrate;" 6, "Fight for morals, industry, and higher education;" 5, "Little chance for the masses; Certain individuals will survive;" 4, "Do not accumulate means;" 3, "The industrial craze must be stopped;" 2, "Prejudice has gone to the North;" 2, "He must enter the commercial world;" 1, "Tendencies of the youth to crime."

The different points of view can best be appreciated by reading the following extracts:

"I am hopeful of the negro. The changes in a rapidly developing country like ours will afford many opportunities for the advancement of the negro; let him acquire the keenness of vision to see them and have the good sense to embrace them; let him seize every opportunity to put any community or the country at large under obligations to him for some manly service, regardless of how he is treated now. These obligations will be paid, if not in this, in the next generation. Problems will do good. Every theory presented by his opponents can be shattered by facts, facts, facts. There is no way in the world to deprive him long of a vote. It is very dark for him now. I think ignorance is making it harder for him than it would otherwise be. Not simply a want of knowledge of letters, but a general deficiency in everything necessary for well-being."

"Yes, but it is only in proportion as the negro is socially, commercially, and politically oppressed by the white people. In other words, under existing circumstances, I count oppression a blessing."

"Sometimes I am hopeful, sometimes I am not. In this part of the country negroes do not seem to embrace opportunities. Too much talent is wasted in politics and in office holding."

"I have always heretofore lived North and have not known the real condition of my people South. While I think I may say I am hopeful, yet as I see the conditions here I sometimes think that it is the progress rather than our lack of progress that is causing the continued friction between the races."

"While I am hopeful of the future of the negro in this country, I realize that he is now passing through the most crucial period of his existence here, if we except his condition in slavery. The sympathy of the North is being largely withdrawn from him and the South I believe to be growing more antagonistic to his progress and self-respect as a citizen. I would suggest a college education for the few exceptionally bright and industrial training for the majority of the negro youths."

"His future depends upon his own self-respect and thrift."

"Despite hindrances, too many opportunities are opened and opening for us for it to be possible to despair. The work of schoolhouses and churches, of such organizations as you represent, means a brighter day. The greatest need of our people, as I can see it, is parents. We need, need sadly, fathers and mothers who realize the full importance of the training of the children sent to them. Every home that has a cultivated, womanly mother and a manly, intelligent father is a source of strength and power. God grant that such homes may increase."

"This country offers the negro the brightest future of any in the world. He will and must succeed."

"Present oppression, suppression, and misrepresentation must give place to a sentiment of fairness and fair play. We must expedite its coming by developing a ministry that will study and comprehend the moral needs of the race and teach accordingly. Parents must be awakened to a sense of their duty as parents—the trend of the youth toward the vices must be checked. I am not in sympathy with those who say that the negro should eschew politics to the extent of neglecting to exercise his franchise."

"The negro must know that he must rid himself of obnoxious characteristics, save money, acquire property, learn trades, and become moral. The leading men among us must have sense enough to denounce the rapist as well as the lynchers."

"Guard well the sanctity of the home. Make a home, beautify it, make it pure, protect it, defend it, die by it. If the youths of our race were sent out from pure, happy, well-regulated homes, half the battle would be fought to begin with."

"In spite of conditions, apparently inauspicious, I am sufficiently optimistic to be hopeful of the future of the American negro. I consider the ostracism—political, social, industrial, etc.—to which he is subjected to be a training school out of which he will emerge a united race and, as a necessary concomitant, invincible. The key to the situation is the fostering of the spirit of race pride and the formation of ideals necessary to be realized and possible of realization."

"I think the strong caste prejudice in certain sections will lessen as those sections become less provincial and more cosmopolitan."

"I find that the negro's ignorance, superstition, vice, and poverty do not disturb and unnerve his enemies so much as his rapid strides upward and onward."

"I would like to see a restricted ballot fairly applied; I believe the negro would be the greater gainer."

"I suggest that one-tenth of his external religious energy be applied to the accumulation of homes and desirable lands."

"The future of the negro depends upon his making himself felt as a race. Not by force, but by intelligence and wealth. Also, I would add that our colored lawyers have much to do, for through them we are to get our legal rights."

"When we look at the masses of our people and see on the one hand ignorance and on the other careless indifference, it is difficult to feel very hopeful for the future. We see so many of our young people who seem to have no thought of the future, no ideas beyond having a good time in the present, who seem able to have no enthusiasm over anything higher than a ball or like entertainment. They can not be brought to take interest in any measure that will benefit us as a people."

"Patience, character, time. I believe the negro will have to build up a government of his own somewhere."

"A good many of our young men and ladies, after they have gone to college, think that manual labor is not for them to do. When we get more real estate we can open stores and other places of business and employ the college-bred negro."

"Money, money, money, is what he needs."

"The negro should engage in business, have his own stores, dry goods, drugs, groceries, banks, his own professional men; and make morality and education the basis of worth."

"I would suggest that we accumulate more property, get homes, and that those who have homes invest their money in negro enterprises."

"I am very hopeful. All of the older races have risen and fallen; the white race is at its zenith and of necessity will fall and the negro take its place."

"I am indeed hopeful for our future, and not only in this country but here in the South. Daily I ride through thousands of acres of land owned by negroes in Mississippi. They are happy and prospering. Let us fear God, treat our white neighbor with courtesy, save money and educate our children, and the close of the twentieth century will find us a great and prosperous people."

"For the remote future I am hopeful; but a triumph which is to come only 'after the silence of the centuries' holds out little to those of the present age; and still there is some pleasure in planting trees for future generations."

"I have never seen any good or sensible reason to despair of the future of our people in this country, though I must admit the outlook at times is anything but hopeful. I can not escape the conclusion that it would have been better for the race in the long run had a Territory or Territories been set apart for it. His progress would certainly have been more apparent. As it now is he is overshadowed by the white race. The negro may eventually reach his best here and will doubtless, but it will be a long while yet."

"I am hopeful for individual members of the race, but for the race as a whole I am not. I am in favor of expatriation."

"I would suggest that our leading men do less talking on the negro question as such. Much talking means much concession, and much concession means less opportunity."

"More should turn their attention to business and fewer enter the professions of teaching or preaching."

"As a race, no; as individuals, yes. Class legislation, such as 'Jim Crow cars,' disfranchisement, and other kindred evils, is slowly undermining the manhood of the race. The negro begins to think that he is in all respects inferior to all other people."

"I believe that the wheels of progress never glide backward. How fast the advancement of the negro will be is left to his control. I believe in union of negroes—that they should stand together in all things, and that their inherent prejudice should be turned from each other and directed toward those who hate them."

"Suppress the so-called political leaders among us and send those who incite to deeds of violence to the Transvaal, and the period of right living and right thinking which must come will be hastened."

"Those of us who are getting out of the wilderness and mire of ignorance and degradation must help those who will not or can not help themselves."

"Why should I not be hopeful? The abandonment of the priesthood of a race has always been attended with disasters. Let the negro stick to his church in the service of God. Be honest, honorable, peaceable, make and save money, educate his children as highly as he can afford to, attend to his own business, and let white people settle their own quarrels."

"I suggest that religious and educational work should be done on the missionary plan in the lanes and quarters where the lowest and most vicious negroes live. Negro churches are not practical enough in their work. Religion is too often mistaken for piety. Our educated young people are too high above the masses to help them. Let them personally help in the moral uplift of the criminal classes, and especially their children. Industrial training should be advocated for the masses, but higher education should not be discouraged when the means and ability are sufficient.

"I believe that ultimately, just as the Pilgrim Fathers left England to escape persecution, so the negro will have to leave this country to escape color persecution. It is also necessary for him to leave this country to gain racial independence. As long as the negro is carried about in the lap of the superior race as an infant in 'swaddling clothes,' which he is, or as long as he permits any other people to assign to him a place he does not like, or which he has not carved out for himself, or which he is unable to maintain, so long will he continue to remain helpless and despised. There are plenty of countries in the Tropics where the thrifty negro may go, and where by patient and earnest toil he might lay the foundation of a government which would be free from color persecution and which would be attractive to future generations of American negroes."

"I am hopeful, though it is dark just now and the world seems to be against us. God is just and will lead us through the cloud in His time. The people should be urged to buy land, get homes, educate their children, save their money, live honestly, and stick together—that is, love our race better than any other."

"The abundance of ignorance and poverty among our people is the general hindrance."

"I would suggest that we be honest with ourselves, not try to lay the blame upon some one else; stop whining and try by individual effort and accomplishment to prove our claim and right to American citizenship."

"My suggestion is that he make good use of the opportunities at hand; develop that which is best in himself. Don't strive to be other people, but make himself the equal, and if possible the superior, of other people."

"When I look back to the point from which the negro started, the distance he has already come, and the achievements he has made through adverse circumstances, all this is to me but dim prophecy of future possibilities, and therefore I can see no reason for despair, though the night be dark and the storm rage."

"I have the most profound confidence in the future of the negro; but there is need, first, of a greater dissemination of knowledge among the masses; second, more attention given to real character building; third, facts creditable to the negro made known; fourth, falsehoods answered and publicly exposed; fifth, immoral and weakening habits rebuked, and Judases among negroes denounced."

"If the white people were more disposed to reason on the race question from the negro's standpoint, and the colored people were also more disposed to reason on the question from the white man's standpoint, there would be good ground for being more hopeful."

"I was hopeful until I went to Alabama."

"If the fullest glow of warmth and glare of light possible to American life would be afforded him he would come to the light and walk in the light, but with a flaming sword at every gate he can not progress. Without a radical and early change in the general judgment and treatment of the negro the first half of the twentieth century will place him in a position more inextricable and more hopeless than his enslavement."

"I am sorry to say that the future for the negro in this country looks very dark to me, and the more I come in contact with the masses of the people, especially our people, the more confirmed becomes my opinion."

"Am much afraid of the bad influence of so-called leaders who lack the moral stamina, and often have large influence with the masses. They work on their prejudice, and appeal to their instincts. In place of noisy 'leagues,' 'conventions,' and showy resolutions and talk, only talk, more solid, honest, modest work among us would wonderfully help. Our leadership is often superficial in character, sentimental, insincere. We are often discredited among better classes of other races because we fail to discriminate on lines of character."

"In a manner, yes. He is a sluggish, lazy creature, however, and must be driven either by necessity or some other master, or he will not accomplish much. They need competent leadership, especially in the pulpit, from which point most of them may be reached. Too many of their ministers are mercenary politicians entirely lacking in character."

"Very hopeful. The work lies mainly in the hands of teachers and ministers. They must insist upon neatness, cleanliness, good, orderly homes, refinement, quiet manners in all public places. Teach boys and girls to establish an ever-increasing bank account. Every family should have at least one good newspaper and family magazine."

"No, there is no future here for the negro but peonage. A few of the quadroons will lift themselves out of the slough of oppression and go to the English colonies. The mass will go lower and lower to the dead level of mere existence. The reasons for this are the terrible combination of odds against the negro and his own qualities."

"A few years ago I had great hope that the depressing conditions which existed then could not last long, but my hopes have about faded. The main reason for this is in the fact that prejudice against the colored man has spread from the South to the farthest point North."

"I am discouraged when I note, particularly in the South, the tendency of our young men to immorality, vice, and crime. The saloon and the dice are playing terrible havoc with the 'flower' of the race. I am more hopeful for the young women, as shown by the numbers that are being trained in schools and colleges."

"The negro can not be a great race in this country. Let the race learn all the trades and professions, and thus be prepared for separation, for separation must come some time."

"I am hopeful. I would suggest that the negro leaders, preachers, teachers, editors, etc., assemble and have a conservative understanding as to how we shall best reach and improve the condition of that class of negroes who are guilty of the crimes which are the alleged cause of the confusion in this country. That class of negroes who are guilty of confusing this country with heinous crimes is a class that never attend church and school, nor do they read a paper."

"I believe he can prosper here if he'll get an education, be honest, and accumulate property. I believe the future of the negro rests with the women. Every effort should be made by mothers and schools to raise their morals. I would advise young women not to take immoral men as their equals. Mothers should teach their daughters that it is better to be alone than in bad company."

"Our future looks dark to me. I think colonization out West or in the West Indies our only hope."

"There is no hope for the negro in America unless put to himself. As long as he is found with the white people so long will he be their servant. This is clearly seen every day. The prejudice is too great. Emigration is the only solution. Let him get to himself."

"The negro religion at the present time is a hissing and a reproach. Kipling says: 'When the negro gets religion he returns to the first instincts of his nature.' We are cartooned to the full extent of the law and many of these cartoons have much truth in them. Purify negro worship. Uncloud the negro's God and the church will be the true solvent of the difficulties of the race."

"I have hope, because we have a Bible. In a heathen country in the midst of like conditions I should utterly despair. The American conscience will some day respond to the Sermon on the Mount."

"This is the most favored spot on the globe for any man. I do not recognize any demands upon the negro different from those upon every other man of our conglomerate civilization and nationality. My suggestion is that we be ourselves to the very fullest and highest."

"To my mind the future of the negro in this country seems dark. Ten, fifteen, and twenty miles from the cities and towns in this State you will find the majority of our people practically slaves to the landlords. We need a true Moses to lead us away."

"I do not think that the negro will ever reach the height of his ambition in this country. I think we should have a territory to ourselves; somewhat like the Indians have."

"I am not very hopeful of the negro as a race. The only suggestion I would make is that those of us who have influence do something to stop this industrial craze. It is popular because many of the whites believe that the theory is to educate the negro to be a good servant. The average white man cares little for the negro as a man. If he is to be educated to take some inferior place the whole country applauds."

"It is a hard question. I fear the negro is degenerating. Our boys and men are for the most part lazy around our cities and towns, and the outlook so far as they are concerned is gloomy."

"I think that the physical vitality of the race has been and is still being lowered by immorality and the race stock permanently weakened."

"I am hopeful, but I fear I shall never live to see the better day which is assuredly coming. The present negro will have to suffer, sacrifice, work, and die for those who will come after us. I think we are too sycophantic. We do not agitate enough right here in the South, and we do not avail ourselves as we ought of the right of petition to redress our grievances."

"I write from Oklahoma. This place offers to my mind the best opportunity negroes have had in this country. The civilization is being built up now and negroes have a chance to be in the formation."

"I think the negro has a future in this country, but they must rise as individuals and not as a mass."

"I fear more from the negro's own misconduct toward himself than I do from the outrages of others. I am hopeful, however, of the negro's future."

"The negro can succeed in this country. One of the principal things against us is the boastful spirit in the negro. Let him throw away that spirit and take on one of kindness and obedience to law and order, putting forth every effort to accumulate money and to buy land and other of the earth's treasures, he will succeed beyond man's estimate."

"The negro in this country must learn to be a unit, to stop social strife, and, above all, to forbid the ignorant to attempt to rule those of their own race who are educated and are competent to fill positions of trust and honor on their merits and educational qualifications."

"Let each negro forge ahead regardless of proscription. Success must come to the man who works regardless of obstacles."

"I am hopeful, yet it will be necessary for us to open the eyes of our people to the fact that we are being supplanted by white men. White men are taking employment from us. What must be done? We must do something."

"His future is beclouded. He is drifting morally, and unless there be some speedy rescue his doom is sealed. The Bible asserts that: 'A man's greatest enemy is in his own house;' so my candid belief is that the negro is the greatest enemy of the negro. Confidence must be implanted, that organizations may be perfected for protection and successful enterprise."

"Can you offer a solution for the employment of the great loafing classes? These are the ones who cause the enormous death rate in our cities. These are the ones who commit the crimes chargeable to the negro race."

"Not through amalgamation nor deportation—often we console ourselves with such delusive hopes—but through much humiliation, many obstacles from within and without, much learning and labor, many tears and years to success."

"I am, provided he will acquire real estate; own something that somebody wants; separate and go into different political parties; stop clamoring for places; go make places and occupy them; economize along all lines."

"Yes, if they can be encouraged to buy farms, and not seek the cities and towns unless they have a profession. Give the negro a farm and a plenty to eat and he will care but little for the 'Jim Crow' car. Independence is the best way to keep from being oppressed."

"If we could get the negro to see his own condition, and then be willing to strive with all his might to improve even the few opportunities he has, I am sure he would soon come to the front."

"I must be hopeful of a race that has made in one generation the progress that we have, and that in competition with the most progressive people on earth."

"I think through industry, constancy, and self-respect the future of our race will be made secure. I am not in sympathy with any colonization schemes."

"The negro can never enjoy equal civil and equal political rights with the white man in this country except through centuries of wars and revolutions similar to those Rome, England, and France experienced in securing equal rights to their different classes of subjects."

"When we can get our women to see that the future success of the race depends on them: when they have a higher standard, when we have purer mothers, wives, and daughters, then we shall have better men; then will our race succeed."

"I hardly know what to say here. If it were intelligence which was demanded of the negro I would be hopeful. But I fear it is not that; the prevailing belief among the masses of the white people is that the negro is made for all lowly work in life, and wherever the negro differs from this belief there is ground for trouble."

"As to the future of my race I am an optimist. I believe that the salvation of the negro lies in the regenerated South."

"I entertain hopes, but I am not enthusiastic over them."

"I am hopeful, yet sometimes I doubt the wisdom of being so."

"I think the future of the race in this country is indeed uncertain."

"As a negro, 'no.' As an American citizen, growing important silently under persecution, individually catching the prosperity epidemic by contact until merit forces color in the background, 'yes.'"

"The chief occupation of the young negroes of this town seems to be as waiters, caterers, and the like. Outside of these menial lines I see but little prospect of any notable success among them, though if increased ideas of soberness and thrift could be made theirs, they might be a more respected and powerful portion of this community."

"I am sanguine. The negro must get in the van of every profession pursued by the Anglo-Saxon and stay there. Solid reason molded into general intelligence, sound morality, financial independence, and reverence for the Constitution and laws of our country is the basis upon which the race is destined to reach a pre-eminent place in American history."

"I am hopeful, though I regard the present condition in the South as alarming. I have serious apprehensions on account of the friendship between the North and South as a result of the war, and I have some fear lest the industrial theory of

education may be exaggerated or misconstrued and the race be put in the light of aspiring to nothing more than to be successful 'hewers of wood and drawers of water.'"

"If we are left to carve our own future, unhampered by negative laws and influences, I have hope in our own powers of development, but I fear the things that may discourage us."

"The fittest will survive; the public schools and the graveyard will ultimately bring things right."

"I am; but the difficulties seem to increase with progress. I am in favor of industrial education, but not to take the place of higher education."

"I am hopeful of the negro's future. Organized support should be given for the education of negroes of superior mental ability at the best universities in this country. The best among us must be fully developed and the worst truly saved."

"I am hopeful of our future. But inequality of wages and expenses is greatly hindering our progress in almost every way. Far more of our troubles are to be attributed to this than one would suppose."

"History shows that the negro of America is treated better than the peasants of the past were treated, though they were of the same race as were their masters."

"I have, and my hopes are based on the equality of the work that is being done in Fisk, Atlanta, Wilberforce, Central, Howard, Tuskegee, and like institutions. Surely the catalogues of higher instruction are sufficient to inspire hope when one sees the vast amount of work accomplished by their army of graduates. I suggest that each negro principal of public school should be the representative of some standard negro publication; should endeavor to create an interest in race literature. Each teacher should take at least a half hour each week talking of representative colored men and women and what they have accomplished; should teach race history in conjunction with United States history, from the battle of Lexington to the storming of San Juan Hill."

"It will require an age to cement the negroes together. Intelligence, virtue, industry will join education and work; all kinds of education, from kindergarten to the university, and all kinds of work, from the plow to the telescope. The young negro must be put to work in order to save virtue, keep out of crime, and lay the foundation for a mighty race."

"To the extent that he is willing to distill his life's blood into his chosen work, I am. Let him find out what he can do well, and do that thing with all his might. If in any case his legs fail him, let him learn to fight on his knees."

"Yes, and no. Materially and financially, yes. For us as a people who may hope to win an equal respect and consideration for our manhood from the dominant race, I am afraid the situation is hopeless."

"The fault is not in our stars, dear brothers, but in ourselves."

"We need better primary schools, more teaching force, and longer terms in the rural districts."

"The Northern negro, as I see him, lacks earnestness of purpose, is too easily satisfied. Lives too easy, does not appreciate the value of character, and too often does not know what it is. Lives too much in the present, thinks not of to-morrow."

"We should never forget that the world belongs to him who will take it."

"I am hopeful for the future of the negro to a certain extent. The masses in the rural districts must be looked after more than they are. Earnest, educated men and women must go among these people to live and work."

"I am sorry to say that the evidence of our hope is not as substantial as I would like it to be."

"The hope of the masses of the negroes will be, in my opinion, in industrial education."

"I regard the future of the negro in this country as assured. He will never encounter absolutely insurmountable barriers to his really essential progress. Men are ashamed to be quoted as opposing him in that direction. The wrongs done

him in the name of resisting his criminal tendency will operate only to spur him to better things, and those who interpose to hinder him here will suffer permanent moral deterioration and decay."

"While I favor industrial schools, there never was a time, in my opinion, when there was a greater need of college-bred negroes than there is to-day. There will never be too many. The road is too long and rough for too many ever to reach the end. Our race needs college-bred men just as badly as do the whites; in fact, we need them more."

"It does seem to me notwithstanding the criticisms from without and the constant complaining within that the race is progressing."

"I would suggest that each put forth effort to have a greater number of college-bred men and women. We need them as leaders. Our race has and is furnishing plenty of muscle, but we need more brain."

"The responsibility of this age is upon the negro to educate the white man out of his prejudice. It is our condition rather than color that is our great drawback. When we want a special car, put up the money and we get it. If we owned railroad stock we could help make the rules that govern the company. If we had the controlling amount of stock we could have our conductors."

"I am optimistic in spite of the lowering clouds. We have but recently burst from the storm and are not far enough away from it to become settled. I believe this to be the 'Sturm und Drang' period of the negro's existence. I am aware of the strong arguments against such a position, but in the light of the teaching of history there must be, there is, a turning point down near the gates of despair; where once the opposing currents are mastered brighter and better conditions must arise. A better understanding, and the practical application of the laws of chastity, morality, Christianity; an ever increasing acquisition of wealth and practical intelligence; the adoption of principles of courageous manhood; the wholesale banishment of buffoonery and instability; a closer study of those elements that have made the Anglo-Saxon great, and a strong pull, a long pull, and a pull individually and collectively toward the acquisition of the same traits, seem to me to be a few of the essential things that may possibly level our barriers."

"(a) In spite of the present disquieting conditions I am inclined to feel hopeful for the following reasons:

"1. The difficulties that now confront the negro will serve to awaken his dormant energies, and in proportion as he applies himself to master these difficulties will he be developing his manhood. I notice that where the negro is most oppressed there he is most prosperous. For this reason I have always held that the salvation of the race is to be worked out in the South.

"2. I feel in what the negro has achieved since emancipation the promise of what he will achieve in the future. His power and resources have increased considerably in these thirty-five years.

"3. I perceive in the negro elements of character which are his saving virtues. He is ambitious, irrepressible, patient, and possessed of marvelous powers of endurance. He aspires to be something else than what he is, and will strive for it. If he is kept back he will still look at the object, bide his time, and seize the opportunity when the chance invites.

"4. I believe that humanity, respect for law, and love of justice, which are such conspicuous qualities of the heart of the Anglo-Saxon—the dominant race of this country—will some day reach out and embrace the negro in America as it has his brother in Cuba and his cousin in the Philippine Islands.

"5. I have strong faith in the irresistible power of the Christian religion to bring those under its influence to accept the doctrine of the brotherhood of man and to live up to its obligations.

"(b) As the conditions of American life demand that the negro shall take an active part in bringing about a change for the better in his situation, there are some things which should engage his most earnest endeavor. I venture to suggest those that now occur to me:

"1. To try and make himself a necessity. Whatsoever his hands find to do he must do it so well that his services will be indispensable. And he should strive to be a producer as well as a consumer. In order to gain this position let him follow the example of his prosperous Anglo-Saxon brother, namely, of cultivating and applying the resources of his intellect. To this end an opportunity could be afforded by means of the university-extension system, adapted to the peculiar needs and circumstances of the race. The plan should provide for night schools, in which

professional men and women can, in their own communities, give their service freely or for a small remuneration.

"2. The practice of thrift and frugality.

"3. The establishing of real unity and cooperation of the race.

"4. The making the best use of the opportunities which are at hand."

#### IS THE COLLEGE TRAINING OF NEGROES NECESSARY?

A few opinions of prominent men in answer to this query are subjoined. They are partly in answer to a circular letter sent to a few college presidents:

I have never lived South, and my opinion on the question you ask is not very valuable. It is, in a word, this, that Mr. Warner's contention is right for most members of the race, but that the way should be kept as wide open as possible for gifted men like \* \* \* , Booker Washington, and many others to have every opportunity that any of the Northern or other colleges can afford.

I am, very truly, yours,

G. STANLEY HALL,

*President of Clark University.*

DECEMBER 10, 1900.

I believe not only in common-school and industrial education for the negroes of the South, but also in their higher education. The higher education is necessary to maintain the standards of the lower.

Yours, truly,

GEORGE E. MACLEAN,

*President of the State University of Iowa.*

DECEMBER 11, 1900.

I believe fully in the higher education of every man and woman whose character and ability is such as to make such training possible. There are relatively fewer of such persons among the negroes than among the Anglo-Saxons, but for all of these the higher training is just as necessary and just as effective as for anyone else.

For the great body of the negroes the industrial and moral training already so well given in certain schools seems to me to offer the greatest hope for the future.

Very truly, yours,

DAVID S. JORDAN,

*President of Leland Stanford Junior University.*

DECEMBER 14, 1900.

Your circular of December 8 comes duly to hand. In response I would say that in my judgment no race or color is entitled to monopolize the benefits of the higher education. If any race is entitled to be specially favored in this respect I should say it is the one that has by the agency of others been longest deprived thereof.

The above you are at liberty to present as my sentiments.

Yours, cordially,

WM. F. WARREN,

*President of Boston University.*

DECEMBER 13, 1900.

In reply to your request of December 5, I would say that it seems to me that the collegiate or higher education is not a special favor to be granted to men on the ground of race, family, or any such minor consideration. The only condition for the receiving of a college education should be the ability to appreciate and to use it. Human nature is substantially the same everywhere. It should be the glory of our country to afford to all her young men and women who crave the broadest culture and who have the spirit and ability to acquire it, the amplest opportunity for development. Looking at it more specifically, I can see that the general uplifting of our negro population requires a proper percentage of college-bred negro leaders.

Yours, sincerely,

GEORGE C. CHASE,

*President of Bates College.*

DECEMBER 17, 1900.

You ask for my opinion in regard to the desirableness of higher training for the negroes. Let me begin my statement by saying that I have the utmost faith in the management of the Atlanta University and several other institutions for the training of negroes in the South. I will, however, candidly say that in my judgment there are a great many of the negroes whom it is not worth while to guide through a course of university training. I think that is true also of the white race, but in the present condition it is peculiarly true with regard to colored people. My idea would be that all the training that the colored man is capable of thoroughly mastering should be given him, but that in the higher departments of learning, like political economy and history, the ancient classics and the natural sciences, only selected men should be given the fullest opportunities. I have the strongest confidence that such training as is given at Hampton and at Tuskegee, largely manual and industrial, is of the greatest importance for the negroes and is to be the means of fitting the race a generation or two hence to enter more fully into the more abstract and philosophical studies. I do not know that I have made myself perfectly clear, but in a general way I should say the multiplication of universities of the higher sort is not desirable in comparison with the multiplication of training schools for all the trades and manual activities.

With best wishes, very sincerely, yours,

FRANKLIN CARTER,  
*President of Williams College.*

DECEMBER 12, 1900.

---

Teachers and leaders need more than a common school education. This is as true of negroes as of whites.

Where shall they obtain a liberal education? With few exceptions, I think, it should be in the Southern colleges. The color line is so sharply drawn in Northern colleges (unfortunately) that a negro is at great disadvantage, not in studies, but socially. \* \* \*

Very truly, yours,

GEORGE HARRIS,  
*President of Amherst College.*

DECEMBER 12, 1900.

---

I believe in the Southern negro college and the higher education of negroes.  
\* \* \*

Very truly, yours,

JOSEPH SWAIN,  
*President University of Indiana.*

DECEMBER 10, 1900.

---

The problem is such a difficult one that I have been compelled largely to rely on the judgment of my friends. My opinions are chiefly taken from the experience of Mr. William F. Baldwin, now president of the Long Island Railroad, and are therefore hardly such as I ought to put in a form for quotation.

Sincerely, yours,

ARTHUR T. HADLEY  
*President of Yale University.*

DECEMBER 10, 1900.

---

I am, like many others, greatly interested in the question of education of the negroes. There seems to me to be a place for the college properly so called which shall teach a certain number, who may be leaders of their race in the South, as preachers and advanced teachers. At the same time, I have much sympathy with Mr. Booker T. Washington's idea, that a large proportion of them should be educated for industrial pursuits.

Yours, truly,

JAMES B. ANGELL,  
*President of the University of Michigan.*

DECEMBER 10, 1900.

---

How, then, are the teachers, the preachers, the physicians for the colored race of the South to be provided, unless the South has institutions of the higher education serving the negro, fitting him for these higher positions? We know very well that the negro, as he rises in the social scale, will live in better houses and

follow better trades, and, in general, be industrially and financially elevated; and we should not for a moment criticise the work which is going on throughout the South in several institutions which Boston interest and sympathy have furthered.

But there is another essential thing—namely, that the teachers, preachers, physicians, lawyers, engineers, and superior mechanics, the leaders of industry, throughout the negro communities of the South, should be trained in superior institutions. If any expect that the negro teachers of the South can be adequately educated in primary schools, or grammar schools, or industrial schools pure and simple, I can only say in reply that that is more than we can do at the North with the white race. The only way to have good primary schools and grammar schools in Massachusetts is to have high and normal schools and colleges in which the higher teachers are trained. It must be so throughout the South; the negro race need absolutely these higher facilities of education.—CHARLES W. ELIOT, *President of Harvard College* (in a speech at Trinity Church, Boston, February 23, 1896).

---

The higher education is the last thing that the individual pupil reaches; it is what he looks toward as the end. But from the point of view of the teachers, from the point of view of the educational system, the higher education is the very source and center and beginning of it all; and if this is wanting the whole must collapse. Take away the higher education, and you can not maintain the level of the lower; it degenerates, it becomes corrupt, and you get nothing but pretentiousness and superficiality as the residuum. In order to maintain the lower education which must be given to the South, you must have a few well-equipped institutions of higher learning.—WILLIAM D. HYDE, *President of Bowdoin College* (in a speech at Trinity Church, Boston, February 23, 1896).

---

It seems fair to assume from these and other letters that the conservative public opinion of the best classes in America is that there is a distinct place for the negro college designed to give higher training to the more gifted members of the race; that leaders thus trained are a great necessity in any community and in any group. On the other hand, there is considerable difference of opinion probably as to how large this "talented tenth" is—some speaking as though it were a negligible quantity, others as though it might be a very large and important body.

The opinions of some other persons ought perhaps to be added to the above. First, there is the almost unbroken line of testimony of the heads of negro colleges; this is, of course, interested testimony, and yet it is of some value as evidence. A man who left a chair in the University of Michigan to go South and teach negroes before the war ended wrote after twenty-five years' experience in college work:

"By this experiment certainly one thing has been settled—the ability of a goodly number of those of the colored race to receive what is called a liberal education. A person who denies that shows a lack of intelligence on the subject.

"But the possibility granted, the utility of this education is doubted both as to individual and race. First, then, as to the individual, aside from the mere mercantile advantage derived from education, does not the hunger of the negro mind for knowledge prove its right to know, its capacity show that it should be filled, its longing that it should be satisfied? And as to the race at large, does it not need within it men and women of education? How would it be with us of the white race if we had none such with us—no educated ministers, doctors, lawyers, teachers, professors, writers, thinkers? All the preaching to 8,000,000 of colored people in the United States is done by colored preachers, with the merest exceptions here and there. Do these negroes not need preparation for their vastly responsible calling?

"The entire work of instruction in the colored public schools of the South is done by colored teachers. These teachers can not be prepared in the white schools and colleges of the South. Where, then, shall they be prepared if not in special higher institutions of learning open to them? What is to become of the millions of colored people in the United States? Who are to be their leaders? Doubtless persons of their own race. Do they need less preparation for their calling than

do members of the white race for theirs? Is not their task even more difficult? Have they not questions of greater intricacy to solve? Did not Moses when leading ex-slaves out of Egypt need special wisdom? Are not the colored people of to-day 'perishing for lack of knowledge?'

"But the objector will say, Why have these long courses; these colleges for colored people? Would not shorter courses be as well, or even better? The following is my belief on this point, after twenty-five years of thought and experience: If the negro is equal to the white man in heredity and environment, he needs an equal chance in education; if he is superior, he can get on with less; if he is inferior, he needs more. The education required is not simply that of books, but of life in Christain homes, such as are supplied in nearly all our missionary schools for that people, and of religion through the Christain church and its influences."

The president of another negro college said in 1896:

"To imagine that the negro can safely do without any of the institutions or instrumentalities which were essential to our own advancement is to assume that the negro is superior to the white man in mental capacity. To deprive him of any of these advantages, which he is capable of using, would be to defraud ourselves, as a nation and a Christian church, of all the added power which his developed manhood should bring to us. It does not seem to be necessary in this audience to discuss the proposition that intelligence is power, and that the only road to intelligence is through mental discipline conducted under moral influences.

"What have we been doing for our brother in black to help him in his life struggle? The work began somewhat as in the days of our fathers. The John Harvards and the Elihu Yales of Pilgrim history found their counterparts in General Fish, Dr. Phillips, Seymour Straight, and Holbrook Chamberlain, who founded colleges even before it was possible for many to enter upon the college course, but with a wise forecast for the need that would eventually come and is now actually upon us."

These two extracts sufficiently represent the almost unanimous opinion of the presidents and teachers in negro colleges that this training is a success and a necessity.

Further testimony is at hand from the answers which college-bred negroes made to questions as to their present estimate of the value of their training. This testimony is, of course, apt to be distinctly one-sided—only a few peculiarly open natures being likely to acknowledge a failure in their own training. Nevertheless the answers received were so frank and varied that they should be studied:

#### HAS YOUR COLLEGE TRAINING BENEFITED YOU?

Yes .....	412
It was a great benefit .....	34
The largest possible benefit .....	6
It was certainly a benefit .....	23
My college training has fitted me for life .....	17
A wonderful help .....	21
It has been of incalculable value .....	7
Immeasurable .....	18
It has been of infinite value .....	8
It was indispensable .....	20
The college made me .....	9
I owe my success to it .....	6
Too difficult to answer .....	1
No other would have been serviceable .....	11
Could not pursue my present course without it .....	4
Industrial and college training together benefit me greatly .....	1
To do great service for my race .....	4
Useful even to a laborer .....	1
Have no reason to regret .....	5
It has been the best investment .....	3
Nothing above it but virtue .....	1
Wish I had time for more .....	6
Gave me a foundation .....	2
No other could take its place .....	1
It has enabled me to educate 500 persons .....	1
It has been invaluable to me .....	2
Great service in rearing my children .....	1
It has not, in my line of work .....	1

## WOULD SOME OTHER TRAINING HAVE BEEN OF MORE SERVICE?

I think not .....	172
Doubtful .....	11
Not sure .....	7
Some system to keep in mind professional intentions .....	1
An agricultural course might have been of more benefit .....	1
Good business course would have been better .....	2
Industrial training helps .....	1
Judging from present conditions, no .....	1
A scientific course .....	1
There is no substitute .....	1
No other could be of so general service .....	3
Could tell if I had used my energies in another direction .....	1
A practical course in the English Bible and in music training .....	1
A course in music .....	1
Would not exchange for another kind. It is an eminence from which all other fields can be surveyed .....	1
No other kind could have .....	7
Would not exchange .....	2
A commercial in addition .....	3
Not as far as I can observe .....	1
Some other in addition would have been helpful .....	4
No other would have suited my case .....	1
Financially, some other might .....	9
A more complete training would be beneficial .....	1

A complete mastery of one trade would be of great help in addition .....	8
Would have to try some other to be sure .....	2
Architectural drawing would have helped me .....	1
No other in my profession .....	2
Tried another, but found college most beneficial .....	1
A practical training would have been quite beneficial .....	1
Primary work more beneficial in my work .....	1
A course in sewing .....	1
A carpenter's and a printer's trade in addition .....	1
Can not say .....	18
Yes .....	2

From a careful consideration of the facts and of such testimony as has been given the following propositions seem clear:

1. The great mass of the negroes need common school and manual training.
2. There is a large and growing demand for industrial and technical training and trade schools.
3. There is a distinct demand for the higher training of persons selected for talent and character to be leaders of thought and missionaries of culture among the masses.
4. To supply this demand for a higher training there ought to be maintained several negro colleges in the South.
5. The aim of these colleges should be to supply thoroughly trained teachers, preachers, professional men, and captains of industry.

The central truth which this study teaches to the candid mind is the success of higher education under the limitations and difficulties of the past. To be sure that training can be criticised justly on many points: Its curriculum was not the best; many persons of slight ability were urged to study algebra before they had mastered arithmetic, or German before they knew English; quantity rather than quality was in some cases sought in the graduates, and above all, there was a tendency to urge men into the professions, particularly the ministry, and to overlook business and the mechanical trades. All these charges brought against the higher training of the negroes in the past have much of truth in them. The defects, however, lay in the application of the principle, not in the principle; in poor teaching and studying rather than in lack of need for college-trained men. Courses need to be changed and improved, teachers need to be better equipped, students need more careful sifting. With such reform there can be no reasonable doubt of the continued and growing need for a training of negro youth, the chief aim of which is culture rather than bread-winning. Nor does this plain demand have anything in it of opposition or antagonism to industrial training—to those schools

which aim directly at teaching the negro to work with his own hands. Quite the contrary is the case, and it is indeed unfortunate that the often intemperate and exaggerated utterances of some advocates of negro education have led the public mind to conceive of the two kinds of education as opposed to each other. They are rather supplementary and mutually helpful in the great end of solving the negro problem. We need thrift and skill among the masses; we need thought and culture among the leaders. As the editor has had occasion to say before:

"In a scheme such as I have outlined, providing the rudiments of an education for all, industrial training for the many, and a college course for the talented few, I fail to see anything contradictory or antagonistic. I yield to no one in advocacy of the recently popularized notion of negro industrial training, nor in admiration for the earnest men who emphasize it. At the same time I insist that its widest realization will but increase the demand for college-bred men—for thinkers to guide the workers. Indeed, all who are working for the uplifting of the American negro have little need of disagreement if they but remember this fundamental and unchangeable truth: The object of all true education is not to make men carpenters—it is to make carpenters men."

## HIGHER EDUCATION OF THE NEGRO—ITS PRACTICAL VALUE.

By President HORACE BUMSTEAD, D. D.,

*Atlanta University, Georgia.*

All education is practical which can be turned to use and made productive of some desired end. In the education of the American negro there are certain ends which all good people agree in desiring. The appalling illiteracy of the masses must be reduced. The criminal tendencies of the lower classes must be checked. The productive capacity of the wage-earners must be increased. The domestic life of the race must be improved. Their citizenship must be safeguarded and ennobled. The development of personal character must be stimulated—this last the most important of all.

### MANY CLASSES OF NEGROES.

It is idle to suppose that all these desired ends can be secured by any single form of education without the cooperation of other forms. No man can wisely shout "Eureka," and proclaim the race problem solved by any one method of training. The problem is too manifold, too complex, too intricate to admit of solution by a single panacea.

Moreover, the American negro is in condition to receive in due proportion a much greater variety of education than many people have supposed. We have too long made the mistake of regarding the race as one homogeneous mass instead of recognizing the diversity of its different classes. The 4,000,000 set free by the civil war have grown, probably, to 9,000,000, or nearly as many as the entire population of the United States in 1820. So large a population as this, mostly born in freedom and growing up for thirty-five years in contact with American civilization, could not fail in that length of time to differentiate itself into classes of varying character and ability, illustrating many different grades of progress. No careful observer can deny that this differentiation has taken place. The more hopeful classes may still be small relatively to the whole mass of the negroes, but they are too large absolutely, and they are potentially too important a factor in the solution of the great problem, to be safely ignored.

With full recognition, then, of the varied forms of educational effort needed and with no desire to disparage any of them, let me come to my task of presenting the practical value of the higher education. And I will ask you to measure this value as related, first, to the individual negro himself, and second, to the social group or mass of negroes of whom the individual forms a part.

For the individual negro who so far rises above the common mass of his race as to be fitted to receive it, I believe that the higher education has a preeminently practical value.

If the term "higher education" needs definition, let me say that I have in mind such education as an average white boy gets when he "goes to college." I mean a curriculum in which the humanities are prominent and in which intercourse with books and personal contact with highly educated teachers constitute the chief sources of power. Let us, furthermore, understand such a curriculum to be handled not in any dry-as-dust spirit, but with the most modern methods of teaching and with the most direct and practical application to the needs of modern life as they will be encountered by the students pursuing it.

#### INDIVIDUAL OPPORTUNITY.

There is a practical advantage in the mere offering of such an educational opportunity to the individual negro of exceptional ability. So long as it is denied he will ask, "On what ground do you set a limit to my educational progress?" If we answer "Because the masses of your race are not fitted to take a college course," he can reply, "That is a principle of exclusion which you do not apply to your own race, and why should you apply it to mine?" If we say, "Because we doubt your individual ability to take it," he may answer, "That is a matter which only a fair trial can determine, and I ask the privilege of testing my ability as an individual." How can you justly refuse such a plea as this? If the claimant really has exceptional ability he ought to have the exceptional opportunity. If he does not possess such ability it is still worth something to set before him the open door of the higher education, for then, if he does not enter it, the responsibility is entirely his own. In education there is no principle more just or wise than this: To every negro youth, as to every white youth, an educational opportunity commensurate with his ability as an individual.

Let us not forget in this connection to how large an extent it is in the province of all colleges to discover talent. For many boys and girls the studies of the grammar and even of the high school are insufficient to reveal their most marked aptitudes and point out the most promising path of usefulness. It is only as they are confronted with a college curriculum that this revelation is made in the case of very many. It is sometimes said that any bright negroes in the South who want a college education can come to Northern colleges and get it. This may be true as regards the very brightest who can feel the attraction of an educational opportunity a thousand miles away and obtainable there only at high cost. But for a much larger number, only the inexpensive college of the vicinage, within easy reach of home, can either discover talent, or train it when discovered.

#### TEACHING TO THINK.

A very practical service which a college education renders to the individual negro is to teach him to think. The power of rational thought is one which the past history of the race has not tended to cultivate. Neither savagery in Africa nor slavery in America were favorable to it. As a slave the negro was trained not to think. The thinking negro was a dangerous negro. The master and the overseer did his thinking for him, regulating his movements and planning his work, and the more the negro surrendered his self-direction and became a facile machine in their hands, the better slave he was. This is an unavoidable feature in every system of human slavery.

But the moment freedom begins and the responsibility for one's life and work is transferred from an outside authority to the individual himself, the power of

rational and consecutive thinking becomes an absolute necessity. It is the lack of this power which constitutes one of the chief elements of weakness in the negro of to-day. The studies of the usual college curriculum are especially fitted to develop it. Slavery did much to make the negro a worker, and since slavery ended we have all been very properly concerned to make him more and more a skilled worker. But we have been far too little concerned to make him a careful thinker.

Incidentally to this, a very practical advantage which comes to the individual negro through a college education is the discovery of how large a part of the world's work is performed by the world's thinkers. The delusion that work of the hands is the only work worthy of the name can not remain long in the mind of a college student. In the study of history, and science, and language, and philosophy, and mathematics, he discovers again and again how the chief workers in those fields have been foremost among the promoters of the world's progress, ever cooperating with and stimulating the work of the hand workers and often exceeding them in the severity of their toil. It is not too early for the negro to learn that some of the opportunity and responsibility for the brain work of the world belongs to him, and that in proportion as he is able to embrace it and use it well will his race achieve a symmetrical development of its powers, more nearly approaching that of other races, and so gain more and more the respect of their fellow-men.

#### NEED OF INCENTIVE.

But the individual negro needs not only opportunity and training for working with both hand and brain, he also needs incentive for working, and the highest kinds of incentive. If anything, he needs incentive more than he needs opportunity. There are numerous opportunities open to many a negro which he fails to utilize simply from lack of incentive. He is too easily content with his low estate, and has too little ambition to improve it. There is probably not a negro in the South who does not have the means, the skill, and the time, which constitute opportunity, for making his condition less wretched than it is, if he wanted to. But the trouble is he does not want to, and never will want to until sufficient incentives are set before him. It is a good thing to present the incentives of material comfort and financial prosperity—to tell the negro he can have a better house and a more productive farm and an account at the bank, if he will only bestir himself; these are all worthy incentives for effort, but they do not go far enough. It is as true of the negro as of any other human being, that the life is more than meat and the body than raiment, and that a man's life consisteth not in the abundance of the things he possesseth. Does it not behoove us, then, to awaken within the negro's soul the desire for a better life for himself and family in that better home, whenever he shall get it, and to stimulate a craving for higher pleasures than those of the body, to the gratification of which he may utilize his abundant harvest and his growing bank account? Many a negro already has more of this world's goods than he knows how to use wisely, either for himself or for others. Making a livelihood is important, but realizing a wholesome life is more important. The "plain living and high thinking" of our homespun ancestors in New England and Virginia is a worthy object of aspiration to set before the American negro of to-day. From the colleges and universities it came to our ancestors, and from colleges and universities it must come to the negro. And as it comes, his incentive to work, with both hand and brain, for both the material and the spiritual progress of America, will be increased.

But it is time to turn to the second part of our subject.

## THE EXCEPTIONAL NEGRO AND THE MASSES.

In a recent address President Tucker, of Dartmouth College, used these words: "I believe, with a growing conviction, that the salvation of the negro of this country lies with the exceptional men of that race." These words of President Tucker concisely express the truth which explains the practical value of the higher education to the negro as a social group or mass of which the individual forms a part. In showing how college training is of practical advantage to the individual negro, in enabling him to discover and train his highest powers, and in furnishing the most potent incentives for their use, we have by no means stated the strongest reason for such education. A much stronger reason is to be found in the relation which the college-bred negro holds to the masses among whom he dwells and works. The masses may not be able to go to college, but they may send their representative to college, and when he comes home they may be wise by proxy. This does not mean that they are all going to learn Latin and Greek from their representative or make him a little demigod of culture for their worship. But it does mean this: That in every community of negroes it ought to be possible for the common people, occasionally at least, to look into the face of a college-bred man or woman of their own race and catch something of inspiration from his high attainment. Currents of culture and progress are ever being set in motion among the masses of mankind by this sort of educational induction, even where no direct efforts are put forth to that end.

But the opportunity for the direct and positive activity of the college-bred negro in promoting the elevation of his own people is of the most varied and striking character.

## NEGRO PUBLIC SCHOOLS.

Consider the matter of popular education in the public schools. The South has separate schools for the two races, and custom requires that the teachers of these schools shall be of the same race as the pupils attending them. The 30,000 negro public schools, on which the Southern States are spending six and a half million dollars annually and have spent over a hundred millions since 1870, are greatly weakened and the vast sum of money spent on them wasted because of the inefficiency of the negro teachers. To stem this great tide of waste and to provide teachers of the desired efficiency there is no influence more potent than that of the negro colleges in the South. The graduates of these colleges not only teach in these schools, usually filling the most prominent positions in them as principals or otherwise, but they are also teachers of teachers, a single individual often numbering the teachers whom he has trained for other public schools by the scores and hundreds, and the pupils thus reached at second hand by the thousands. One graduate of Atlanta University has trained 200 teachers, who in turn are instructing 10,000 children.

These college graduates are also prominent in organizing and maintaining State associations of negro teachers, and in conducting, under the direction of State superintendents of education, the summer teachers' institutes which are fostered by appropriations from the Peabody fund. In one case a negro graduate has served for eleven years as a member of the city board of education by appointment of the mayor and aldermen in a large Southern city.

## RELIGIOUS WORK.

The religious work of the race presents another most important field of activity for the college-bred negro. While slavery lasted the negroes in many localities shared the religious privileges of their masters, and listened to the sermons of educated preachers. With the advent of freedom, and the inevitable separation

of the races in so many of the relations of life, the negroes very naturally organized churches of their own, to the pulpits of which they called men of their own race, in most cases with little or no preparation for their work. Though some advantage was gained in the assumption by the negroes of the responsible management of their own church organizations, there was an undoubted loss for the time being in the character of their religious and moral training, and it is not unreasonable to suppose that to this, among other causes, may be attributed the criminal tendencies of the race in their new life of freedom. While the character of the negro ministry is gradually improving through the accession of better educated men to their ranks, the supply of such men is far inadequate to the need.

#### OTHER PROFESSIONS.

As physicians, too, college-bred negroes find an important field of usefulness. Aside from the ordinary round of their medical practice, they are needed to foster the work of hospitals and training schools for nurses among their people. They can also do much in instructing their people in matters of hygiene, in improving the sanitary condition of their homes, and in the proper care of young children; thus helping to reduce the excessive death rate of the negroes. In much of this work they can accomplish far more than white physicians working among their race could do.

The opportunity for the college-bred negro in the legal profession is not so large, nor the call so urgent as in the occupations already considered. But in proportion to their numbers the few college-bred negroes who have become lawyers are having as successful and useful careers as the members of other professions.

Some editors, too, must be supplied by the negro colleges, and these, in cooperation with the lawyers and ministers, will be more and more needed as the race progresses to foster a wholesome public opinion among the negroes, to elevate the character of their citizenship and harmonize their relations with the white race.

#### SELF-REGENERATION OF THE RACE.

Another field of activity which loudly calls for the attention of all college-bred negroes, whatever their specific occupation may be, is the matter of organized efforts for their own social uplift. In every considerable community the negro teachers, ministers, doctors, lawyers, editors, and others occupying prominent positions have it in their power, by united action, to promote efforts for reform in such matters as temperance, purity, the improvement of home life, the training of children, the provision of wholesome amusements, the organizing of reading clubs, debating societies, and lecture courses, and in general so ministering to the higher life of their people as to help them to stem the tide of animalism and materialism that is ever threatening to sweep them away. Considerable of this work has already been undertaken with fair success, generally under the auspices of the negro churches, secret societies, and other beneficial orders. But the organizing power of the negroes is still in a somewhat crude stage, and greatly needs the enlightening and directing influence which the college-bred negroes can furnish, and are already furnishing to an encouraging extent. And herein appears another very practical advantage of the higher education of the negro, in that it is helping him to do for himself that which many have supposed only the white man could do for him. We have too long failed to recognize the tremendous power for the self-regeneration of the race to be found in the race's highest class, and in the aspiring members of its middle class. The discovery and equipment of this power is one of the very practical services rendered by the colleges for negroes.

## AN APPEAL TO FACTS.

A striking confirmation of the positions taken in this paper is to be found in the results of a careful investigation into the careers of college-bred negroes under the direction of Dr. W. E. B. DuBois, as brought out at the Fifth Annual Conference on Negro Problems, recently held at Atlanta University.<sup>a</sup>

Since 1826, 2,414 negroes have been graduated from college; most of them since 1870, and for the last six years to an average number of about 130 a year.

With few exceptions these negro college graduates have found work as teachers and professional men and also in newspaper work, business, farming, and the trades. Returns from some 600 show an individual holding of real estate of an average assessed value of nearly \$2,500.

Returns from more than half of all these graduates show that 55 per cent were teachers; 19 per cent ministers; 6 per cent doctors, and 3 per cent lawyers, or 83 per cent engaged in teaching and the professions.

Ninety per cent of those graduated in Southern colleges remain and work in the South, while fully 50 per cent of those graduated in the North go South and labor where the masses of their people live.

To the question: "Do you vote?" 508 answered "Yes," and 213 "No." To the question: "Is your vote counted?" 7 said "No," 61 were in doubt, and 455 answered "Yes." To the question: "Are you hopeful for the future of the negro in this country?" 40 were in doubt, 52 said "No," and 641 answered that they were hopeful.

May we not safely conclude that the negro college graduate as an individual is a good breadwinner, thrifty property holder, and conservative citizen, and that as the exceptional man of his race who has enjoyed exceptional opportunity, he is devoting himself in a very remarkable degree to the forms of service most adapted to the uplift of the masses in intelligence, morality, and good citizenship? What can be more practical than an education that secures such results as these?

I plead for a larger faith in the exceptional negro—a larger faith in his capacity as an individual, and a larger faith in his power as a regenerator of the masses of his race, on whom we should seek more and more to shift the "white man's burden."

#### FRANCIS WAYLAND PARKER.<sup>a</sup>

[*Late director of the School of Education, University of Chicago.*]

By WILBUR S. JACKMAN.

*Dean of the School of Education.*

[BIOGRAPHICAL NOTE.—Francis Wayland Parker, who died on March 2, 1902, was born in the village of Piscataquog, N. H. (now incorporated with the city of Manchester), on October 9, 1837. His ancestry was of the strong New England stock, and in every strain of it there were ministers and teachers. His early education, which he received in the village school and at a country academy, was of the scantiest. In 1852-1855 he attended King William's University at Berlin, but he was in a true sense a self-educated man. From his sixteenth to his twenty-first year he taught with marked success in various places in his native State. In 1858 he took the principship of the public school at Carrollton, Ill. When the civil war broke out he returned to New Hampshire and joined the Fourth New Hampshire Volunteers, not having been able to enlist in Illinois. Entering the Army as first lieutenant, he left it at the close of the war as colonel. Many avenues of success, political and financial, were open to him at the close of his military service, but he remained faithful to teaching, his chosen profession. "I do not remember the day," he afterwards said, "when I did not believe that I should be a teacher." He first attracted wide attention by his reform work as superintendent at Quincy, Mass., from 1878 to 1880. In 1880 he was made one of the supervisors of schools of Boston. From 1883 to 1899 he was principal of the Cook County (afterward the Chicago) Normal School. This position he resigned to assume the presidency of the Chicago Institute, the pedagogic school founded by Mrs. Emmons Blaine. When, a year ago, the institute became a part of the University of Chicago, as the School of Education, Colonel Parker remained at the head of it as director. Colonel Parker was twice married—in 1864 to Miss Phene E. Hall, of Bennington, N. H., and in 1882 to Mrs. M. Frank Stuart, of Boston.]

Colonel Parker's entire philosophy and practice of education rested solely upon the theory that democracy furnishes the highest and best type of government for an enlightened and self-respecting people. From this pregnant germ grew everything that he thought and did in the class room. His conception at once connected his ideals as a citizen with his motives as a teacher, and it linked the destiny of the country with the fate of the schools.

---

<sup>a</sup> Reprinted from the American Monthly Review of Reviews, April, 1902.

He never failed to inveigh against the selfishness of aristocracy. "Its design," he said, "is the complete subjugation of the masses to the domination of the few; its methods, to prevent human souls from seeking and finding the truth." He believed that its methods of mystery, of force, of keeping the people in ignorance, of isolation of the people into classes, of caste formation, of class education, are all diametrically opposed to the great axioms of democracy. Holding that the motive controls the method, it was manifestly impossible for Colonel Parker, directly, to import and incorporate with his own the methods of any foreign educational system. An aristocracy seeks the perpetuation of an existing state through an appeal to history and tradition; he labored rather for a continuous evolution by turning the whole people back upon the original springs of nature for a constant clarification of insight and renewal of strength.

From the principle that society can rule itself, it was but a short step to the proposition that the child must be made free and kept so, if his life is to contribute to the growth of democratic ideals. The application of this doctrine in the everyday life of the pupils was the source of some of the most serious misunderstandings that ever arose in connection with his school. It was only natural that the sudden emancipation of the children from the arbitrary rule of average schools, and from that of many homes themselves, should lead to some boisterousness, and even license. The unaccustomed privileges of freedom often gave to the school a semblance of disorder. This was shocking indeed to the nerves of the stickler for "discipline," who could not penetrate through the unessentials, which appeared conspicuously on the surface, to the real, growing, and harmonious life below. But in the face of ridicule, sarcasm, and unmeasured denunciation, Colonel Parker never winced, and his faith never faltered in the ability of the child, under natural and normal conditions, to govern himself. He did not countenance and encourage license, as the shallow observer was apt to suppose; he believed, however, that complete and untrammelled freedom in the end would lead to the best possible government. As opportunities occurred in the administration of the school, he tried to show how inevitably great burdens of responsibility must rest upon the shoulders of the truly free. No one who witnessed it can ever forget the scene as he used to rise at the close of the "morning exercise," just before dismissing the pupils for the day's work, and say, "What is the great word?" Instantly the answer would come back from the whole school in a happy shout, "Responsibility." Bending forward in a listening attitude, he would say, "I scarcely heard it; say it again." Twice and thrice would the word be repeated with deafening vehemence. Then he would add, "Yes, that is it; this little boy right here before me, this little girl, each one is responsible for the whole school to-day," and with an answering smile they appeared to assume the trust. The war waged upon Colonel Parker was not upon trifling details; it was upon the fundamentals in human life. Through their instincts the politicians at least dimly foresaw the result upon their own ambition if childhood were to be allowed this sweet taste of freedom; hence they and all other manipulators of men fought him as for their lives.

The freedom of the child means an emancipated teacher. Colonel Parker iterated again and again that nothing should be allowed to stand between an individual and success but himself. This brought him into immediate conflict with superintendents, boards of education, political machine men, and with the whole fraternity of ax-grinding timeservers that infest the earth. With eagle vision and lion-hearted courage he penetrated their best-laid plans and met them at every turn in relentless opposition. Enraged at defeat, they called him a despot and sneered at his ideas of democracy. To the teachers who stood behind the walls, which he with sleepless vigilance patrolled, he presented a totally different aspect. Toward those who were trying to use the individual freedom

which he strove to assure, no one could be more forbearing or patient. For Colonel Parker the world of thinkers divided itself into just two classes, those who could see a principle and those who could not. With the former he was willing to work side by side, and endlessly, all as privates in the ranks; with the latter, in thought, he had but little in common. His constant exhortation was to work from principle and have the courage to be crude. There was no work so raw or imperfect in which, if the teacher could demonstrate its alignment with law, he would not take the profoundest interest. There was no teacher who brought to his labors the spirit of a discoverer who could not rely implicitly upon his unyielding protection and support.

This attitude toward the members of his faculty again gave rise to apparent confusion and to strange misunderstandings. The ordinary signs by which people long have been taught to recognize the so-called system or plan of the school routine were almost entirely wanting. It seemed difficult for the lay mind to understand how there might be unity of purpose underlying such great dissimilarity of method. In the majority of schools it has been the custom for some one, usually the superintendent or principal, to set and control the pace of the teacher by imposing a *modus operandi*, which all are expected to follow. Hence the prevailing idea of system, hence the ease with which most schools can produce and print a "course of study," while Colonel Parker could neither exhibit the one nor formulate the other. In his school methods varied, not only with the different teachers but with each teacher they changed from day to day.

The children were taught that they could and did promote themselves. There was no system of arbitrary marks and absolutely no records kept that attempted to give the pupil's standing in numerical terms. The records that were esteemed as having value were in the forming of the pupil's work itself. Great care was taken of the writings, drawings, models, and other products of hand work that were prepared in connection with the different subjects. These were preserved in the school and finally sent to the parents as the best evidence of the pupils' advancement and skill.

With the feelings of reciprocal usefulness that were cultivated by the teachers and pupils, and which grew out of the freedom that all enjoyed, it was inevitable that the school should become a highly developed social organization. More than a decade ago Colonel Parker wrote:

The social factor in the school is the greatest factor of all; it stands higher than subjects of learning, than methods of teaching, than the teacher himself. That which children learn from each other in play or work, though the work be drudgery, is the highest that is ever learned \* \* \* This mingling, fusing, and blending give personal power, and make the public school a tremendous force for the upbuilding of democracy.

The surface test which he always applied in determining the social condition of the school at any time was that of genuine happiness, which the life of the place expressed. He felt that without happiness the best work was impossible and, conversely, that actual work under normal conditions always resulted in happiness. He often told the school that when he could raise the money he proposed to endow in his faculty a chair of fun, but the teachers and pupils seemed to feel that while his buoyant spirit was with them there was for this no urgent necessity.

"The socialization of the school" is a hackneyed phrase that threatens to become cant before its real meaning is understood. Colonel Parker held that it could be wrought out only through a free interaction among the pupils and teachers, whose experiences, based upon natural activity, were being developed through educative work under normal conditions. The highest type of social life consists of more than a mere aggregation of individuals endowed with social instincts. Hence it was that he gave such tremendous support to all the means that could be devised

for keeping his whole school in continual and intimate contact with nature. The city, especially the slums, was not the ideal place, in his judgment, for the growth of the best social type of the individual or of the group. He preferred, rather, the country, not only because he regarded pure air and sunshine, and all of nature's influences, essential in laying the physical foundation upon which the teacher should build, but also because he believed that the child, from its earliest years, should be subjected to those original and potent spiritual influences which seem to emanate, without the intervention of the teacher, from nature herself. In support of this belief he continually cited the experience of his own childhood, and the dream of his later years was that his school might have the freedom of a farm. It was in spite of discouragements and opposition, which few can understand, that he therefore gave the school excursion practically the precedence over every other exercise on the programme. To the same end, Colonel Parker was earnest in his efforts to bring the work of the class room into keeping with the actual interests of the home. The value of the instruction was to be determined by its effect upon the children in their daily round of duties outside of school. If it made them more polite, more anxious to take cheerfully their share of the family tasks, and generally more sensitive to all the demands that community life places upon the individual, then the school might be considered as accomplishing its true purpose. There was constant effort to keep the pupils in vital touch with all the industrial and commercial enterprises to be found in the surrounding community, and everything possible was done to make them realize that they were actual participants in these activities.

In order to cement still more closely the union of the home and school, for eighteen years or more Colonel Parker organized and conducted parents' meetings. In these gatherings, through the work of the children, by expositions on the part of the teachers and by round-table methods, he sought to acquaint the community with his aims in education and with what was being done for the pupils. It was through the knowledge of his principles and work, largely thus diffused, that he slowly fortified himself in that public sentiment which more than once rose in its might and saved him and his school from the designs of the charlatan and the spoilsman.

It was one of the theories of the school that the devotion of the strong should be placed at the service of the weak. This service was desired not more for the sake of the weak than it was for the strong themselves. As a result, many a defective or incorrigible, so called, found a refuge within its walls. There was constant experimentation to find out what might be done for such children. The boundary line between those that were normal and those defective was being continually resurveyed; and it was these unfortunates, often, that called for the highest exhibition of the genuine social feeling.

The great emphasis which was placed in the school upon the necessity of having one's knowledge expressed through service, and the large attention devoted to the development of the means whereby it could become immediately available, gave rise to rather a widespread notion that Colonel Parker placed a low estimate upon knowledge. This, coupled with his open contempt for the antiquated methods that prevailed, as he suspected, even in universities, led many to believe that he despised higher education. Nothing could have been further from the truth. "Knowledge for the sake of knowledge" represented to him a selfish hoard. Art for art's sake typified meaningless expression. The plan, however, upon which his school was built made incessant demand for a course of study rich in subject-matter. Everything that existed in nature he sought to place at the disposal of the pupils. No query from the students was ever passed by unnoticed. Thousands of carefully selected volumes formed a working library that was at the constant service of all the pupils in the grades and the students in the peda-

gologic school. Chiefly through the efforts of Mrs. Parker, in the beginning, large numbers of pictures, covering a world-wide range of subjects, were mounted and classified and used in the greatest profusion in the class rooms. Exhaustive lists of references to both books and pictures, which put the learner in touch with practically every phase of his subject of study, were being continually prepared by the librarian. The school museum was filled with hundreds of specimens arranged in series and groups illustrative of facts in nature, and also with the products of art and industry gathered from all corners of the globe. Through these, and in scores of other ways, as means of acquisition, Colonel Parker gave indisputable evidence that he placed the highest estimate upon knowledge and culture. The effect upon his students was marked, the uniform testimony of those with whom they came in contact being that they were filled with an earnest and intelligent desire to know.

With such enlarged opportunity for acquiring knowledge and the high motive for its use, a wide range of expression became a necessity. Among the first to introduce manual training in the grades, he followed this with all the "fads" as rapidly as he could secure instructors to give him the proper assistance. The work was begun with teachers unskilled in their art, but they gradually became trained through their work with the children. In the face of the bitterest opposition he toiled with boundless patience until drawing, painting, clay modeling, and making, all became established as integral parts of the curriculum, and he lived to see the day when the cry of "fads" was no longer heard in intelligent communities.

No less strong was the opposition which he encountered to his methods of teaching reading, writing, and number. It was his theory that these subjects could and should be taught under the impulse of intrinsic thought. He believed that, as modes of study and expression, they should be taught when the study of the central, or nutrient, subjects of nature and man demands their use, and his methods were based upon that belief. Consequently he rejected the idea that a set vocabulary must be acquired before a child should be allowed to read as a means of study. He also repudiated the notion that there must be the usual copybook training in the drawing of letters before the pupil be allowed to write. To carry out his method a printing press, established in the school and placed in charge of a practical printer, turned off, every year, hundreds of pages of reading matter for the children, which they themselves had derived from the different subjects studied. In regard to reading and writing, the practice of several years has amply demonstrated the truth of his theory; as to number, his prophecy is only beginning to be fulfilled.

In operating a school according to the plan developed under Colonel Parker, it is easy to understand why each member of the teaching force is compelled to be a close and persistent student. Under his conception—the child the demand, God the supply, the teacher the means—there is scarcely any limit that can be set to what a thoughtful teacher may do. With the inspiring stimulus of new visions revealed by a constantly receding horizon, it is small wonder if overwork and overstrain were sometimes found in the faculty as the result of a supreme effort to take just one more step in the field of discovery.

The ever-to-be-remembered weekly faculty meetings must take first rank among the various means of study that were devised for the teachers. For many years they were held on every Monday evening in the Colonel's own well-appointed home. After the day's work, settled comfortably within the depths of a great cushioned chair, with closed eyes, with the insight of a master, he reviewed again and again the entire work of the school. He was eternally going back for the principle that controlled the teacher's action, and woe betide the one who became weary in the search! The questions always were, "Are you headed right?" "Is

it quality or quantity that you are after?" "Are you trying to cover ground or to develop character?" "What have you to think about except the present needs of the growing child?" He was fond of saying, with Emerson, that heaven is quality. "The line of human progress is infinite, and we have but started. As yet we have but touched the hem of the garment; what we have done is as nothing compared with what we shall do if we persist in our study of the real problems of education." Under a continual fire of such interrogations and criticisms, expressed or implied, he sought to keep every teacher alert and keenly sensitive to all the possible influences that might be brought to bear for the good of the children and the school.

The teachers were also called upon to forecast their work, so that each might have an opportunity to study the whole in a proper perspective. These forecasts, in the form of outlines, syllabi, and general discussions, have been published for several years, first as leaflets, but lately in the more pretentious form of a magazine. This mass of material, in a constant state of ferment and evolution, is the nearest approach to a published course of study that the school has ever made.

It was inevitable that a school conducted upon such a plan as that contemplated by Colonel Parker should be confronted at once with problems in the adjustment of details with which the programme and methods of the old-school régime were utterly unable to deal. The theory of concentration and correlation seemed to offer the only possible solution. By the former he tried to focus the entire attention of every teacher, not upon the subject-matter to be taught, but upon the real goal—the development of character. Through a careful and judicious selection of the mental nourishment actually needed by the pupil at a given time he believed that the separate subjects of study, so called, would prove to be organically related, and also that a just recognition of their natural interrelationships would lead to a great economy of effort and to an immense saving of time on the programme. This is the essence of his theory of correlation.

The development of the theory of concentration and correlation gradually drew the teachers into closer and more harmonious relationships than usually exist in schools where the isolation of subject-matter is the rule. It tended to develop a spirit of consideration and mutual helpfulness in the faculty which greatly increased the happiness of each instructor in his work and added enormously to the influence of the school.

Behind the work of Colonel Parker lay the great background of his personal character. His dominating passion was his love for little children, and in his treatment of them he was infinitely tender and forbearing. He had a humorous side which always pleased them immensely. Often at the close of the "Morning exercises," rising, he would say, with impressive gravity, "Ladies and gentlemen!" adding, after a pause, "Am I right?" Then, following an affirmative chorus from the children, he would say, "That's all there is to it." He rarely was discouraged or depressed; a splendid optimism marked him under the most trying conditions. Surrounded by circumstances that developed Spartan traits, he never lost the buoyancy of youth. Superintendent Bright well said in an address over his bier: "He was such a boy; he was such a man!" It was his hopefulness as much as his courage that carried him through the years of struggle. He was a prophet and an inspirer of men, and he was also a mighty "Doer of the word." He brought things to pass, and it was through actual accomplishment that he inspired. Many who conceded his power to outline the larger aspects of a plan supposed him unable to descend to its particulars. As a matter of fact he was a master in comprehending and in handling the details of his own particular scheme, though for the minutiae of the ordinary school machine he had the utmost contempt. Nothing from the kindergarten to the graduating class of teachers escaped his attention. Clear in his ideals, he had marvelous power of penetration

into a teacher's motives. Possessed of well-defined standards, with great accuracy he could gauge almost instantly the value of the teacher's efforts. In his care of the smaller affairs of the school he never became a purveyor of tricks. Why some of his critics should regard him as a huckster of devices is incomprehensible to those best acquainted with Colonel Parker in his work. Above all, he prized and cultivated to the last an open-mindedness and a hospitality toward new ideas. In his last faculty meeting, about a fortnight before the end, at the close of a clear and beautiful talk to his teachers, in which he exhorted them to seek patiently for the truth that he should not live to find, he warned them especially against a fixity of mind. He said: "I think I shall formulate a prayer; it will be, 'O, Lord, preserve Thou me from the foregone conclusion.'" The acceptance of any proposition as a finality was in his view a voluntary blocking of the way to new truth.

Colonel Parker's work to him is ripened fruit; to those who remain it should be a seed; his meridian is but the horizon line of those who follow. A blind worship is the greatest menace to true discipleship. It is natural, perhaps, for those whose lives have been enriched and uplifted by his ideals to desire to fix, as in chiseled stone, the life that once illumined them. But in the memory of those who knew him best his spirit will find no counterpart in marble or in bronze; rather will the similitude appear in the springing life of the growing seed, in the freshness of the unfolding bud, and in the verdure of the evergreen pine.

---

#### "THE QUINCY METHOD."

[Substance of an address delivered by Colonel Parker at the celebration of the twenty-fifth anniversary of the "Quincy movement," April 20, 1900.]

There was an opportunity, a sensible school board, a board that conducted its affairs upon sound business principles, upon a plan that has always, in all times, brought success, a plan that the entire business world unqualifiedly indorses. No other plan has or will ever succeed. To appreciate this famous board, it must be compared with other boards of the same functions. To have been for forty-six years a teacher of the common schools gives one a fair basis for comparison.

One of the profound mysteries in this world is the marvelous psychological change that comes over respectable, intelligent, and otherwise wise laymen when they are elected by their fellow-citizens to serve on school committees. Persons who would never dream of superintending an electric plant, managing a railroad, building a bridge over Niagara, leading an army, or commanding a ship enter upon the duties of a school committee with the astonishing presumption that they can with safety minister directly to the welfare of children, mold society into right living, and shape the destinies of a nation by means of common education; that they can make courses of study, select teachers, examine pupils, and manage the internal and pedagogical affairs of a school system. This prevailing state of affairs would be ridiculous were it not so awfully solemn. The presumption of school boards is the acute distress of the nation; it is the culmination of bad politics, the very worst by-product of democratic evolution. For this presumption millions in money are wasted every year, countless children suffer, and free government is imperiled.

The members of the Quincy board of education made up their minds, after the most careful and thorough consideration, that they were not equal to the task of managing the schools which the good citizens of the town had intrusted to their care.

It is often said that when a school board gives up its authority to an expert its duties are ended, that indeed it has nothing further to do. This was by no means

true of the Quincy committee. The superintendent was given full power to conduct the schools as he thought best. There was, however, one absolute requirement—he must succeed; and the committee was the judge of success or failure. Previous to 1875 the committee had examined yearly the schools in order to ascertain the progress of the pupils; now they proposed to inspect the schools to find out the efficiency or inefficiency of the superintendent; and well they did their work. What criterion they had, or upon what basis they estimated efficiency, is not known. Probably they estimated the real life of the school, the happiness and earnestness of the children, rather than technical details and quantity of book-work done.

The school board's most important task was to defend the schools and the changes in the work of the teachers.

Good people do not easily alter their ideals of education. I have sometimes thought that theology had the deepest and strongest hold upon the human mind, especially in New England; but that is not true; educational ideas are by far the slowest to change. Noah Webster is mightier than Jonathan Edwards, technical grammar than predestination. It is useless for anyone who attempts to improve education to complain; the right way is to recognize the situation and make the best of it. Human progress is measured by the time it takes for a good idea to get into life.

The board of education fought many battles, and fought them all with great earnestness and wisdom. One battle stands out above all others. The battleground was the old Town Hall, which was packed with eager voters. Late comers were obliged to stay outside, although it was a rainy day. Two thousand dollars a year seemed an immense sum for the taxpayers to spend for a man who walked or rode around from school to school. The leader in the campaign against extravagance moved a reduction of the appropriation that would cut off the man who amused himself by supervising the schools. The motion was carried with a rush. The second town meeting, succeeding the first by a few days, was extremely interesting. I shall not attempt to describe it—the memory of it always gives me a thrill. It was a battle royal for the little ones. I thought of the old days of Otis and Patrick Henry. At this meeting a motion was made to reconsider, backed by eloquence rarely heard in these days. Only the leader voted against the motion, and the original appropriation was carried without a dissenting voice.

The battle for the common schools is the battle for human liberty, and Quincy was fortunate in the defenders of that which lies at the basis of our Republic.

Permit me to interpolate a personal statement. I have been accused of fighting battles. It is not true; I never fought a battle, unless trying to teach school is fighting. The school committee did all the work of defense, and each member was a host in himself. The superintendent was granted the entire supervision of the town schools. The choice of teachers and their dismissal, the making of the course of study, the examinations, indeed everything that pertains to pedagogy, he relegated to his principals, and they in turn to their teachers. The tyranny of the superintendent consisted in demanding that every teacher should become free through self-effort.

The onus of all things disagreeable, such as the dismissal of teachers, the board took upon itself, merely asking the superintendent to make suggestions, which were sufficient for action. It gave generously an efficient support at all times; it did not hesitate to criticise, advise, or suggest. The first annual report was written under the frank and wise criticism of the committee; it was rewritten several times. The command was: "Make the people understand what you are doing." Through forty-six years I have never found another such efficient school committee.

The new superintendent had an immense faith in the possibilities of human growth by means of education, a faith which has grown with his years and is now stronger than ever. He had also a great faith in free government, brought about by educating children into freedom through self-activity. The battle for freedom, he thought, is not to be fought out in cruel, bloody wars, not by armies and navies, but in the common-school room, the camp and training ground for citizenship. The lessons of the civil war were to him lessons that taught how such awful horrors may be prevented by education.

Such faith led naturally to a spirit of work, of struggle, of research, of open-mindedness, for the truth. He had instinctively an all-controlling love for children and a strong desire to help them to good lives. Twenty-one years in the common schools as a teacher, including three years in country schools and three as principal of a normal school, had taught him very thoroughly the fact that he knew very little about the art of all arts. Every book upon education, printed in English, was on his shelves, but in them was scant knowledge of how to teach an American school.

I will not attempt to describe the educational situation in New England. One fact illustrates it fully: A diligent search was made on the rich and loaded shelves of Boston booksellers. One educational work, and one only, was found, a second-hand copy of Currie's Grammar School Education. Do not misunderstand. Very much had been done in building up the common school. Most school systems were thoroughly organized. That of Boston has furnished the pattern of organization for all time. There were excellent teachers, noble, disinterested men and women; but naturally tradition controlled, and there was a general, though unconscious, belief that most things in education were fixed and finished. Among thoughtful people, however, there were grave doubts as to the profitable expenditure of school moneys.

The superintendent had an overwhelming desire to find out what was true and what false, what should be eliminated and what brought into the lives of the children. He longed for an opportunity to study with thoughtful teachers, to study children in order to ascertain that which was best adapted to them. There was not one question of progress about which he was fully decided, except to study education with the right attitude toward genuine development. He found thoughtful teachers, some of whom had been doubting and studying for years, others who were ready to put themselves into the work with hearty zeal. The teachers—forty-two, I think, in number—formed a faculty for the study of education. The superintendent led them as best he could, getting from them far more than he gave. The authority he had received he relegated to them, and in return demanded close study, original thought, creation, observation, reformation, and independence. The teachers' meetings were the central means of movement. The superintendent trudged from school to school, watching the teachers, criticising them personally, holding conferences, and discussing questions. He taught in every class, over and over again, not by any means because he was a model, but because he wished to learn how to teach. It was exhilarating, delightful work, though filled with errors and doubts, crude, unformed, experimental, but withal progressive. He found genius among the teachers. One among the best has gone to her reward; she was a native of Quincy and a child of truth. There were very few teachers who failed of reelection. They tried, they struggled with the problems; some failed, but most succeeded. They were ever ready to take and use criticism, ever ready to acknowledge failure and to look for better things. I shall never forget them, that little band of heroes. I see them now, facing the children and the eternal questions.

What has been accomplished? I should be most happy this day to clear up some common errors that have crept into the general judgment. There never

was a Quincy method or a Quincy system, unless we agree to call the Quincy method a spirit of study and the Quincy system one of everlasting change. A method in teaching means to most people a certain way of doing things, a way fixed and finished; something that has a beginning and an end; something rounded, routinized, and efficient; a panacea, like a patent medicine, that may be applied with unflinching results. Method in this sense is the common and awful delusion of the present day. With the artist teacher method is the way he or she reaches an end. Therefore method is entirely personal, ever changing, ever improving. Insight, elimination, improvement, are the elements of upward and onward movements. We, the teachers of Quincy as a faculty, wrestled with the greatest problem ever given to man. The faculty and its meetings brought inspiration, enthusiasm, help, and each teacher applied, in his or her own way, the things found developing personality and, therefore, personal ability.

Those who seek for some special and peculiar method or device in the Quincy movement will never find it. Faith, ideal, spirit, explain all that pertains to our success, whatever that success may be. The outcome was what may always be expected under similar circumstances—progressive movement. If you ask me to name the best of all in results, I should say, the more humane treatment of little folks. We tried to teach them, "not as children or as pupils, but as human beings." Each child has his own individuality, his stream of thought, his desires, his hopes and fears, his grief and joy. In school the child has too often a separate stream of thought, or a stagnant pool, totally separate from his real life. A child should have one life, wholesome and complete, and the home life and the school life should each supplement the other. However loving a teacher may be, the method of teaching rarely discloses a deep sympathy, which is the best there is in any teacher. We tried to make the children happy, so happy that they should love to go to school. The rod was well-nigh banished. The doctrine of total depravity will have much to answer for in the day of judgment. Flogging is the direct result of the belief that the child is innately bad, and must be whipped into goodness.

We know that the child is good, if he has a chance, an environment of goodness. This knowledge came to us from actual experience. One beautiful incident threw a flood of light upon the child's soul. Little Bumpus, who was blind, entered Mrs. Follett's class of 6-year-olds. Without suggestion, the dear little folks put their arms around him and said: "We'll help you." Humanity begets humanity. Children long for something to do, and they love right doing far more than they love wrongdoing.

The systematic cultivation of selfishness by bribery—per cents, material rewards, and prizes—was banished. The dark clouds were cleared away, and a higher motive, a nobler ideal, came into view. The humane treatment of children can not be brought about by any particular method. It must spring from a deep sympathy, backed by courage and skill. The old-fashioned, stiff, unnatural order was broken up. The torture of sitting perfectly still with nothing to do was ruled out, and in came an order of work with all the whispering and noise compatible with the best results. The child began to feel that he had something to do for himself, that he was a member of society, with the responsibilities that accompany such an important position.

I might end this description here, for I have told all that is essential. But there are mistaken opinions to correct, opinions that have done much harm. For one thing, we did not banish text-books; we added to them; change, not banishment, was the order. It was the custom for pupils to read through in a year one little book that a bright, well-taught child can read from end to end in a few hours, providing always that he is not disgusted with the contents. They learned the book, often by heart, from their older brothers and sisters; they could say every

word, chant it, sing it, repeat it in their sleep, behold it in nightmares. It did not require much wisdom or even common sense to furnish the children with all the best literature then published. The committee appropriated \$500 for children's reading, and I spent it as best I could. I packed the precious freight of new books into an express wagon and drove from school to school, taking up books and furnishing fresh sets. The flood of literature for schools we have now is not twenty-five years old. The introduction of so-called supplementary reading now well-nigh universal, was then exceptional.

The spelling book was laid upon the shelf. Spelling was learned by the Quincy children in the same way that the human race learns to talk—by writing correctly and continually. Language was learned as it always must be learned—by using it correctly. Technical rules came in where needed. The alphabetic method was consigned to oblivion in obedience to commands from the highest educational authorities. The outcry against this defiance of nature had gone up for hundreds of years.

Learning by heart condensed and desiccated statements in geography and history was to some extent eliminated. Geography began with the real earth, and "mud pies" were introduced. I remember an old beehive stand just back of the Coddington School. The stand furnished tolerably good legs and framework. The top had been taken off and a molding table put thereon. With sand and images of continents we imitated the bees.

The committee said, "Three R's only," and I echoed it with the mental reservation that some day, please God, the children should have better nutrition than formal teaching. They should have the great book of the Creator, and learn from it that "Day unto day uttereth speech, and night unto night sheweth knowledge." A naturalist took the principalship of the Willard School. He brought specimens of stuffed birds. One day Charles Francis Adams and G. Stanley Hall were visiting the school. On request the principal brought in a stuffed duck which the pupils had never seen. I asked the children (it was the third grade) to write about the duck. They went at it with a will, and their slates were soon filled with good writing, correct spelling, and withal excellent thought. The visitors watched the work with interest. Mr. Adams turned to me and said: "You are teaching natural history." "No," I replied, "this is language." So it was, with a bit of thought behind it.

The criticism was made on all sides: "The children are amused and happy; they love to go to school; but do they learn? Can they spell?" And so on. Many of you may recall the Norfolk county examination. George A. Walton (no better man could be found), under the direction of the Norfolk school committee, examined the schools of the county, town by town. The examination was in the so-called essentials, the three R's, geography, and history. John Quincy Adams gave \$500 to have specimens of penmanship, number work, and composition lithographed. The results were published in a pamphlet. Figures gave the per cents, town by town. The towns were lettered A, B, C, etc., so that no one knew the particular town so lettered. The pamphlet created a sensation. Many declared that the examination was not fair. They were astonished at the results. Later on an edition of the report came out with the names of the towns given in full. Quincy had by far the highest per cent, and led in everything except mental arithmetic, and in that it stood third or fourth. This is the first time, so far as I know, that the foregoing statement has ever been made in public.

We learned that children may be happy, may love to go to school, may never have a prize, reward, or per cent, and still learn. In fact, the reason why students manage to escape knowledge is that knowledge and skill are made the sole aims and bribery the means of learning.

I might fill hours recalling the memories of Quincy and its schools, but to what end? The apparent success of the movement is easily explained. There was the opportunity, a faith, a spirit of work, an enthusiasm, to find better things for God's little ones. The outcome can not be explained by methods, devices, and systems, by tricks of the trade, or by particular ways of doing things. What we did in Quincy was nothing new; it came directly from the great authorities in education. What we did is now well-nigh universal; but the mere following of authority, however good, does not always count for progress; repetition of devices does not necessarily bring improvement.

We stand to-day at the beginning of an educational movement that means the salvation of the world, and its elements are faith, spirit, open-mindedness, and work. The teachers are not responsible for what wrong ideas may exist, nor can school committees be justly blamed. The common school was born of the people, it is supported by the people, and its faults are found in the people. The people must demand, and they will receive; they must knock, and it shall be opened unto them. We are bound by tradition, by mediæval ways, and deeply-rooted prejudice. The good that has been done is simply a foretaste of what is to come. Our ideals are low. The future demands an education into free government, a strictly American education, an education to meet the demands of these times, with their world problems that are weighing us down, and the ever-increasing duties of citizenship. I repeat, not by the guns of a Dewey or the battalions of Roberts or Kruger must these problems be worked out, but in the common school, where the quiet, devoted, studious, skillful teacher works out the nature and laws of life, complete living, and the righteousness that is to be.

---

### THE QUINCY MOVEMENT.<sup>a</sup>

[An address delivered at the celebration of the twenty-fifth anniversary of the beginning of the work of Colonel Parker as superintendent of schools, at Quincy, Mass., April 20, 1900, by Nicholas Murray Butler, now president of Columbia University.]

This is sacred educational ground. Around the shores of Massachusetts Bay the people's school has had its prophets and its martyrs. The nation's schoolmasters look back with affection to this rock-bound New England coast as the motherland of what they hold most dear. Here the makers of a commonwealth laid the foundations, steady and strong, on which a world has built. Here Horace Mann plead and exhorted that education might be real and that the public support of it might be both intelligent and determined. Here Eliot has finished an imperishable monument, more lasting than brass, which neither a countless succession of years nor the flight of ages can destroy. Here Parker first gained fame through service of childhood.

There is a letter of the younger Pliny to his friend Paulinus in which he insists that men should consider either the immortality of fame and work for it or the shortness of life and enjoy it. The Roman righteously preferred the former alternative. The modern sage finds the two not incompatible. He has banished asceticism as an incentive to virtue and enthroned a generous humanity in its stead. It is this humanity, broad, sympathetic, affectionate, which has given its fine emotional quality to Colonel Parker's work for children. One follows it not with the attention which is intellectual merely, but with the interest which is life. It bursts the bonds of convention and defies the trammels of tradition. It is real and vital. False ideals have often in the course of history made education an inhuman process. So it was in many schools of the Middle Ages, so it was under Sturm's dreadful curriculum at Strassburg, so it was a century ago when Pesta-

lozzi was bending every energy of his great soul to reach the hidden springs of child nature. It is a tendency of teaching to harden into routine. The routine in turn becomes mechanical, and intellectual and moral anæmia follows of necessity. From this there is but one possible escape, the tonic and stimulating influence of new knowledge. The university teacher seeks this knowledge in his library or his laboratory; the elementary teacher must find it in the child. Colonel Parker's work is human; its constant inspiration is the knowledge which the child reveals.

This human quality, together with a passionate faith in democracy, which is based as much on intuition as on conviction, is the surest clew to an interpretation of Colonel Parker's life and influence. He has not only seen but felt that education can not be permanently bolstered up by artificial supports. No patent methods or devices will suffice; not even the powerful force of legislation will make the educational stream run uphill forever. It must spring fresh and pure from the hearts and minds of the people if it is to be unfailing, steady, fertilizing. So Colonel Parker has labored in season and out of season to reach the people themselves, the parents whose most precious possessions are yielded up to the school and the schoolmaster for weal or for woe. He has tried to bring them to a realization of what education means in a democracy, of their responsibility for the character and standards of the schools, of their selfish as well as their public interest in the results. In the same spirit he has appealed to the teacher to open his eyes to the dignity, the influence, and the importance of his work. He has called upon the teacher to leave off being a merchant dealing in information and to prepare himself to become a builder of human souls. These things he has done in the name not of any theory, or school, or sect, but of childhood.

Appeals such as these, if insisted upon and responded to, are, in any stage of the world's history, revolutionary in their results. All practical affairs have their ruts, with a strong predisposition in favor of continuing to follow them. Are not these ruts the results of experience, and is not experience the great teacher? It depends, as the French say. There is experience intelligent and experience unintelligent; experience reflective and experience unreflecting; experience open-eyed and experience blind. The former is a teacher, the latter a slave driver. An unexamined life is not worth living, as Socrates insisted. So an experience unquestioned and untried in the light of eternal principles is not a human experience at all. It is the experience of the mountain top on which sun burns and storms beat; the experience of the cliff over which Niagara pours; the experience of the tides as they rise and fall in obedience to a law of which they know nothing, not even its existence. Human experience of the genuine sort is quite different from this. It is inquiring, progressive, illumined by a knowledge of principles. It faces the present and the future, and it uses the past without adoring it. In this wise Colonel Parker began his work at Dayton. He questioned his experience, but it was dumb. He did not speak its language. He did not know enough. The years of study which followed pointed the way to the answering of his questions. Education began to loom large in his field of consciousness; history hinted at its deeper lessons; philosophy suggested principles of action. The town of Quincy, and through it the United States, reaped the benefit of the revelation.

It was an object lesson of striking significance to see this veteran soldier, with a German university career behind him, putting forth all his newly roused energies in behalf of the boys and girls of the elementary school. The change in them was startling. "Going to school ceased to be a homesick tribulation," wrote Mr. Adams. "The children actually went to school without being dragged there. The simple fact was that they were happier and more amused and better contented at school than at home." What had happened? Only the obvious, it seems, as we look back at it now. Mr. Adams has described it graphically and

concisely: "Education was to recur to first principles. Not much was to be attempted; but whatever was attempted was to be thoroughly done, and to be tested by its practical results and not by its theoretical importance. Above all, the simple comprehensible processes of nature were to be observed. Children were to learn to read and write and cipher as they learned to swim, or to skate, or to play ball. The rule by which the thing was done was nothing; the fact that it was done well was everything." How sensible, yet novel; how wise, yet how revolutionary! From the vantage ground of to-day it is easy to see that Colonel Parker was merely putting in practice here at Quincy a few fundamental principles of education and of psychology. He was not devising methods or concocting ingenious devices. Methods and devices are small things and change with every individual who uses them. A principle is eternal and the parent of a hundred methods; but a cast-iron method is a principle's worst enemy. The teacher whose method is finished and complete has lost touch with human nature. Colonel Parker's principles have saved him from apotheosizing methods. It would show a truer appreciation of what happened here if we spoke oftener of Quincy principles and less often of Quincy methods.

Among cultivated persons there is a more or less widespread opinion that teaching power is declining. Our national journal of despair recently wrote this sentence in an important article on the decline of teaching: "No one, we suppose, will question that the number of great teachers is decidedly less than it once was, and that the depleted ranks are not being adequately filled up."<sup>a</sup> Without stopping to quibble about what is meant by a great teacher, I not only question the assertion, but deny it absolutely. There are more great teachers to-day than there ever were, and they are more widely distributed and exercising greater influence. It is true that the colleges and universities have not their fair share of them, owing to the passing influence of the lecture system imported from Germany, but even in those institutions there is more good teaching than there was a generation ago. The laudator temporis acti has in mind some one person whose loss he deeply feels, and generalizes from him alone. But north, east, south, and west teaching is constantly improving. It is based on more thorough scholarship, on stronger professional pride, or better special preparation. Where a quarter of a century ago there was one teacher who thought about teaching as such, and studied teaching, there are two score to-day. The Quincy movement was typical. Similar awakenings have come to hundreds of American communities, and he who runs may read the results. When the history for the spread of the new educational spirit comes to be written, Colonel Parker's contribution to it will be honorably remembered.

It was a wise saying of Emerson's that "it is essential to a true theory of nature and of man, that it should contain somewhat progressive." Colonel Parker's principles and insights have not stood still. They have ripened with the years and they have grown fuller and richer with use. A vast city has recognized them at work among its teeming thousands; villages and towns in near and distant States have caught them up and applied them with delight. They are not final; that would be their death. They are only an honest, courageous man's badge of service to his fellows and to his fellow's children. May he long be spared to wear it!

## COLONEL PARKER AND THE QUINCY SCHOOL.

BY WILLIAM T. HARRIS, LL. D.

[An address delivered at the celebration of the twenty-fifth anniversary of the inauguration of the Quincy movement, April 20, 1900.]

It is not often that a hero, at least in education, hears his praises sung; he usually hears plenty of dispraise from his contemporaries, and it is only the after generations that celebrate him. But it is more pleasant to recognize the services of one who is still with us, and even in the full career of his life work. Let us all hope that the just recognition of the services of Francis W. Parker will inspire him to still greater efforts under more and more favorable conditions.

In this brief contribution to the reminiscences and congratulations of this occasion it is well to recount the reasons which have led me from the beginning to place a high value upon the results of the Quincy movement, to esteem Colonel Parker as a man, and to honor his friends and supporters. The movement is a reform instead of a revolution. It reforms a practice widely prevalent throughout our land, which is pernicious in manifold ways. It attacks the slavish use of the text-book, which has been content to accept verbal memorizing without verification and without understanding. Instead of the method of investigation, by which the pupil is made to go over again the steps which led to discovery, instead of the method of criticism, which tests each item of knowledge and translates the new and unfamiliar by what is already in the experience of the child, there has prevailed the method of authority, which has prescribed for the pupil the implicit acceptance of dead results, and the adoption of opinions without insight into their grounds. That such a method is stultifying has long been known. It represses intellect; it represses individualism. The teacher is made a mere oracle and the pupil an humble follower; the teacher a fogleman and the pupils obedient repeaters. The freedom of the original discoverer ought to become the freedom of the teacher who sees again the light of the truth—and his freedom the teacher ought to make again the freedom of his pupils, enkindling in their minds the power of seeing the truth for themselves. The true method of the school is the method of enlightenment, which comes of self-activity and original investigation. The wrong method is that of oracular authority, blind obedience, dead results, and superstition. Unless the pupil is made active to interpret the new knowledge in terms of his own experience, the school produces mental slavery.

Again, as to the discipline of the school. Order is heaven's first law. But an external order procured by violence is not educative, except in the way of producing rebellious reaction in the pupil. Heavenly order comes from enkindling within the pupil the spirit of order—the spirit which cooperates with fellow-pupils and the teacher in producing a reasonable result.

Of all countries in the world, America is the place where the schools should stimulate the children to self-control—to the love of order for its own sake. And it is one of the great glories of the Quincy method that it has always laid full emphasis on this. It has proclaimed, as if from the housetops, the doctrine that the school must be a delightful place for the children, a temple of freedom, wherein each one adopts all that is done by others as the expression of his own completed will—his own volition rounded to fullness by the volitions of his fellow-pupils and of his teacher.

Let us call to mind the primary object of the school, and ask the question how the perversion of its methods arose. Certainly the object of the school has been correctly described as a means of giving to the individual the power to add to his own experience the experience of others—that of his race. At least it shall give the pupil the power to help himself to these stores of wisdom, and there is no doubt that writing and printing has preserved this wisdom and disseminated it.

The printed page holds the results of experience of the past, and it holds the recorded observations and reflections of the present. It enables each one who can read to possess himself of the thoughts and opinions of the wisest and best, near and far. No wonder that the school makes much of the printed page, and especially in the border lands of the world, the countries recently peopled by migration from the great European mother nations. The continuity of American civilization can be preserved only by the printed page.

The oral teachers, numerous though they be, can give very little to their pupils compared with what these can learn for themselves by knowing the art of reading.

In a border land it is far more important that every child should learn how to read than in old countries possessing all the monuments of civilization. Here every child must become eye-minded as well as ear-minded. He must know language quite as well by the eye in its printed words as by the ear in its spoken words. It is evident that eye-mindedness has a certain great advantage over ear-mindedness, because the printed page will await on the leisure of the reader and permit him to stop and ponder over a weighty sentence until it becomes clear as noonday, while the attention of the hearer—the ear-minded—must be on the alert, and jump from word to word and from sentence to sentence, at the mercy of the speaker, without pause. To stop and reflect is to lose the stream of discourse. So, too, if one fails to catch the meaning at once, he loses the thread of the discourse.

What is profound and technical can seldom be taught orally. The individual can not learn the results of science and deep research if he is only ear-minded. To the eye-minded alone comes the ability to master by his own effort science and philosophy and systematic treatises—as well as great literature.

To change a people from illiteracy to a knowledge of letters, from ear-mindedness to eye-mindedness, from dependence on the living teacher which only the few can afford to have, to that independence of personal assistance which comes through eye-mindedness, has, from the beginning, been the great object of the American school. But it has struggled under a load of bad methods. First, there was the theologic method, modeled on the instruction of the pulpit, which has always been that of unquestioned authority addressed to implicit obedience. This method has demanded the verbal memorizing of the text-book. This method has been opposed by nearly everyone of the educational reformers, and yet it still exists. It is the besetting evil, and the most natural one. Because of the importance of becoming eye-minded and of imaging the printed word instead of recalling the mere voice-symbol addressed to the ear, let the pupil go at the book indiscriminately, and he will be sure to become eye-minded. So thought the teachers of the past generations; so think the majority of the present generation. It is the first crude thought of anyone who reflects upon it. He does not see in his mind's eye the large percentum of children who are made to hate the printed page and to loath human learning by this injudicious method. Nor does he see that the majority of the remnant, who accept gratefully what the school can give, are arrested in their development at the stage of verbal memory, and never get to become thinkers and original investigators. The educational reformer is needed in all countries and in all times, but he is nowhere needed so much as in America, where the printed page has such an important function to serve. The bad method defeats its own end. Instead of producing that degree of intelligent eye-mindedness, that can at once recognize in the written or printed words all their delicate shades of technical meaning, the bad method produces graphophobia, or hatred of printed words, or a glib process of parroting—i. e., of catching words by external form without becoming interested in their sense.

How many good teachers have fought these evils in method? But among them all I know of no more earnest protest than that of the Quincy movement, nor of

any such series of fertile devices for the prevention of disgust for the book and of parrot-like habits as those that have proceeded from the prolific brain of Colonel Parker.

All of his energy is directed to prevent spiritual death in the teacher, which ensues upon adopting habits of formal prescription or habits of arresting the activity at any mechanical stage of progress.

To this is due the fact that excellent teachers have proceeded from his training school. They have shown themselves full of resources to create interest among their pupils and secure enthusiastic self-activity. If a book could be filled with an account of all these devices, I believe it would be the best book of all those that have proceeded from the educational reformers. For most of those books have been negative—tearing down the existing pedagogy without offering an equally good system in its place. Colonel Parker, as we all know, is fiercely destructive of what he considers pernicious in school methods, but he is full of help for the novice or the unskillful, bringing both hands heaped up with ingenious devices to awaken interest and furnish enlightenment in those studies where dryness and dullness had prevailed before.

The public school has been much blamed for its discouragement of individualism among pupils. It is claimed that all its products are on the same pattern—machine made, like so many pins made by the factory.

I think, however, that the account of themselves given by our citizen soldiers educated at the common school does not show a lack of resources. Nor do our pioneers who go to the mining regions of the borderland compare unfavorably with adventurers from other lands in respect to their ability to govern themselves and overcome obstacles of nature. In fact, the versatility of the American pioneer always attracts attention and praise. See how the school aids in its development.

There are two ways of developing individualism. First, there is willfulness and opposition to established authority. Individualism of this kind does not lead to a rational life. It sets itself against the social whole, and society is obliged to crush it for the benefit of the public peace.

The second mode of developing individualism is by gaining power over the community, by learning to understand its motives and purposes, and learning the best means of helping their attainment. He who would be chief among his fellows must be the servant of all—that is to say, the one who aids the whole to its well-being.

In the school the child learns how to understand science and the conquest over nature by mind. He learns to command the service of nature, and this is one part of a healthy individualism. He learns, moreover, to understand human nature by the study of literature and history, for literature is wholly devoted to showing how mere feelings grow to clear ideas and to deeds. Individualism is, therefore, powerfully developed by the good school. It is strange to think of it, but it is true that the large school furnishes a better place for the development of individualism than the small school, for the large school must necessarily have a more carefully devised system of regulations in order to prevent the individual from colliding with the social whole, and the pupil comes to know how to get along without being crushed by his fellows, or, on his part, furnishing stones of offense for others. He has a better opportunity to study the art of combining one's fellow-men for reasonable purposes.

The child who has attended a good school has learned much of human nature, and, if it has gifts that way, has found means to learn how to govern others. It has acquired directive power. This is really a development of individualism. The frontier settler shows individualism in combating the obstacles of nature, but the boy or girl in the city that learns how to combine fellow-pupils and sway them shows a far higher degree of individualism.

The best thing that can be said of the Quincy movement is that it tends to create a healthy individualism among the pupils of our schools.

Small as it is, the schooling given by our nation to its people, some five years apiece, it suffices to make reading and writing universal, and with them also a limited acquaintance with the rudiments of arithmetic and geography. This is a beginning of eye-mindedness, which will grow throughout life by reason of the fact that everyone in this country becomes a reader of the daily newspaper. This is an important matter, and we can see it if we turn off our attention from the obvious evils of bad newspapers and think on the inevitable good that a newspaper civilization brings with it, for a newspaper civilization is one that governs by public opinion. No great free nation is possible except in a newspaper civilization and with government of public opinion rather than of a police system, for the newspaper creates public opinions and then makes it the ruler. It makes eye-mindedness forever necessary for all citizens. Thus the school suffices to produce a government by public opinion. Every citizen who reads the newspapers spends a portion of each day in contemplating world events and in discussing them. Thus each eye-minded person lives an epic life in the age of newspapers. The school likewise enables the citizen to readjust his vocation in an age when the industries that deal with the production of raw material are needing fewer laborers, and the skilled industries that manufacture these raw materials and transport them from the places where they are not needed to places where they are needed are demanding more laborers. The school enables the workman to learn how to direct a machine to perform his drudgery.

Great is the function of the elementary school in our civilization and blessed is he who improves its quality of instruction and brings in more humanity into its discipline and management.

---

## AN ACCOUNT OF THE WORK OF THE COOK COUNTY AND CHICAGO NORMAL SCHOOL FROM 1883 TO 1899.<sup>a</sup>

By FRANCIS W. PARKER.

It may not be out of place for me, at this time, when I sever my connection with the school, to sketch briefly its inner evolution—how it rose from weakness and crudeness, by a zigzag route of experiments, failures, and successes, to the partial realization of a great ideal.

### THE FACULTY.

The history of a school is the history of its faculty. The Cook County and Chicago Normal School is no exception to this rule. Dr. John Dewey says: "The school is society shaping itself." The function of the teacher, then, is to make life, society, the State, the nation, what they should be; and the function of a normal school is to train men and women for these duties, which are indeed higher and more important than all others. A normal school should have a much broader scope than the training of teachers; it should be a laboratory, an educational experiment station, whose influence penetrates, permeates, and improves all education and educational thinking. Hence the faculty of a normal school should consist of the very best teachers—best in education, best in culture, best in professional training, and best in experience.

---

<sup>a</sup> Reprinted from the Parker memorial number (June, 1902) of *The Elementary School Teacher and Course of Study*, University of Chicago Press. An explanatory note by the editor of that periodical says: "This account of the normal school was written by Colonel Parker in the summer of 1899, soon after he had left the normal school to become president of the Chicago Institute. It was intended to form a part of the report of the city superintendent of schools. It may be taken as a brief but perhaps the best portrayal of his work in connection with the normal school that has yet been written. This is the first time it appears in print, this memorial number being thought a fit place for its publication."

It may be frankly admitted that our faculty did not reach this high standard of excellence. The best that can be said is that we fully recognized our immense responsibilities, and strove faithfully and earnestly to meet them. With us a faculty means a body of earnest, devoted students of education, who believe that human progress is coordinate with educational progress, and that human progress depends upon education as its fundamental and intrinsic factor.

Not to understand the history of education and, through it, all that has in the past been done for schools; not to know its reformers, its heroes, who bravely and wisely fought battles for the masses; not to be cognizant of the very important and interesting educational movements of the present day, would have been proof positive of our inability to grapple with the problems of education. But gratefully recognizing the wealth of knowledge, experience, and method which the past has brought, and comparing the achievements of the past with present human necessities and possibilities, it seemed to us true that education as a science was in its swaddling clothes; that genuine educative work in the schoolroom was comparatively meager; that the cause of this inefficiency sprang from the low grade of demands made upon the pupils; that the systematic cultivation of selfishness through bribery by means of rewards and per cents, and the improper stimulation by promotion, were immoral and often rendered nugatory the best efforts of the teacher; that education, as it was, aimed, for the greater part, at the development of verbal memory, with too little regard for the evolution of thought power; that the training of the will was left in abeyance; that the children had little opportunity to choose and execute for themselves; that their reasoning power was not appealed to through the imposition of responsibility; that education was too often mental and moral starvation; that the needs of the body were neglected; that the mind content was sacrificed for vague word images; that the moral power was not strengthened as it should be, owing to the lack of proper opportunity for moral action; that the common schools were not adequate to the demands of self-government; that vast sums of money and much toil and drudgery were being expended for schools, with very scanty results; in short, that education left much to be desired, and that by the proper means it could be infinitely improved.

This arraignment applied generally, though there were, it is true, many bright spots all over our land. Thousands of teachers were earnestly and honestly searching for that which would make education more rational and effective.

We went to work with enthusiasm and earnestness, determined to solve some of the immediate and pressing questions of school economy. Once a week, for two or three hours, we met to discuss questions that were forced upon us by our daily teaching and training. Every teacher was required to explain his teaching and give reasons for it. He was also required to criticize all the instruction and plans of order that came within his observation. He was asked to present suggestions, new plans, and devices which, in his opinion, would improve the school. When the printing establishment became available, each teacher made out a syllabus, which was printed and distributed for study and discussion at the faculty meetings.

The regular faculty meeting was by no means the only meeting. The heads of departments held many conferences, and the grade teachers had their meetings to discuss questions of daily work.

Each teacher was expected to penetrate and permeate the whole faculty and the whole school with the intrinsic value of his subject and its relations to all other subjects, and to discover in what manner his specialty might enhance the value of the rest of the work. Our aim was to establish perfect unity of action, consistent with the greatest personal liberty, recognizing that personal liberty is the one means of making the individual of worth to the mass. There was much friction and earnest and prolonged struggles, which were reconciled in the outcome

by oneness of purpose. Constant change, elimination, innovation, experiment, tentative conclusions—this was the manner of progress.

The teacher of teachers should be a great teacher in every sense of the word. He should be an earnest, devoted, open-minded student of education, with unbounded faith in possibilities; a person of marked wisdom, ready to abandon the useless and to adopt the useful; one not chained by prejudice or controlled by caprice; a person who "inherits the earth" through meekness and willingness to listen and understand, and who has, at the same time, the firmness and courage to withstand wrong public opinion and personal influence. The one thing, above all, by which the teacher of teachers exerts a powerful influence is the spirit in which he works. If he betrays a genuine hunger and thirst after righteousness, if he shows meekness and open mindedness and an overmastering love for children and all mankind, then his spirit passes over to the students and inspires them to do the best work of which they are capable.

Actual teaching is the culmination of the teacher's profession, but it is by no means the main or the most difficult part of the work. Finding and arranging subject-matter for the mental nutrition of every pupil and for all grades of pupils is the problem of problems. Old as most subjects are, the subject-matter of the fundamental thought-nourishing studies is quite new. Physiography, geology, biology, and other subjects of nature study present almost entirely new phases in the field of learning. Nearly all the eminent discoveries in the realm of science belong to the second half of this century; indeed, most of their inventors are still living, and some of them are comparatively young.

Knowledge in itself is one thing, and knowledge pedagogically arranged is quite another. The adaptation of both to the learning mind comes within the broad range of the teacher's art. An efficient normal school teacher not only discovers and arranges the facts of his subject for his immediate students, but for the city, the county, the State, and the nation. He must be a close student of his subject and be familiar with all the latest discoveries in his field. He must, to a certain and reasonable extent, verify his facts and then adapt them by a continued and continuous study of the children.

If a normal school teacher is burdened with many recitations, if he is obliged to teach various subjects, his energy is overtaxed, his time for study and research is lessened, and his work is weakened in every direction. As a result of over-pressure he loses freshness, vigor, and enthusiasm. These facts are presented in order to explain that as a faculty we were too often restricted in our efforts by overwork and by the struggle to expend energy in teaching for which, in the very nature of the case, we could not be adequately prepared. As the work of the school progressed this difficulty was in some degree overcome. It is not easy to convince even an intelligent school board that the number of hours a teacher spends in the schoolroom is by no means the measure of his work.

This is a very brief and imperfect sketch of the duties and functions of our faculty as they presented themselves year after year of transformation "in the newness of light." Some of the faculty passed over, some left the school to assume other duties, while new ones came in to reenforce us. In June, 1899, there were two who were members of the faculty January 1, 1883. One of them had been a teacher in the Cook County Normal School six years when I took charge of the institution. I have never known a faculty so devoted, so earnest, and so self-sacrificing. I trust that some day its history may be written and published under the auspices of the alumni. In such a volume would be found the life record of some of the heroes and heroines of education.

The foregoing, I trust, has prepared the way for a description of our work.

## THE PRACTICE SCHOOL.

Without the practice school we could not have taken one practical, efficient step in the education and training of teachers. To the faculty the practice school furnished an indispensable means of close and careful study and investigation. Unapplied theories—and the world is full of them—are of little use. They float peacefully in the upper air, a sweet consolation to unpractical souls. "Faith without works is dead." We decided that every well worked-out theory which met with general approval must have its final test in the schoolroom. In discussion each teacher's opinion had the corrective check and criticism of every other teacher. No plan or theory entered the practice school in slipshod fashion. The whole faculty watched with critical eyes every new movement, and fresh discussions followed. In this way the faculty concentrated all their efforts upon the care, treatment, training, and teaching of children.

Most members of the professional training class had had during twelve, sixteen, or more years little or no practical use for the knowledge they had acquired. Knowledge to them had meant passing examinations—gaining per cents and promotions. The stimulus of definite purpose, a feeling of the intrinsic function of knowledge, rarely had been theirs. Moreover, a large majority of the students were soon convinced by experience that their stock of knowledge was exceedingly scant for use in teaching, and that their skill also was far below the demands of their pupils. In the practice room they were brought face to face with the problems of teaching. Learning now had for them a very practical use. A hunger for righteousness was created, and this became the special teacher's opportunity. The students, under the pressure of a genuine demand, began to study as never before.

It is needless to say that the more a student knows and the stronger his power to study the better he is prepared to learn the art of teaching. We met, however, in a prescribed one year's course, not a theory, but a condition. The best way to meet that limitation was to set the students to work in the practice school, under the most favorable circumstances.

The practice school has one very important function. It is, if efficient, an influential object lesson for the teachers of the city and the county, and for the parents and the public in general. It proves that there is a science of education and an art of teaching, and that that science and that art mean everlasting progress, mean economy of personal energy; it proves that knowledge and skill are means for the development of character. Under present circumstances it is not possible for other schools to do the work of a properly managed practice school. The practice school is the real center and core of a normal school. It requires the most careful attention and study on the part of the entire faculty. I maintain that our practice school was a far better school for children than schools in general. The preeminent advantage of a good practice school is the individual attention and teaching made possible for all pupils.

On January 1, 1883, the practice school consisted of two rooms and one regular teacher. One room was managed and taught in turn by the special teachers. There was no appropriation for this department. Later, District No. 10 made the practice school one of the regular schools and paid the county \$1.25 per month for each pupil on the roll of average attendance. The income from this was not enough to support an efficient school.

We found that the position of practice (critic) teacher is in many ways more difficult to fill than that of special teacher or even that of department head. The practice teacher must teach and criticise as the students practice month by month in her room; she must see that the practice teaching is a genuine reenforcement of her own work—that the largest amount of good is done. The subject-matter pre-

pared by the department heads must be adapted by the special teachers month by month to the actual needs of her pupils. She prepares the monthly programme for printing, and examines with great care the teaching plans presented by the training classes. It is no disparagement to say that many of our practice teachers were not equal to this exacting task. For a long time the limit of the salary of the practice teacher was \$40 per month.

I have described the practice school for the purpose of explaining the work of the faculty and of the professional training class as well. The entire work of the school was concentrated in practice teaching. The study, experiments, investigations, the training in expression under all its modes, were direct preparations for teaching. The needs of the pupils in the practice school were the guides and incentives to all-around preparation. The critic teachers, as heads of grades, had immediate charge of the practice classes and, at the same time, of the classes of pupil teachers as they came monthly, class by class, under their charge.

The heads of departments and the special teachers studied the needs of the grades and made out the courses of study in their respective subjects. They consulted with the critic teachers as to the kind and the arrangement of subject-matter and the details of exercises in expression. They gave lessons in the practice school, in order to keep close to the central problem. Every lesson to the normal classes was preparation for the practice work. Each and every member of the faculty taught the psychology, pedagogics, and methodology of his subject or subjects. The function of the department of psychology, empirical and physiological, was to criticise, unite, and correlate all the work of the school.

The members of the professional training class were required each month to furnish teaching plans. These plans involved the subject-matter to be used in teaching, its arrangement and adaptation to the respective groups, with suggestions of methods and devices. Illustrations were presented in the plans by the different art modes of expression. The plans were thoroughly examined by the faculty, and either "approved" or "disapproved," the former meaning that the plan might be applied by the author, the latter that it must be rewritten.

The practice school was divided into forty or more groups or small classes, so that as many teachers could teach during one period. The afternoon session was usually devoted to practice. In three periods 120 members of the training class could give lessons. The entire faculty watched with care, each in an assigned station, the practice work, making notes for personal and general criticism.

The normal classes moved up or down each month, to give each class an opportunity to teach successively for one month in all the grades. The basis of judgment as to progress, promotion, and graduation of students was the character of their work, culminating in their ability to control and teach pupils in the practice school.

Pupils in the practice school were promoted from group to group and from grade to grade whenever in the judgment of their teachers they could do better work, and therefore more good in the next group or grade. This plan required continued watchfulness, a deep insight into character, and a very careful exercise of the power to judge correctly and justly. By this plan the student or pupil was made to feel that his future was in his own hands, that he must "work out his own salvation." Quality of work, mental, moral, and physical, was the criterion.

#### DISCIPLINE.

From the inception of the work, we were aware that there were very grave difficulties before us. Corporal punishing, fear of which was for ages the stimulus to study, had been generally abolished. The substitute for it has been and is mainly a system of per cents, credits, and promotions, based on the lust for

rewards, the system of marks of quantities of knowledge supposed, and only supposed, to have been acquired. This pernicious scheme of bribery is in reality the systematic cultivation of selfishness, the controlling and root vice of humanity. Its use, in effect, emphatically denies that pupils have any substantial enjoyment in the acquisition of knowledge and in the exercise of skill in expression. Bribery is the line of least resistance for the teacher in keeping the body under constant repression and in stimulating the mind to startling vagaries—startling if they were understood. The stimulus of credits keeps the boy in his seat; per cents induce him to memorize words.

We abolished the whole system of rewards. This reform was a radical one in every respect. Children must have something to work for, else there is no work. A child fed on per cents often thinks of little else in school, and cares for nothing more so far as education is concerned. It is true that per cents do not drag many pupils down, for an aim is as necessary for the child as for the adult. "Ideals determine all efforts of the will" is an axiom. The problem was to find an end, an aim, which would be a high, strong, ethical stimulus to child action, an aim definite in the pupil's mind, an aim that would control his will and inspire his best efforts.

Character, of course, is that end; but "character" is a vague word, unless translated into concrete terms of action. Such terms are found in the true meaning of citizenship; and the qualities and duties of citizenship are interpreted by the needs of community life. Very slowly our investigation led to the truth that must control the future education: "The ideal school is the ideal community." Working under the ideal of citizenship, we found that the feeling of responsibility, the dignity of belonging to a community, the desire to be personally recognized as of some use, and even of importance, were profound and controlling ethical stimuli for all grades of children, from the kindergarten to the higher schools—stimuli that increase in power as duties come, as insight is gained, as right motives are developed. Arbitrary government grew slowly into self-government, the order of assembled souls, the order of duty, of obligation, of free will. Work, study, exercise, play, came into each day as necessities of life, as daily bread.

The reform was accomplished very slowly; indeed, its present status may justly be called only a good beginning. But enough has been done to prove that the ideal is right, though the way of attainment is long and arduous. The history of the school, if written, would be an account of the disruption of the ideal that the acquisition of knowledge is an end in itself, and of the practical beginnings of the new ideal of education—citizenship, community life, or complete living.

Knowledge is to the mind what blood, breath, and food are to the body; without knowledge nothing can be done. But there is an immeasurable difference between knowledge as an end and knowledge as a means. Citizenship demands fullness and richness of knowledge, but it also determines the kind and the nature of the truth to be applied through self-expression or skill. The value of knowledge can be apprehended only through its immediate use, and its appreciation is the highest stimulus to action.

It is not easy to change the ideals of pupils whose minds have been soaked in per cents, before whose eyes glitters the bauble of reward, and whose school habits are rooted in competition. Very much more difficult is the task of proving to teachers that knowledge, as an end in itself, is a fetch, on a par with the mysteries and tricks of the medicine man. The ideal of community life, full and complete as it may be, is a vague thing to teachers whose lives consist in preparing for examinations. But the supreme task is to convince parents and the people that the old plan is utterly wrong. Parents in general measure the school progress of their children by per cents on monthly report cards, by text-books finished, examinations passed, and promotions gained. Rooted and grounded in the

minds of the multitude is the idea that knowledge is the one standard of the school, and that the quantity of learning may be accordingly measured in figures. A delegation of mothers waited on me in the spring of 1883 with an urgent plea for the retention of the monthly report card. The figures of the teachers were to them the only indication of the value of the school. Their ideal consisted of certain quantities of knowledge learned within a certain time, coupled with a "behavior" equal to economical efforts in word memorizing. This ideal was the immediate cause of much bitter opposition to the work of the school, opposition which sprang from very honest opinions drawn from tradition. Opposition was expected, and it was met in the only effective way. The true test of the school is to be found in the development of character. If pupils grow strong and skillful in body; if they become helpful in habit, and thoughtful in their help; if they grow in trustworthiness, in refinement of taste, in moral and mental power, then the school is good. If otherwise, it is worse than useless. When parents found what the school really meant, their opposition changed to enthusiastic support.

#### THE KINDERGARTEN.

The nearest exposition of the new ideal which we held was the kindergarten. Froebel put it into active practice with little folks, the ideal of social life.

Before 1883, Cook County Normal School had had a kindergarten for a few months. The Chicago Froebel Association supported our second kindergarten by paying the salary of Mrs. Alice H. Putnam, the pioneer of Froebel's ideas in the Northwest. From 1883 a kindergarten has been continuously maintained as an essential factor in the school. It became a free kindergarten when the school was transferred to the city.

Froebel was the pioneer of the new education, the education of complete living. Far above his methods, gifts, mother play, and the precious details of his epoch-making work, stands preeminent his ideal of life. He fully recognized the child as a social being. He believed that the action and reaction of child upon child, of the individual upon the mass, and of the mass upon the individual, were the keynotes to human growth. He saw clearly that opportunities for doing good were the prime necessities for the formation of right habits. In his comparatively short kindergarten activity, though opposed on all sides, he gave to the world one lesson, a lesson of incalculable value, the right treatment of little children.

However, his principles reach upward and onward into all education. To us the kindergarten has been the inspiration of all our efforts. Here we learned that the teacher is an organizer of community life, and a creator of correct public opinion. Here very often we saw a little one, controlled utterly by selfish motives, changed through the influence of public opinion into a model citizen, ready to do his part for his associates. Every member of the faculty, especially the critic teachers, over and over again testified that pupils from the kindergarten might be traced through all the upper grades by their self-control, their desire to be helpful, by their ready skill, spontaneity of action, and power to study. The ideal of Froebel became the ideal of the school.

#### MANUAL TRAINING.

Handwork, which is now fully accepted in Chicago and elsewhere as an important means of education, had had, in 1883, a feeble beginning. Three or four technical schools in America had introduced it as a means of trade learning; there were high schools that had established manual-training departments, and two private schools had begun sloyd as a means of education; but in the public elementary schools there was scarcely a trace. Thoughtful people who had studied the kindergarten were beginning to have a suspicion that the desire of children to construct and create springs from the deepest and strongest instinct.

Without "chart or compass" we established a manual-training department in connection with the practice school. Charles H. Ham and Col. Augustus Jacobson, through whose efforts and the financial assistance of the Commercial Club the Chicago Manual Training School had been established, were no less zealous in assisting the Cook County Normal School to initiate a course in handwork. In September, 1883, a few rough carpenter's benches were put into a basement room, and tools bought. Dr. George W. Fitz, now professor in Harvard University, took charge of the department. It soon became an organic part of the school work, and as such has continued ever since. It has grown with the school, ever becoming more important, though always crippled for want of money and room.

My first experience of genuine spontaneous attention was the sight of the first class at work with saw and plane. Boys and girls have worked together from first to last, and it would be difficult to say which have done the best work. Our experience in manual training has always been delightful and instructive. The pupils, too, with scarcely an exception, have greatly enjoyed their handwork. When we put the little children from the first grade into the sloyd, they seemed to find a new richness and beauty in their lives; and it was by no means a fleeting pleasure aroused by a novelty, for during their eight years of handwork their pleasure constantly increased. In sixteen years, with continued use of tools, there never has been an accident worthy of the name.

At first we were at our wits' end to find something for the children to do, things for them to make; but this state of affairs did not continue long. Nature study and history soon suggested innumerable articles for use. The demand for apparatus for the study of physics, chemistry, biology, geography, horticulture, and arithmetic gradually filled the sloyd shop, and then the laboratories and class rooms, with articles immediately useful in study and experiment. Manual training became interwoven with all subjects of study. It was the custom of the children to make useful articles for Christmas presents, usually for their parents. It was a delight to observe the intense interest of the workers; how cleanly, neat, and exact they were; how persistently, in and out of school hours, they stuck to their self-imposed tasks; and how, when the walls of Assembly Hall were lined with the beautiful products of their brains and hands, they proudly presented their gifts to their parents and friends.

Every graduate of the grammar school was able to do good cabinetwork. This, however, was a slight indication of what handwork had done for them: muscles developed and coordinated; nerves stronger and steadier; minds disciplined and hearts made happy through the feeling of usefulness. It is notable that the foremost workers in sloyd were foremost in all other school work. We found that the shop was an excellent sanitarium for weak nerves and other defects.

#### NATURE STUDY.

It was our good fortune to take the initial steps in subjects that have since become of general application. The great book of nature, God's infinite volume of everlasting, inexhaustible truth, had had scarcely a place in the courses of study in American schools. True, science had entered some schoolrooms through the usual text-book methods of learning facts, or supposed facts. Here and there was a touch of laboratory work, which was, however, treated as something far from the organic work of the schoolroom. Scientists were pouring out stores of new-found knowledge; but the introduction of science brought additional burdens, instead of blessings, to teachers who were preparing their pupils for examinations to test their knowledge.

Nature must come in as mind nutrition, the means of soul action. The general theory seemed plain enough. Food, clothing, shelter, comforts, luxuries, means of transportation, the means of sense and æsthetic enjoyment, come from nature.

The great, throbbing world of man is full of nature's products. The universe is God's manifestation of himself to his children. Creation is going on everywhere, in earth, air, and water. Which is better, a job-made text-book, or God's writing on and in all that is?

The question was: "How may nature be adapted to growing minds, to hearts that have loved and lived in nature until, indeed, they entered school?" We must confess to experiments, failures, and almost despair in attempting to adapt to human needs that which seemed so grand and beautiful. Everywhere in the initial experiments was the blindness of the knowledge motive. "Things must be learned thoroughly;" and a natural object was taken, examined, dissected, painted, drawn—exhausted, and the interest of the children exhausted at the same time. Another way must be found. Prof. H. H. Straight, a pupil of the great scientist and educator, Agassiz, entered upon the work in 1883 with boundless enthusiasm, which all too soon burned out his valuable life. He was a man of large vision, a prophet in very truth. It was found that mere laboratory work was not close enough to the children; nature refuses to be viewed in bits and rags. A leaf or a twig would not do; the child must have the whole tree, with the land around, or still better the forest. Field excursions with their wealth of observation were early introduced. Woods, swamps, and the lake shore were investigated with pencil or brush in hand.

Failures in nature study, failures that were, however, prophecies, were the rule, until Wilbur S. Jackman in 1889, undertook to grapple with the problem. The idea of thorough, exhaustive work was abandoned. The phenomena of the "rolling year" were taken as the general guides; the child was brought into loving contact with nature; the subjects were adapted to different stages of child growth; art and nature were correlated.

We have taken a step, and only a step, in the inexhaustible book.

#### GEOGRAPHY.

Geography has been and is for the most part the memorizing of a conglomeration of unrelated statements. Out of mists and semichaos Ritter and Guyot have brought the knowledge of the earth. Geographers and geologists now living have taken an immense step in advance. It is now possible to arrange the subject in pedagogical order for adaptation, by teachers, to grades and to individual conditions. This task seems stupendous when we take into consideration the vast extent of knowledge from which the intrinsic may be selected. Physiography deals with the forms of the earth's surface, the structure of man's home; geology, with the history of that surface; meteorology, with the climatical environment of man; political geography enters directly into the study of man in his present conditions of social life, commerce, arts, progress, education.

There are in reality but two all-embracing subjects of study, nature and man. Geography unites these two subjects. One subject explains the other; without nature man is nothing; without man nature is useless. Physiography, the intrinsic portion of geography, is new to the world and very new to common education.

Images of the earth's surface are indispensable to a knowledge of all the closely correlated subjects, indeed to all subjects of study. This necessary link was early an exceedingly interesting subject of investigation. We were driven to the field for answers to our questions. No text-book could take the place of the actual objects. We found marks of creation everywhere—glaciers had done their wonderful work, rivers were slowly sculpturing the earth's surface. Scientists in universities had found treasures in field work. Why should children wait for the last steps in their education before coming into contact with the richness and beauty of God's open book?

There is no better sign of the weakness of education than unjust and unwise discrimination between a text crammed with condensed statements and the original sources of truth that everywhere surround us in infinite abundance. There is only one explanation of the comparatively fruitless course, and that is: Knowledge as an end demands facts or statements condensed and arranged in logical order, which, in their adaptation to the needs of growth, are in the highest degree illogical and unpedagogical.

This explanation is made to show how gigantic problems arose at every step and on every side. To follow the quantity plan of learning would have been very simple and easy; the way was well known and well worn. The majority of the people were satisfied with the signs of knowledge acquired; the high schools measured results by the number of facts acquired. But the fact remained that there is an immeasurable distance between knowledge as such and character. The right knowledge at the right stage of development is nutrition; when carried into action it is self-expression, the manifestation of character. It is the question of daily bread for daily needs, infinite in possibilities.

There is the food—inexhaustible; here the child, his soul crying out for nourishment. Where is the teacher?

#### MAN.

There are, as I have already said, but two subjects of instruction—nature and man. These two subjects are a perfect unit in origin and purpose. History is an imperfect record of man's life, filled with facts, prejudice, fancy, and falsehood. Man, as a subject, is larger than history, comprehending, as he does, anthropology, ethnology, archæology, philology, and a long series of sciences united in philosophy.

History, properly taught, may assist in the study of man; but man is the central subject of a child's observation from the first breath to the last. He is full of experiences of life when he enters the schoolroom. He commands the teacher to go into higher experiences and deeper inferences. This means a never-ending study of man and his works in our great city. Manufactures without end, covering an immense range of human industries; business, commerce, social life, crowd thick and fast upon us. Here again arises the question: "Shall the child get his knowledge of man from meager statements in condensed pages, or shall he come into genuine physical contact with the great arteries of trade, with the life all around of building and making—the paving of streets, the building of bridges, and all the vast and varied activities of a great city?"

Our experiments prove beyond question that all children have a deep and abiding interest in these things. Two hours in a great rolling mill means a genuine and profitable study of history. Such a study prepares children for the story of the great industrial developments. They are ready to appreciate great inventions and to reverence the inventors. They observe men at work; they feel the value of work, and honor labor. The citizen should know something of the world in which he lives, and this knowledge comes best from actual contact. Again, there is the thrilling history that the newspaper brings us. The geography of Cuba, of the Philippines, or the Transvaal, makes contemporary history interesting and profitable. Education should prepare one to study, to understand, and to appreciate the life on our globe that now is. Manila leads back to the great Armada; the present state of man is the outcome of the past. The railroad bridge near the schoolhouse is a very complicated structure, the evolution of centuries of bridge building. Observation of that bridge leads to the question of how primitive man made bridges. Without discussing the vexed question of racial culture, experience shows that the delight children take in the life of primitive man, in early

homes, in houses, weapons, utensils, art, is universal. Thus evolution means to them the evolution of the tools, homes, the furnishings of man.

Myth is the beginning of history, and every child goes through a stage of myth life. Spiritual life in history has its roots in myth, and the same is true of the child. Literature is the beacon light of history. Miss Rice, head of the department of history and literature, made out course after course and programme after programme, all of them tentative but profitable.

That man's life may enter and influence the child's life as daily bread is a possibility which opens great vistas of educational progress, fraught with deep significance to humanity.

#### CONCENTRATION AND CORRELATION.

A body of teachers working together honestly and earnestly for the good of children will be sure to find something better at every step. The best in educational principles that we as a faculty have found may be summed up under concentration and correlation.

Pedagogical concentration is the bringing to bear of the will, the reason, and of all that makes up personal thought and energy, upon character building or citizenship, as the end and aim of education. Concentration is reinforced a thousandfold when an entire faculty unites for one purpose.

Citizenship, or its correlative, community life, demands that knowledge and that skill which make the social life of each as full and as rich as possible; it demands that work and play which the little community needs day by day. Nothing can be done without knowledge, and the problem is: "What knowledge does the class or the school need for the best life?"

Selection on this basis from the vast stores of knowledge is of paramount importance. The selection of subjects of study is not hedged in by the formal classifications of knowledge; indeed, correlation means the breaking down of the barriers of classification. To illustrate: When a tree is a subject of study it should be observed in its entire environment of earth, air, and water. Thus geography, meteorology, and mineralogy converge in the study of one object. Perhaps the best way to illustrate correlation is by contrast. Knowledge, as an end, seems to make the isolation of subjects a necessity for the acquisition of certain quantities of knowledge in a given time. Therefore, in departmental teaching, subjects as closely related as geography and history, or botany and mineralogy, very often have no relation whatever in the minds of students. The tendency in knowledge getting has been classification into subdivisions, the splitting up of topics or subjects. It is a simple psychological fact—indeed, it is common sense—that the strength of a thought lies in its relations. The unfortunate struggle to pass examinations has suggested the device of compacting and isolating subjects.

One of the first mental processes that attracted the attention of the faculty was that of reading. The line of discussion was somewhat as follows: "Reading is thinking, imaging. It should therefore always have a content of educative thought. The observation and study of man and nature furnish the mind with growing images. Reading expands the images and brings them together in a unity. Is it possible to make reading educative at every step? or, in other words, can reading be made from first to last a potent means of synthesis and reflection?" Then arose the crucial question: "Is it possible to teach children the art of reading and at the same time hold them to educative thinking?" We were teaching nature, geography, history, literature—subjects full of interest—to which reading could be correlated. The theory stood the test, and one step in correlation was taken. The time given to learning to read became time given to study.

Spelling, the incubus and bugbear of school, came in for consideration. Is it possible to learn to spell and at the same time express educative thought by writing? Articulation, enunciation, pronunciation, and idioms are acquired by the expression of thought. Why not the correct form of written words by an analogous process? From first to last the nutritive subjects of man and nature demand an immense amount of expression by means of the pen. Writing has the tendency to unite images, to quicken thought power, and to strengthen memory. All writing should be correct in verbal forms. Is it not possible to learn to spell while expressing thought in writing? If this question can be answered in the affirmative, how much valuable time may be saved!

Long practice has shown that these questions may be answered in the affirmative. There are now and then failures in teaching children to spell on the plan of correlation, but such failures may be charged in general to defective teaching or to neglect to do the right thing at the right time.

The doctrine of Delsarte carried us another long step in correlation. Mrs. Parker taught that kind of elocution which trains the body to be immediately responsive to the soul. Oral reading is the direct motor discharge of thought and action, enhanced by the action of the whole body. Thus speech, including oral reading, and thought may be correlated. This seems simple, yet we all are painfully aware that elocution has been to many the training of the voice, wholly isolated from the images in consciousness.

If childlike spontaneity may be continued and maintained in speech, why not in writing, modeling, painting, and drawing? Art, so called, has entered the American schools under the plea of industrial necessity. It came with the stiffest formalism behind it, was isolated from all earthly things, and its use neither the teacher nor the pupil could understand. It consisted in copying copies or in drawing meaningless models. It is absurd to call this art. It never made an artist or cultivated a love of art.

Expression has three functions, physical, mental, and moral. It trains the body in skill, reacts on and strengthens consciousness, and, above all, makes expression an immediate means of genuine thought manifestation. The higher the purpose the greater the stimulus to the exercise of the body and to the enhancement of mental images. This is true only when soul, mind, and body act as a unity, the end controlling action; motive, image, and self-expression following each the other in immediate succession.

The above statement was the outcome of many long discussions, which were followed by experiments and trials. When we were teaching nature study, geography, and history, speech and writing were commonly used modes of expression. To these were added making, modeling, painting, and drawing. Each mode of expression had its special relative function. The question that came up again and again was: "Is it possible for pupils to acquire adequate technique in art through the exercise of skill under the immediate impulses of educative thought?" The answer came slowly all along the line: "Thought and expression need not be divorced. Expression will grow with thought, and thought with expression. Under good teaching, it may be made better and better at every step." The correlation of thought with all the modes of expression is a great pedagogical truth. We scarcely "touched the hem of the garment," but the healing came.

Every teacher holding an ideal inexhaustible in suggestion of better things became a discoverer. The best that went into the school almost invariably came from a teacher who had studied the needs of pupils and sought to supply them. In 1884 Prof. H. H. Straight introduced an idea that led to much thought and practice. He was of the opinion that arithmetic should be used in all studies, and, in the use, be mastered. The reasons for this may be stated as follows:

1. The one function of arithmetic is measuring quantities.

2. In real life—in home, industry, commerce—nothing can be done well without the use of number or measuring. Number is an indispensable factor in all work; in fact, without number progress would be impossible. In school no subject can be readily understood without the continuous use of number. Physics, chemistry, geography, and even history are full of questions in number. In every lesson there are problems that involve the exact limitations of quantity. All constructive activities must include number, for accuracy, exactness, proportion, and symmetry demand measuring.

The problem may be stated in this way: Which is better (1) to learn number as a subject by itself in order to prepare for its practical application, or (2) to learn number by and in its application?

The handling of objects in teaching is now considered necessary. So blocks, sticks, and all kinds of counters are used in the best schools. The use, however, of these counters and quantities is of no worth to the pupils beyond the mere measuring. The pupils do not, through the use of magnitudes, see or feel any intrinsic merit in the exercise. But the moment they measure for some higher aim, their interest is immensely increased, and the facts of number become a part of themselves. It needs little explanation to prove that, when a human being outside of school is working toward some definite end, he uses all the means within his reach. Why not give our children the same opportunity?

We took a good step toward correlating arithmetic with all other subjects, but only a step; very much remains yet to be done to prove or disprove the theory. Habits of teaching under the "knowledge aim" have powerful binding force. "So much in so much time" means, "I must exclude all except the definite facts to be learned." The character aim demands that everything shall be brought in which will concentrate and expand ideas and develop right habits. Personally I am entirely convinced of the truth of the theory.

The more we studied concentration the more important the doctrine became to us. Vistas to be explored, new details, fresh correlations, appeared on all sides. We felt that we had entered upon a work infinite in possibilities. The most important gain is in the immense economy of personal energy. This may be understood by the aid of the following statements:

1. The art of reading is mastered by using written and printed words from first to last as direct means of educative thinking.

2. Arithmetic is learned by the measurements actually needed in the study of subjects, as, for example, in manual training.

3. Skill in all modes of expression is developed by continual practical exercise in the immediate manifestation of thought. This applies to speech, oral reading, writing, manual training, and music; for—

4. The correlation of the modes of expression by which skill in one mode is obtained enhances the educative value of skill in all the other modes.

5. All the substantial subjects have an intrinsic correlation. History makes an imperative demand for geography. Geography is useless without history. Geology is the history of geography. Mineralogy is the study of the changes through which the material passes, and which result is geography. Biology is the study of life made possible by inorganic matter. Sociology is the study of the environment and home of man. The child begins the study of all these subjects before he enters school. Under the principle of correlation this study is continued. In mind growth all the energies of the pupil are engaged upon the direct study of the substantial subjects. In laboratories, in field excursions, in books, museums, and industries, everywhere, reading enters as a reenforcement of thought power, as a means of concentrating and expanding images. Arithmetic is an integral factor in all investigations, experiments, and study. The modes of expression are constantly used for their reactive influence upon consciousness, in relating and

strengthening images. In moral growth, under the ideal of community life, self-expression is made ethical action.

All this was by no means accomplished in practice, but enough was done to show plainly what may be done in the future by better teaching.

#### LANGUAGE.

The pedagogics of language are by no means settled. As a faculty, we grappled with the various problems that language teaching involves. It is needless to describe technical grammar, or the thin dilution of grammar called language teaching. What language pedagogics was and is, and its results, everyone who has been a pupil in our schools well knows.

What the blood is to the body language is to social life. Language, both oral and written, should be correct, strong, terse, clear, and graceful. It should be a great power in the one who uses it and of great influence for good to those who hear or read it. How may speech and writing be developed in the best possible way?

The study of the substantial subjects, man and nature, demands at every step a fullness of both speech and writing. The recitation is a means by which teacher and pupil help each other to think earnestly, honestly, and persistently. Each pupil is called upon, from first to last, to use his best efforts in speech. His language must be his own, and must be spontaneous; that is, must spring immediately from educative thought.

How may language be developed along the line of least resistance? Is it by studying technical grammar, by writing and speaking countless correct but unrelated sentences, or by taking it warm from the child's soul and correcting it, shaping it into what it should be? Is it not possible, under good teaching, to make language the warp of all exercises, both oral and written? If pupils repeat verbatim what they have learned; if there is no investigation, experiment, original research; if the controlling motive is not to help others, then the plan of developing language under the impulse of intrinsic thought must fall to the ground.

Our faculty tried the plan suggested. Both speech and written language were used as we used making, modeling, painting, and drawing. Whenever a suggestion, definition, rule, or any detail of technical grammar was needed to enhance the force and beauty of the expressed thought, it was given. Perhaps I am saying this too positively. It is exceedingly difficult to carry the rule just named into continual execution. I am sure, however, that the growth and development of language with our pupils was far better than under the technical grammar plan. We as teachers have been the victims of a very imperfect plan of language teaching, as a consequence of which our own knowledge of the laws of language is not equal to the new and higher demands.

#### CHILD STUDY.

The teacher has to do with the child and his destiny. This destiny is civilization and all that this word implies. The march of civilization means better homes, better society, better institutions, and a higher spiritual life. The child is God's contribution to civilization.

Self-realization consists in improving the condition of mankind through personal effort. True education brings the child into direct contact with the problems of civilization, adapting them gradually to growing power. The teacher presents the conditions, creates the environment best adapted to self-realization. Knowledge of the child's nature, of the laws of his growth, of the necessities of his best living, of the actions that should be aroused and sustained, and of those that should be inhibited, is absolutely necessary to the creation of the pedagogical

environment. The more the teacher knows of children in general and of a child in particular the better he can move his pupils in and toward an ideal. Froebel, Comenius, and Pestalozzi were students of children; hence their epoch-making reforms. All real reforms of education in the past have sprung from child study, and future educational progress will spring from the same source.

Within the past few years there has come to us through laboratory investigations and experiments in physiological psychology a more or less scientific child study. Our faculty was ready to receive the help so freely and so abundantly offered, for this help was in a line with our studies and discussions.

The practice school received quite a number, proportionately, of defectives and dull or backward children. In the absence of all unhealthful competition or rivalry the teachers were able by means of manual and physical training, nature study, a large variety of work and play, and close individual attention, to make the school of great assistance to them. The teachers were glad to have these unfortunates in their class rooms. It is well known that many good suggestions for the improvement of teaching have come from attempts to help defectives. Two deaf mutes, now successful in professional life, graduated from our practice school.

Child study brought us the truth which we had long suspected, that all really dull and backward children are so from some defect of body or brain; in a word, from some physical abnormality. Dull children through the ages have been scolded, flogged, nagged, driven to despair by both parents and teachers. Dullness was attributed to inner depravity. This one revelation of child study is enough to make it forever glorious. Instead of flogging there comes a sweet, strong sympathy for the victims of inherited or acquired weakness. The school, we found, can do a great deal for most cases. The right work and play, physical exercise, beautiful music, with great patience, will do much. Our record with defectives, if written, would be very instructive.

The discovery of "nascent periods" is of untold value to teachers. The term simply defined means that the kind and direction of a child's activities, mental and physical, are determined stage by stage by the growth and development of the body and the brain. Creeping, walking, talking are activities aroused and sustained by the different stages of physical development. The inferences are of exceeding value in teaching. The time for the teaching of reading, writing, arithmetic, etc., is determined by the physical and mental power which the child is able to bring to bear upon these activities. If the child is forced, the result is weakness. If the time is put off too long, there is a loss of power.

By understanding more clearly the interdependence of body and mind we were led to the conclusion that physical training should have a very prominent place in school; that play is the very best of physical training, and more, that play is the very best preparation for study. Under the splendid leadership of Carl J. Kroh it was proved that the child most skillful in physical exercise is strongest in all other school work.

Child study brought us much that was rich with suggestion and prescription, but, best of all, it made us more sympathetic, more patient and thoughtful with all our pupils. We studied and watched them and discriminated between real growth and delusive appearances of growth. A great flood of genuine humanity has come into the lives of our children, much of it through child study and through the heart of its great advocate, Dr. G. Stanley Hall.

In 1883 the school was meagerly furnished with apparatus, books, collections, and other illustrative material. There were a few specimens of birds, a fair collection of minerals, and some apparatus for teaching physics. The Eberhartonian Society had collected about 250 books. It is gratifying to report that the school now has an excellent all-around equipment: Thirteen thousand carefully selected

volumes in the library, card catalogued and arranged for use; the largest school collection of pictures in the world, and a very large cyclopedia of newspaper clippings. The picture collection and the newspaper cyclopedia are the work of Mrs. Frances Stuart Parker. Many of the collections, mineralogical and anthropological, also were made by Mrs. Parker.

No other bit of equipment ever came into the school from which so much substantial benefit was derived as from the printing press. The printing began in a small way. There was great need of reading lessons which would directly enhance the value of thought acquired by investigations, experiments, field excursions, and other study. The lessons in the text-book did not enter the child's apperception. After the use for a while of a mimeograph, a hectograph, and other duplicating devices at last a small printing press was purchased, with a font or two of type. Out of this has grown a very fairly equipped printing establishment. The printing of reading lessons was a great success, and the use of the type by no means ended with the new and fresh reading matter.

Under the knowledge ideal it is comparatively easy to make a course of study an orderly and logical arrangement of subjects, assumed to be a necessary form in an ordinary curriculum. Under the ideal described above the making of a course of study is an evolution, a constant and careful revision, made possible and necessary by the insight of the teacher and by a consensus of opinion on the part of the faculty. Details must be continually changed or eliminated and new elements and factors introduced. The printing office has been of very great assistance in the evolution of courses of study.

In 1895 the Cook County Normal School published the first course of study on the basis of correlation and under the ideal of community life. This course of study was to us a basis, or, rather, a starting point. Each department once in three weeks made outlines for the practice-school training class. These outlines contained subject-matter, with suggestions about illustrative material for adaptation, for methods, and devices, and a complete list of references for study. The critic teachers prepared outlines for one month's work, using the outlines of the special teachers as a general basis for class adaptation. These outlines contained criticisms, suggestions, directions, and references. This valuable printed matter kept the whole faculty informed as to the work of each of its members, throwing it open to criticism and discussion. It was also the best kind of periodical text-book for the training classes, giving them full directions for study, research, and investigation in preparing their practice work. Besides this, the syllabi for the faculty meetings were presented and given to the training classes, this tending to unite both students and teachers in one purpose—the study of education.

Two improvements of very great value were made last spring by the board of education. One was the establishment of a kindergarten department, by which Froebel's methods may better permeate the whole school. The second innovation eclipses all others. It is the introduction of a two-year course in place of the one-year course. This means that in the future the city and the county will receive from the school better teachers than they ever had before. One year is altogether too short a time in which to train young men and women in the art of all arts. The board of education in making this change took a great step in advance.

The plan of admitting students is by no means satisfactory. Ninety per cent—the average high-school standing required for admission—means very little, and an examination much less. Neither method insures such students as should be trained for the high office of teacher. The principal and the faculty of a high school, after four years' observation of their students, ought to be able to decide who would make good teachers after two years of normal training.

In closing this report I wish to thank the many friends who have stood by the school in its struggles for progress. The list of strong friends and earnest

defenders is a long and precious one, consisting of superintendents and members of school boards, both county and city, and of parents and citizens. I may be pardoned if I mention one whose name may be placed at the head of the list—Dr. Alfred H. Champlin, of Englewood. Above all, I desire to express my heartfelt appreciation of the earnest, self-sacrificing band of teachers who believed in the ideal of ideals and to it devoted the best in their lives.

No other step in my life has given me greater pain than to leave the school I love, to which I have devoted myself heart and soul for sixteen years. Nothing but a profound belief that I can do greater good elsewhere induced me to break the bonds that bind me to the children I love and to the graduates who, I sincerely pray, will bravely fight the battles for God's little ones.

What has been gained? Very much. One step has been taken in changing from the old, mediæval ideals—the ideals of monarchs and aristocrats—to the ideal of self-government, citizenship, a higher community life. Not with the guns of Dewey and Sampson, not with armies and navies will the inner, the decisive battles of freedom be fought. Our city, our country depends for its future on the teacher and the school, the school that insures the future by training the future citizen.

---

ADDRESSES DELIVERED AT THE SERVICES HELD IN MEMORY OF  
COLONEL PARKER AT THE UNIVERSITY OF CHICAGO, MARCH  
6, 1902.<sup>a</sup>

BY PRESIDENT WILLIAM R. HARPER.

Many lives contain tragedies greater and sadder than the tragedy which marks the end; but in the life that has just closed, so far as I know it, the greatest tragedy has been that in which it ended.

The life of our friend was never a smooth one, as lives go. With his temperament it could not have been expected to be smooth; but, on the other hand, it was not an unhappy life, nor was it one devoid of meaning to himself and to his friends. Few men, probably, have found greater satisfaction in life; for it was his determined purpose to make of it as much as possible—a purpose the execution of which assisted many and injured none.

The Colonel's life was a varied one. As soldier, student, teacher, as leader, administrator, and thinker, he filled at various times positions of high responsibility. There was a certain brusqueness in his voice and manner which some, perhaps, did not understand and with which they were not in sympathy; but even those who were in the outer circle of his acquaintanceship knew that this was only an external physical expression which did not represent his heart.

To me he seems to have been rather a prophet than a philosopher. The courage and the strength which he expended in fighting for the highest ideals of educational work, against opposition and in the midst of difficulties, marked the prophetic character. His singleness of purpose and his devotion to the cause he held so dear were most striking; but to those who knew him they were only natural. His mind was alert and always vigorous, widely interested and full of vision. His greatest strength lay in the wonderful power given him to sympathize with others; to enter into and to appreciate the experiences of others.

His love for children was extraordinary, and this single factor controlled his thinking and his life. Nor was it love for children in the abstract. The satisfaction with which he studied the growth and development of a particular child, the interest manifested in each individual, were the truest expression of the joy and

---

<sup>a</sup>These addresses are reprinted from *The Elementary School Teacher and Course of Study* (University of Chicago Press), June, 1902.

gladness which seemed to fill his soul in its close communion with child life. These, at all events, were some of the strong peculiarities of this, our friend, who has been taken from us.

I can see him now as he sits, with his hands crossed, listening with supreme delight to the expressions of child thought, one following the other, each illustrating some phase of the child nature. I can hear him now, speaking strongly and enthusiastically of the possibilities of child work; of the greatness and the nobility of the profession of child culture. And I remember how, during the last months, his whole soul seemed to be centered on the thought and the conception of the buildings for the School of Education; how he waited, so long and so patiently, always ready to sacrifice the present for the sake of a higher ideal to be realized in the future.

He was a man of superb idealism, unmindful of the present, provided that there seemed to be promise of a greater future; never moved by motives of expediency, but holding out before himself, as well as those associated with him, a high and splendid ideal toward the realization of which he made the most earnest effort; and in this is found the tragedy of the situation.

It was the realization of his most extravagant hopes when a broad-minded woman came to his assistance and placed within his reach the means with which to carry out his long-cherished plans. How unexpected; how generous; what possibilities it furnished! And then came the union with the university, which, to him, signified broader lines and still greater possibilities. The building plans revised and enlarged; his interest in it all and his devotion to it all through these months; the tender and sympathetic regard of the old trustees, every care being taken to secure for him and his work the most favorable environment, and, at the same time, his peculiar and deep appreciation of the favor and courtesy thus extended to him. And now he is gone, while the work is hardly begun. Three more years, and he could have died in peace, with all his efforts rewarded, his ideas formulated, himself seeing the walls of the magnificent group of buildings which are to be the outgrowth of his thinking and his work. Could anything be more sad? And yet he turned the soil for these buildings last June, and he spoke the first words uttered upon the grounds of the great school which through all the years will bear the stamp of his influence. Could we have known that day what was to be, how even more solemn and significant the occasion would have seemed!

---

BY ALBERT G. LANE.

*District Superintendent, Public Schools, Chicago.*

Colonel Parker came to the Cook County Normal School at a time when there was a rapid growth in this city and county and when about 300 teachers were needed annually to supply the increased demand and to take the places of those who retired from the service. This demand brought many experienced teachers here who availed themselves of the privilege of attending the normal school and of acquiring a knowledge of the principles and practices of the "new education" as enunciated by Colonel Parker. The high-school graduates who desired to teach in the county were required to take one year of professional training before they could become teachers. From the beginning of his work in this county he strongly molded and influenced the ideas, the motives, plans, and methods of all who came under his instruction. Nearly every graduate of his school commenced teaching with high ideals of the teacher's mission and a quickened power to arouse in children a keen, natural interest in any work which was undertaken. His graduates became observers and students of child nature. They sought to

lead the unfolding powers of childhood into channels of activity that would make them observant of things, their relations, and uses. They gave new life to the child's efforts by opening up various forms of constructive work, by making drawing a delight to children as a language for expressing thought. They made the study of geography full of intense interest by the lessons in science, by visiting and observing the surrounding country, by examining and studying the products of the soil, their growth, and the changes necessary to convert them to man's use.

His graduates learned to make reading a great means of growth and culture, relating it to some subject or object which was of attractive interest, something which the child was anxious to know. Many books furnishing information were brought into the schoolroom, and the children learned to use them. History, no longer memorized by the page, was made a delight to children as they read stories of the children of other lands, their dress, customs, and homes; of men's travels and achievements; of their struggles to build a nation where each citizen should have a chance to develop all that was highest and best in him.

Colonel Parker impressed his graduates with the value of each life as a factor in building up and maintaining the social well-being of any community. The central thought of all his teaching was mutual responsibility and freedom of the individual to come to a knowledge of truth. Truth frees from bondage. His graduates were trained to ally themselves to all public movements for the common good in the places where they taught. The people were brought to feel that they had a part in the life of the school. Old and young were frequently brought together and made conscious of the necessity of unity in all true growth and advancement.

I will not attempt to enumerate all the changes that have grown into our educational work as the result of Colonel Parker's labors during the last seventeen years. During that time about twelve hundred teachers have been graduated, and many others have taken partial courses, have studied his principles of education, and adapted many of his methods. The schools of Chicago and Cook County bear the evidences of more rational developing and inspiring work with the children. Their lives have been made brighter by the transforming influences of wiser, better teaching.

Colonel Parker's work and influence have not been confined to this vicinity. In those great annual institutes which were held, averaging for several years from 500 to 600 teachers, he found opportunities to set forth higher standards of education. His writings on education have been read and studied and their suggestions put into practice. Text-books for children have been modified to meet his thought, and that of others who have stood with him or have followed his educational theories and practice. There is scarcely a State in this Union where he has not lectured and aroused people to consider more carefully and intelligently the marvelous possibilities in the training of children.

During these years he has changed in many respects his methods of work, although holding firmly to fundamental principles. His conception of education is expressed in these words, spoken by him last summer at the meeting of the National Educational Association at Detroit:

We are marching along the endless pathway of unrealized possibilities of human growth. We believe that all that education has yet done, with its principles and methods, its reformers and its organization, is but a crude step toward that which must be. We believe that the inner development of the human soul in righteousness is the one purpose of education. \* \* \*

BY DR. JOHN DEWEY.<sup>a</sup>

This is neither the time nor the place to attempt a review of the educational philosophy or the educational work of Colonel Parker. But our noble and single-minded friend obeyed above most men the scriptural injunction; he loved and did with his whole mind and his whole soul. Hence it is as impossible to speak of his personality apart from his educational work as it is to speak of his educational work apart from his personality. He was fortunate in the complete identification of his whole being, his whole personality, with the work to which he devoted himself.

Thus there are three things in his educational work which come to me because they are characteristic of his personality, because they belong to the man. Colonel Parker was upon the programme of the educational meeting which was held in the city last week, but was kept away by his sickness. The title of his speech was "Education into citizenship." If there could have been anything more characteristic than this of Colonel Parker's attitude toward education, it was the subtitle, "Relating especially to dependent and defective and backward children." His last address sums up the man, his recognition of the social element in education, of that which makes it a real force in community life, and the outgoing of his heart to all those who, being helpless, needed peculiarly tender care. Much as he did for education in the way of improving and reforming its methods of teaching and its administration, the essence of what he did was greater than any specific contribution; it was to inspire the teacher and the child in the schoolroom with his own affectionate and sympathetic personality. He renewed the old lesson as to the shortcomings of all instruction until it adds devotion and love to intellectuality: "The greatest of these is love." He was accustomed to say that the social spirit of the schoolroom does more for the child than the formal instruction given; that what the children learn from contact with one another and the teacher is more than what they learn from the text-book and the lecture. If this be true, then the atmosphere and spirit of the schoolroom must be that of freedom, of confidence, of mutual interest in a common life of work and play. He was accustomed to say that all the resources of the schoolroom should be centered upon the "bad" child—resources of helpfulness and sympathy. That was most needed in the schoolroom. That which to the pedant and formalist is a barrier was to him an appeal. What he did in breaking down the despotism, formalism, and the rigidity of the old-fashioned school he did, not just because of abstract theory, but because he insisted that the love and faith, which are the tokens of the highest character everywhere, find a peculiarly appropriate place in the contact of the learned and the mature with the little and the feeble.

The second thing that comes to me in the connection of his personality with his educational work is that he believed there is absolutely nothing too good for the children. Many of you, doubtless, have heard him give a talk entitled "Nature and the child," in which he gave a poetic and idealized sketch (which I supposed to be autobiographical, although he did not say so) of a boy on a farm and his contact with nature. On that farm he studied, without being aware of it, mineralogy, geography, geology, botany, and zoology, and came in contact with nature in all her forms. He believed that what he did there himself in that undirected and casual way every child should be allowed to do, should be encouraged to do, through an educational system. Thus he did much for what is termed the enrichment of the elementary-school curriculum; not, again, just as an intellectual matter of putting in this and that study, but because he believed that whatever there is of value in the history of man and in the world of nature is the true birthright of every child born among us. To do anything by any method, by any system of

---

<sup>a</sup>From stenographic report.

administration which keeps the child from full and complete contact with these things, is a wrong against human nature and against the human spirit.

The third point in which his educational faith and his personality came together was his faith in the professional training of teachers, and in the science of education. I once heard him say that it was this thing that induced him to come out here. He gave up a position which, judged by a conventional standard, was one of superior dignity and importance. But in the position which he occupied he felt that he was getting away from the children. The more he had to do with such a position, the more also he realized that the future of education depends upon the training of the teacher. His belief in the unrealized possibilities of the art of teaching was sublime. It is an inspiration to all teachers everywhere—just as it has been to those who have come immediately under his personality. Just as he believed that there was nothing in the world of nature or art too good for the child, so he believed that there was nothing in the personality of another, no element of the human spirit, which should not be called forth in the art of educating, of developing the latent possibilities of the human soul. It was that moral goal, that moral ideal, the possibility of a fuller development, which inspired him in the work he did with teachers.

The great lesson that comes home to me from Colonel Parker's life, the great lesson that I feel that I ought to call especially to the attention of the younger people here present, is what it means really to attain success in life. Colonel Parker never temporized, he never used little expediences or policies. He never got lost in the smaller things of life; he kept his eyes steadily on the great things, and he fought onward with all the vigor of his personality for those things which are enduring, invisible, and worth while. He waged warfare against opposition; the opposition that came from those who could not get beyond the things they could see and touch, and who consequently had attached themselves to the mechanical and formal. The opposition was sometimes active and virulent; more often that of indifference and inertia—harder to face than the active sort. But he never wavered a moment; he never compromised; he never sacrificed the spirit to the letter. As a result, more than the usual measure of success came to him.

Twenty-five years ago, in Quincy, Mass., the work he undertook was an object of derision, as well as of sympathy, all over the country. He was a pioneer, and to many he seemed a faddist, a fanatic. It was only twenty-five years ago, and yet the things for which he then stood are taken to-day almost as a matter of course, without debate, in all the best schools of this country. Afterwards, in Chicago, he waged, against untoward influences, the battle of the professional training of teachers; he fought to keep away every political and personal influence that might in any way lower the standard of the school. Every year he had to wage the battle over again, and every year he simply made his appeal to the people, to the democracy, in which was his trust. His faith in human nature was rewarded. Every year forces rallied about him, and, working with him, won his battles against the combined ranks of political and personal enemies. He gave years of struggle to the elevation of the education of the child and of the teacher; and in his last years, with full poetic justice, with more than the recognition that comes to most pioneers and apostles in this world, his beneficent friend crowned his work with that generous gift which brought within sight—alas, not within grasp—a realization of his lifelong dreams. These things came to him not because he sought them, but because he sought the things which he considered permanently worthy and desirable. And with these other successes came to him the love and loyalty of devoted and attached friends. He was fortunate above most in winning to himself the loyal assistance and unflinching confidence of others.

When a great life has passed away, we get a better perspective of the things that are really worth while; the smaller things, the temporary things, drop back where they belong, and the qualities that ennoble life—faith, courage, devotion to ideals, an end to fight for and to live for—stand out in their supreme significance. Our friend's physical presence has left us, but his spirit remains, reenforced and multiplied. It abides not only in this university community and in this city community, but it lives on in the heart and in the work of every teacher throughout this broad land who has been touched by a truer perception of the high ideal and calling of the teacher.

---

BY EMIL G. HIRSCH.<sup>a</sup>

\* \* \* We who have crossed the noon line of our life remember well that routine, mechanical reciting, deadening, soulless, devitalized memorizing, ruled in unquestioned regal state in the schoolroom when we were young. A mighty change has been wrought since we were forced to submit to this paralyzing torture of the primer and speller. Then the teacher was regarded as a machine, so constructed as to measure off, in accurately determined quantities, intellectual electuaries which the pupil was to swallow. Education, so called, consisted in transmitting, in well-regulated flow, from a large barrel containing information, to the memory of the child, the daily doses. And the pupil's part in this process was restricted to parroting, with prescribed sing-song, the text-book. History was a jungle of unconnected and bewildering dates and names. Stress was laid on ability to rattle off, at a given signal, forward or backward, as whim pleased, the catalogue of battles or of Presidents. He who could mumble off the names without tripping, and at the highest speed, was crowned with distinction. Arithmetic was a series of tricks, never the application of general and well-comprehended principles to concrete instances. Imitation, not initiative, was the keyword to the educational creed. The eye and the ear were not called into play for the purpose of mastering the inconsistencies and intricacies of English orthography. That the historical development of our language had no place in the scheme goes without saying. But even the natural instruments at the disposal of every child were neglected. Spelling was a drudgery—another tax on the memory. Words jumbled together, for no other reason than that they were of the same number of syllables, were pumped into the mind of the hapless victim of the system. Interest was rigidly banished. Rough and ready utility was invoked to fig leaf the nudity. To-day air, sunshine, life, flood the schoolroom. Pupil and teacher alike have been freed from the house of bondage. Whose is the credit? It is his whose mortal remains will soon be consigned, by loving hands, to the grave. It was not an easy task to arouse men and women to a better understanding of the implications of education. The old way, just because it was rigidly mechanical, was the easiest way. It ran along the line of the least resistance. The daily programme could without much thought and trouble be arranged. The standards of promotion from one grade to another could without difficulty be fixed. Teachers could be held inflexibly to finishing a certain amount of work. They could be rated successful or the reverse without much labor. Why, then, should this convenient scheme be replaced by another? Colonel Parker put the trumpet to his mouth and declared to American educational idol worshippers their transgression. Prophet he, he sounded the alarm in no uncertain notes. Bel and Dagon toppled over. The walls of Jericho crumbled before his blast. Routine had to give room to reason. Reception and transmission of knowledge

---

<sup>a</sup> Revised from stenographic report.

were relegated to the rear. In their stead America learned to put emphasis on thought, on observation, on objects. Books were made subsidiary. The manual was almost branded an intolerable intruder. The appeal of the teacher went out to the creative energy of the pupil's soul. Learning was discovered to be, in very truth, construction and combination, not repetition and imitation.

And another Moloch to which children had been offered was destroyed. The old routine had invited the spirit of rivalry to an important function. Competition was encouraged and stimulated. School work was twisted into an ending beyond. Prizes, marks, honors, were deemed incentives and ultimate objective points. Unholy passions were aroused and played upon. Envy, jealousy, opening the door to dishonesty and favoritism, followed in the wake of the competitive zeal. Another Ruskin, our departed friend saw the pernicious influence of the plan. He understood the injustice inseparably connected with its much-lauded philosophy. That it resulted in injustice to the honest pupils he could not conceal from himself. Who won the distinctions? Not the conscientious boy, but he that nature had most lavishly gifted. Medals and the best marks fell to him who, richly remembered at birth, could without pain absorb what fragment of knowledge constituted the test, and easily rattle off or write down the answer to the decisive question. But the painstaking boy of nervous organization, the timid lad, or he of less quick reaction, who had to work hard to master the problem, or, rather, to remember the trick shown to lead to the solution, because of slower temper and of more limited capacity, was not rewarded. Effort counted for nothing. Results only were considered. Colonel Parker could not compromise with such fundamental immorality. Cooperation, not competition; altruism, not selfishness, he held to be the sacramental terms of consecrated pedagogy. Justice he would have reign wherever teachers and pupils met. What to him that the world also follows the haphazard plan of distributing its prizes not in accordance with merit but with results? The school for him had all the more urgently the duty to construe its work on ideal lines. Merit, not result; effort, not attainment, was his polestar.

Again, because he had so high a conception of the function of education, he was among the first to preach in this country a gospel long before heard and accepted in other lands. He insisted that teaching was noble enough, was exhausting and encompassing enough, to be a profession, meant to fill out the life of him who would embrace it. It is not so long ago that teaching was regarded as a sort of stepping-stone to something ulterior and more profitable. The school-room was looked upon as a convenient wayside station where one might get off and while away one's time, "hearing lessons," before an express train came along to rush one on to the ultimate destination. Teachers were almost Micawbers, "waiting for something to turn up." In consequence, everybody that was equipped with a moderate amount of information, disjointed and inaccurate though it was, was thought fit to be a teacher. To teaching turned those that had not yet made up their mind what to become, those that had no mind to decide in what field their vocation lay, as well as the thousand and one that had suffered shipwreck on the ocean of life, the sad "misfits" that had been found incompetent in other pursuits. That the teacher's dignity suffered as much as did the school under this hallucination is plain. Acknowledgment of the social service the teacher renders, and adequate compensation therefor, was not meted out to the small, noble fraternity of true and devoted pedagogues that even at that time here and there had made their work tell under these most trying circumstances. But the teacher's profession finally won recognition, and then largely through the persistent efforts of Francis W. Parker. His normal school sounded the death-knell to the ridiculous pretension that everybody that chose to be could be a teacher. It emphasized the truth that knowledge is the least part of the

teacher's qualifications. Teaching is both a science and an art. Few are they who can wear the miter of its priesthood. And they that minister in the temple of elementary or other education must pass many years in self-searching preparation before they can be admitted to the diaconate and the higher orders. \* \* \*

---

LETTERS AND TELEGRAMS FROM FRIENDS.

Colonel Parker was an educational hero, devoted to the improvement of methods in the elementary school. He showed great fertility of resources in discovering devices to secure self-activity in the pupils. His amiability, his devotion to the cause, and his contagious enthusiasm made him a myriad of personal friends, and many myriads of disciples who will mourn his death. His good work will live on and bless the generations yet to come.

W. T. HARRIS,  
*United States Commissioner of Education.*

---

Colonel Parker made a distinct impression upon American education, because he first presented to the intelligence of the country the unwisdom of mechanical methods in instruction. It is quite possible that his philosophy was not new, but he was the first American teacher who had the force of character to put it in operation in a prominent New England town, and he possessed the accomplishments as a writer and speaker to command for it the attention of the country. He saw, long before the great body of American teachers, that children are not to be taught like dogs and parrots, by memorization, but by gaining their interest and starting their powers into activity. He was derided, but he commanded a hearing; he was opposed, but opposition made him more aggressive. He was extreme and intolerant, and the country never accepted his doctrines in their completeness, but in very large measure his contentions have come to be universally adopted. It could hardly have been so but for his aggressiveness and intolerance. He broke out new roads and it could only be done by harsh and heavy implementations. He was a ready writer and an accomplished, even unique, public speaker. He was an inspiration, and a very welcome one, in all educational gatherings. Withal, his was a genial spirit, a sympathetic nature. He made friends, even disciples, of his students, and the elements in his unusual character drew unto him all who came within his reach. His death is a loss to American education, but he has a place in our educational history and it is secure. Half a million American teachers will be pained at the news of his death and would like the sad privilege of laying a flower upon his bier.

A. S. DRAPER,  
*President University of Illinois.*

---

My life in Chicago is a little longer than was Colonel Parker's. I have watched him through all the strain and stress of his tireless career, and in it all I detected that enthusiasm for liberty, that love of childhood, that devotion to progress, which made him so persuasive an influence, his presence perhaps more felt at a distance than near at hand. He was a pioneer who took the knocks that make it the easier for those who follow. If only they would appreciate this and press forward with the banner that has fallen from the hands of their leader, it is well. A brave heart has ceased to beat; may the hearts of his friends beat the more heroically!

JENKIN LLOYD JONES.

In Colonel Parker I lose a valued friend and the young people of the United States one who gave his life to their service; but while we mourn the wise and gentle man gone, we rejoice that he has so impressed his spirit and ideas on his pupils that his work will be carried on and his influence spread in ever-widening circles as time goes on.

ALEXANDER GRAHAM BELL.

---

It is difficult to write with moderation about Colonel Parker now. There has not been time to recover from the shock of sudden separation. Strong personal attachment is not perhaps the most favorable condition for discriminating judgment. To me he was the most original and interesting personality prominently identified with popular education since the time of Pestalozzi. While he was far more happily conditioned than the Swiss reformer, he was at the same time immeasurably his superior as a teacher and leader. He was completely liberated from the old knowledge ideal of Renaissance. What Montaigne had made the theme of his scholarly essays on education Colonel Parker had embodied in a school. He not only reiterated forever the maxim of Comenius, that we learn to do by doing, but he supplied to little children the conditions for the most rational and helpful doing. He did not content himself with joining Rousseau in withering condemnation of the verbalism and mechanism of the schools, but he made a school that was at the same time a beautiful home, where childhood was dignified by the ministry of the wisest and best teachers that money could employ. There is no teacher in all our common country that is not his debtor. He was always insisting with all of the vehemence of his tremendous power that education is the supreme concern of the state, and that teaching is incomparably the most important and the most elusively difficult of all the arts, and that within the narrow round of the school there is ample space for the exercise of the rarest gifts that lift the divinely selected souls above their fellows. He is the last of his race. He was vastly larger than his philosophy. Our grievous loss is this great personality, so unique, so magnetic, so personal that no doctrine can ever take its place.

Dr. JOHN W. COOK,

*President Northern Illinois State Normal School.*

---

I am shocked beyond expression at the news of the death of Colonel Parker, a friend of many years, and one whose strong, virile personality had won its way deep into the hearts of thousands of the men and women of America. The whole history of American education has never seen purer idealism or more sincere devotion than Colonel Parker's. He believed in democracy with all the fervor of his nature, and his love for the child and childhood knew no limits. As a great inspiring force who was impatient of artificial trammels and of formulas when life and spirit were at stake, he has had no equal in our public-school service. His heroism in the schoolroom will be vividly remembered long after his unselfish service to his country on the field of battle has faded into history. His death is to me a deep personal loss, and I sympathize profoundly with his friends and associates of many years who have labored with him for as lofty an ideal as has ever been conceived by the human mind, namely, the ideal of a free and educated democracy.

NICHOLAS MURRAY BUTLER,

*President Columbia University.*

I have known Colonel Parker and his work ever since he began at Quincy, Mass. The country loses in him one of the greatest educators we have ever had. Elementary education in this country owes more to him during the last twenty years than to any other man. He has been a magnificent ferment, stimulating activity everywhere, and breaking up monotony and routine, to which education as by an iron law always gravitates. Few have ever been more devoted lovers of children and of the teacher's work, or done more to infect both those within and those without the rank of the profession with this passion. His function has been not unlike that which Socrates ascribed to himself, that of a gadfly to stir up the magnificent but sluggish Athenian people. No man in the profession would be so widely and deeply mourned.

G. STANLEY HALL,  
*President Clark University.*

ADDRESSES DELIVERED AT THE MEMORIAL EXERCISES GIVEN BY  
THE PUBLIC-SCHOOL TEACHERS OF CHICAGO AND COOK COUNTY,  
AUDITORIUM, APRIL 19, 1902.

BY ORVILLE T. BRIGHT,

*Superintendent of Schools, Cook County, Ill.*

Francis Wayland Parker had no other ambition than not only to be called but to be a great teacher. His love for children was all-pervading and intense; his capacity for work in their interest knew no limits; his desire and determination that the public schools should furnish the very best opportunity for the all-around development of childhood, both in subject-matter and administration, were fixed and unswerving; the only rivalry he would tolerate was between what the individual child did and what he was capable of doing. When only ridicule was heaped upon the advocate of the kindergarten, of music, drawing, and manual training by the entire press, 90 per cent of the people, and three-fourths of the teachers, Colonel Parker saw clearly their tremendous educational importance, and was just as staunchly their defender as we are now, when to stand for them is only respectable. The elements of his character were so pronounced, his personality was so vivid, his faith in the future so certain, he was so intensely alive, and his great heart beat so warmly and so truly for his work, for his friends, and for all the children that it seems almost impossible that we shall see him no more.

In the few minutes at my disposal I wish to speak only of Colonel Parker's work in the Cook County Normal School, as I was officially connected with that work ten out of fifteen years.

When Colonel Parker accepted the responsibility of the Cook County Normal School and entered upon the great work of his life the situation was not only not ideal, but it would have daunted a less courageous man. To specify:

There was an ill-arranged and dilapidated school building, a dormitory in like condition; there was no library to speak of, no science laboratories, kindergarten, manual training, or gymnasium; very little apparatus of any kind; and a faculty with about an equal mixture of competence and politics. The press of Chicago was hostile, not only to the school but to the training of teachers in any way. The city teachers and principals were very conservative with their friendship or openly hostile, and the school was ignored by the Chicago board of education. The attitude of the Chicago schoolmen was much like that of the Boston masters to Quincy in the years then just gone. The only thing about it of which we had no doubt was that we didn't believe in it. The one thing of which we might

with reason have been certain was that we didn't know anything about it. The financial support of the school by the county was niggardly and precarious. The fact of the matter is, the conviction that young men and women should be trained for their work in order to teach little children existed only here and there. The general public was against it. Less than twenty years have exactly reversed this sentiment.

It may well be understood that the normal school presented excellent opportunity for limitless work, courage, inspiration, and vigorous administration. It got them all. Some people have questioned Colonel Parker's suavity in modo, but none have cast a reflection on his fortiter in re. The first year showed plainly that the faculty must be reorganized, and the doctrine that the president of a normal school should control the appointment or dismissal of the teachers was flatly presented to the board. The fight was brisk, but it was short and decisive; the question was never again raised, but dire threats followed the failure to prevent the first elimination of teachers, and, later on, five or six years of bitter struggle showed how sincere they were.

Present limits will not admit of any detail in regard to the next fifteen years' work. A vigorous policy, conceived in honesty, is sure to make enemies, but it is just as sure to make friends, and the friends of the Cook County Normal School were sturdy and true and fearless. Crises were frequent and acute. In 1890 the bitterest enemy of the school secured appointment on the county board of education, and immediately proceeded to a series of the most unfair and unreasonable examinations of the practice school. The results of these examinations were published and sent over the entire country, but the spirit that instigated them was so apparent that little harm was done. The avowed object was to "down Colonel Parker," but he wouldn't "down." From 1890 to 1898 the struggle was incessant, and annually for several years the result turned on one single vote, but we always got that vote. Moreover, the school received better financial support. The work of the school went nobly on, gaining each year, Colonel Parker never for a minute losing courage nor doubting the outcome. Students came from all parts of the country, and some from other countries, and for the last few years of the Cook County Normal School we had a hundred fine graduates each year. The practice school increased so that there was not room for the children. A choice library grew up, including 10,000 volumes, and a collection of more than 20,000 clippings and pictures, selected, mounted, and catalogued by Mrs. Parker. Effective gymnastic training was provided, excellent laboratories were established, together with valuable cabinets, both historical and natural. A fine kindergarten and manual-training department were added, and a printing establishment was set up. There was a general renovation of the buildings, new furniture was supplied, and the schoolrooms were beautified with pictures and casts. But, as part of the school, all of these were as nothing when compared to the corps of teachers Colonel Parker's tireless efforts had gotten together. A few of these teachers had been found ready-made, but most of them were trained in the school, and it is safe to say that no more earnest, efficient, and devoted body of teachers ever worked to carry out the purposes of an inspired leader.

January 1, 1896, the Cook County Normal School, thus thoroughly equipped, with its magnificent property and its splendid record, was transferred to the city of Chicago and became the Chicago Normal School. Not only the school property but the entire faculty was accepted by the city board of education. It was a memorable night for the city of Chicago. The school was adopted because the people of Chicago demanded it, and this demand was voiced by the Chicago press. The faculty, including Colonel Parker, was retained in charge of the school because the people of Chicago would not have it otherwise, and hundreds of them were in attendance at the meeting, so that there should be no mistake as to what

they wanted. The excitement was intense and the scene dramatic. The shuffling uncertainty of conservatism was on exhibition, as it always is. The man who had struggled so persistently to bring about the downfall of Colonel Parker was then a member of the city board, but he was obliged to submit to the inevitable; the people had their way, as the people always can have their way.

From the Chicago Normal School, under Colonel Parker, two classes of nearly 400 each were graduated, and these city students have shown the same loyalty to their leader as was formerly shown by the students of the county. In the spring of 1899, on the recommendation of Colonel Parker, the course of study was changed from one year to two years, and this was his last service to the city as principal of the school, his resignation following in June of the same year.

The influence of the Cook County Normal School on the schools of Chicago, of Illinois, and of the Northwest has been profound. Nothing could be wider of the mark than to speak of this school as a training school in methods or devices. The aim of instruction was set forth in a report of the principal in 1890. Pupils were entitled to diplomas on the fulfilment of certain conditions:

1. Attendance for the full time allotted.
2. Satisfactory evidence of a high appreciation of the duties, responsibilities, and possibilities of the teacher's profession.
3. Sufficient knowledge and skill to warrant the beginning of the work of teaching.
4. Ability to control, govern, and teach a school fairly well.
5. A knowledge of the principles of education, sufficient to guide the candidate to the discovering of right methods.
6. A love for children and devotion to the work of teaching.
7. Tact to adapt oneself to circumstances, and, at the same time, courage enough to cling to a growing ideal of the teacher's functions.
8. A close, earnest, persistent student of the science of education and of the subjects taught, and a habit of preparing very carefully every lesson and all other work.
9. Good health and an excellent character.

So far as academic education was concerned, a four years' high-school course was demanded for admission; but Colonel Parker's ideal of preparation is stated in these words:

A four years' course in a good college should supplement a high-school course before the student enters upon professional training. It is far preferable to have a college course without professional training than to have only a high-school course with training. The true requirement should be the college course *and* professional training.

Again he says:

There is no question that the fundamental cause of imperfect teaching is due to the ignorance of the subjects to be taught, or that the abuse of text-books is largely due to the same cause; it is also true that the mere study of methods can not be substituted for deficiency in knowledge of subjects taught.

Again:

If a pupil after years of study has not acquired a deep, abiding love for the subject studied, he has acquired very little. A strong desire to continue indefinitely the study of a subject is the result of proper teaching and is an unfailing indication of true knowledge of that subject. The first endeavor in the work of the professional training class, and the one too often omitted altogether, is to cultivate an all-controlling desire for study.

And again, so far as school government is concerned:

The one rule of order is: Do everything possible to help the work of the school and nothing to hinder it. The direct function of the teacher is to help others, and the main idea of the school is to develop this function among the children.

This is a high standard for the training of teachers, and it is the standard which controlled in the Cook County Normal School. It makes the inculcation of methods and devices seem petty and trivial. From the standpoint of teachers bound to a course of study, requiring a given amount in a given time, and where estimates of proficiency were gauged by per cents and final examinations it was hard to understand. Time and patience were required to make this standard prevail to any great degree among public-school teachers, but at the present time the schools are few indeed which have not felt its influence to a greater or less extent. Since Colonel Parker came to Chicago the whole spirit of teaching has changed. The study of children and their needs has been profound, and the work of the school has been determined from the standpoint of the child rather than from that of the adult. The new education has put teachers on the defensive as regards subject-matter to be taught and when to teach it, and as to the management of children. The defense of the teacher's work and the furnishing of adequate reasons therefor are sure to modify that work, if not radically change it. This service to the schools has been incalculable, and it would be a poor observer indeed who should not accord to Colonel Parker profound influence in bringing about this result. Sincerity, which was born of profound conviction, prevailed in all the work of his school, and this sincerity was developed in his pupils. As a superintendent of schools, I have been associated with hundreds of them, and they have been more zealous to learn, more susceptible to suggestion, more earnest inquirers after truth than any other teachers whom I have ever known. The prevailing sentiment among the graduates of the normal school was that their work in learning how to teach, instead of being finished, was only begun. The criticism has often been made that the quality most prominent in the graduates of normal schools is conceit, but I should say of Colonel Parker's students that this quality is most noticeable for its absence. The graduates of the Cook County Normal School have become leaders in education in many parts of the country, and they have preserved an unswerving allegiance to the man who was the inspiration that determined their educational ideals. The influence of these graduates has, of course, been most felt in Cook County and northern Illinois, where they have been most numerous.

Illinois has sometimes been called the storm center of educational thought and progress during the past five years. To whatever extent this is true it is due in no small degree to the high standard and the unswerving purpose which obtained as a part of their training.

The all-important correlation of studies, as it has to do with proper mental development and economy of school time and effort, received its greatest impulse in the carefully elaborated course of study which appeared in 1892. Few schools could carry it out in its entirety, but it has greatly modified a large proportion of the courses of study made since that time. Its influence is most notable in three ways: In the very general study of elementary science which has prevailed in primary and grammar schools of late years; in the enrichment of the elementary courses of study with the literature suitable to childhood, and in the recognition of the principle that an all-around development of the child demands the training of the hand as well as of the head. \* \* \*

---

BY BISHOP JOHN LANCASTER SPALDING.

The highest social functions are performed, not by conquerors or rulers or legislators, or the providers of the necessities, comforts, and luxuries of physical life, but by teachers, whether they be mothers, priests, poets, discoverers, inventors, or schoolmasters; and that which is indispensable and of paramount importance

in the teacher is not so much knowledge as character, since the great purpose and end of education is to form character, and this can be rightly done only by men and women in whom there is a hunger and thirst for human excellence. Others deal with the things that concern life; the teacher, with life itself, which it is his business to foster, develop, and produce in higher and higher potency.

Character is a persistent pursuit of what one believes in, admires, loves, and feels himself able to accomplish. If this is material, he is a matter-of-fact man, having the significance and worth of a machine; if it is spiritual, he lives in a world of thought and freedom, where all things are possible. One may be drawn to what is useful and pleasant, or he may be overmastered by a passion for what is true and right, and so be empowered to neglect or scorn what is merely useful and pleasant. He whose ideal is use and pleasure belongs to the unreasoning crowd; he for whom truth and justice and love are the only sufficient ends of life belongs to the few, whose faith and example become light and strength for the purest and the best. If his country be made a desert, if his people be overwhelmed and scattered, he shall abide; for what he believed in and lived by is eternal.

This is the spirit of all genuine teachers. They believe in the good of life and in the surpassing power of right education. Their one aim is to uplift, strengthen, and enlighten men; to enable them to know and love the vital truth, which gives the inner freedom that makes man the noblest and most blessed of God's creatures. That one should be poor, should be unrecognized, should have to toil that he may live, is not in their eyes a thing to be dreaded. For them the infinite evil is to be ignorant, is to be base, is to be the slave, not of a tyrant, but of instinct and passion, of lust and hate and greed. Poor men have been heroes acclaimed of all the world. Men who have walked and died in obscurity have risen to shine forever like fixed stars. The divinest being who has appeared in human form toiled that He might live; but the victims of ignorance, of greed, of hate and dishonesty, though they be kings, though a nation's wealth be heaped about them, are interesting only as a contrast to what constitutes the worth and dignity of man. They are but weeds that prove the soil's fertility. Though the people dream and think and talk of trade and commerce and wages; though they place but a money value on genius, virtue, and beauty; though they consider as naught what can not be weighed or counted, the God-appointed teacher, with ever-growing insight, sees that the real things whereby man's soul is nourished can neither be weighed nor counted. He is a lover of human perfection—intellectual, moral, and physical. He would give his life to make men wiser and more virtuous. He feels that all values are educational values—means whereby life is sustained, enlarged, and purified; that life itself is enrooted in God and draws from Him its substance, its energy, its beauty, and goodness.

No genuine teacher has ever been inspired or guided by mechanical ideals. His genius and power spring not from the arithmetical or logical faculty, but from his capacity for infinite faith, hope, and love, of which are born infinite patience and painstaking. It is his sympathy with all that is human that gives him the insight which imparts the skill to develop what in man is best. Above all is he attracted to little children whom God sends into His world to awaken sympathy, love, and devotion; whom He showers like blossoms in spring to teach us to hope and labor for ever diviner harvests. His spirit is rather that of a generous and dauntless youth than that of a calculating man. There is in him something of Plato and vastly more of Christ. He is an idealist and reveals the soul to itself. His pure eye reflects the azure heavens; the flowers spring from beneath his feet; he is free, tranquil, and joyous, at home in his Father's house, though he be beset by enemies and have not where to lay his head. No difficulties affright, no obstacles deter him. He is certain that the work he does is the noblest task which

can be set for man. He therefore does it with all his heart and finds sufficient reward in the doing.

Such a man and such a teacher was Colonel Parker. He was not a man of rich and varied learning, not an original thinker, not a logical reasoner, not a master of style; but he was one whose faith in the power and value of education was deep and living. Such a faith, springing as it does from genuine interest in human perfection, begets an abiding enthusiasm which leaps from soul to soul. He who is thus inspired is not indifferent to anything that concerns the welfare of his fellows. He stops not to argue; he hears not those who suggest doubts and misgivings; he asks not whether there be danger of failure. An inner impulse urges him on; he will do what he can, come what may. His presence breathes courage, confidence, and gladness. His pupils feel that they are able to do what he demands of them, and so they become able. His voice is like the shout of his captains when they lead to victory. His eye awakens and fixes attention; his whole manner stimulates and sustains the desire to improve. Where he is there is little question of rules, for he is himself a law for all, putting forth the highest educational force, which is the influence of a genuine personality on persons. When, a quarter of a century ago, Colonel Parker was put in charge of the schools of Quincy, they were quickly transformed, as the spring rain and the sunshine transform the naked earth. A new spirit breathed, and a new life sprang forth; and it was not long before teachers all over the country began to lift their eyes to this dawn which had broken with promise of a fairer day. Here was one who trusted in man's creative soul more than in mechanism and methods and routine and drudgery. Here was a bringer of hope and joy to the teachers who were wandering neglected and unilluminated mid arid wastes. They began to look to him as to the leader for whose coming they had yearned.

What he brought them was not a new and original theory of education and pedagogy. It was a new spirit which was to interfuse itself with their work, and little by little to transform the whole process of teaching. The schoolroom became more like a home where there is a loving association of all the members; where life is free and joyful; where work is pleasant, and invigorating; where the tiresome routine of text-book and recitation is relieved by drawing, modeling, and music; where the pupils are gently led on to express their own thoughts in their own words, and not passages learned by rote. Obedience, confidence, courtesy, and respect were made easy; individuality was developed; the duller pupils were encouraged and assisted, while self-consciousness and conceit were repressed in the brighter. The yoke of slavish conformity to rules was lifted from the neck of the teachers, who were accustomed to study the peculiarities of each child and to fit the means to the end, while they themselves were made to feel that the essential and decisive thing in a teacher is not learning, but ability to teach. In the examinations the test was skill, power to think and do, and not merely knowledge.

The teacher is the school, and it was to the forming of teachers that all Colonel Parker's efforts were directed. He believed that the most important social function is performed by the educator; and he held, consequently, that the best work one can do for society is to raise to highest efficiency the men and women whose vocation is to inspire, instruct, counsel, and guide their fellows, not in the things which concern their temporal affairs chiefly, but in whatever pertains to wisdom, conduct, and character. The good is all that ministers to spiritual life, to intellectual strength, to moral freedom, to righteousness; and they who follow the teacher's calling should feel that their task is God-given, that their work is divine. They should have courage, self-confidence, enthusiasm, zeal, devotion; and that this may be possible they must be trained in the atmosphere of liberty, wherein alone self-respect and self-reverence, the foundation of all virtue, can be learned.

They must be able to do their work with a cheerful and joyous spirit, for whoever does well and wisely acts in this spirit. That they may dwell in the pure air of high and tranquil thoughts, they should be protected from all annoyances and restraints other than those necessarily involved in the work they do. They can not succeed if they have not the willing mind to which nothing is hard, and everything, therefore, should be done to create and foster in them love for their work.

The brave and cheerful delight us, have power over us, and influence us for good, because their world-attitude is the result of a true view of things, which, in revealing to us that to be is better than not to be, creates within us the feeling that the more we are alive the more nearly we are akin to the eternal source of all that is.

To these help-bringing and joy-inspiring souls Colonel Parker belongs.

That he was a lover and mold of teachers it is not necessary here in Chicago, or in America indeed, to affirm. As the principal of the Cook County Normal School he sent forth, year after year, eager, enlightened, devoted men and women, whose work in the schools of Chicago has not been rightly recognized or appreciated by the people of the great city in which they have wrought with so much intelligence and zeal. He himself was not understood or esteemed at his real value except by the few who entered the narrow circle of his personal influence. How shall an idealist, an enthusiast for human perfection, have honor in a world given over to the worship of mammon and vulgar success? Yet how pleasant it is to see an American who is enthusiastic about anything that is not a mechanical invention, or a gold mine, or a phenomenal increase of population or territory, or the sudden emergence of a plutocrat! But money and machines never inspired a noble thought or a pure love or an unselfish devotion. They can not create the moral climate wherein the bringers of divine gifts live.

They tend to make men the victims of routine and detail; they beget a servile spirit by turning thought and desire to the pleasure and the power which wealth procures, away from the pleasure and power which are born of the exercise of the higher faculties, which spring from the activity of the soul, from the intellect, the conscience, and the imagination. They destroy faith and freedom, and fashion a public opinion which calls liberty license, and accustom the people to prefer material interests and ends to those which are ideal and absolute. So the great principles and heroic faith which enabled our fathers to establish this Government are forgotten and forsaken. There is no more certain symptom of such general decay than the loss of liberty in the schools. If the individuality of the teachers is repressed; if their sense of security is enfeebled; if it is made difficult or impossible for them to work with brave and cheerful hearts; if they are controlled and hampered by petty rules and regulations, nothing can save the school itself from ruin.

It was his firm grasp of this fundamental truth that made Colonel Parker an educational leader, a lover and teacher of teachers; and if we are to save our democratic institutions and civilization from destruction, we must more and more work in his spirit.

#### AN ESTIMATE OF COLONEL PARKER.<sup>a</sup>

By WILLIAM RAINEY HARPER,

*President of the University of Chicago.*

In the field of elementary education the most significant single event—that which has touched the largest number of persons and affected them most keenly—has been the death of Col. Francis W. Parker. As in the case of most men who

---

<sup>a</sup>From a report made to the National Council of Education, Minneapolis, July, 1902.

have accomplished much, the greatness of his work was not fully apparent until he was taken away. The universal appreciation of his leadership, the universal testimony to the greatness of his career, and the universal mourning over his sudden death, together constitute the most striking event of the year. That he should be taken away at the very moment when he was about to enjoy the fruition of a lifetime's work, and that he should not be permitted to enter the buildings on whose plans he had spent so much time and energy, was indeed pathetic; but that he had built foundations broad and strong for future work in the field of elementary education; that he had made noteworthy contributions to the cause of public school education; that, indeed, he was one of the great leaders of the last quarter of a century is everywhere acknowledged.

---

FRANCIS WAYLAND PARKER. *a*

By FRANK A. FITZPATRICK,

*Boston, Mass.*

To write of Colonel Parker's work in such a dispassionate way as to form a lasting estimate of the value of his services to the cause of education in the United States would require a perspective of years and also a mind free from bias toward or against Colonel Parker's personality. It is not easy, even taking into consideration Colonel Parker's great qualities and his weaknesses, to make a fair, comparative statement of his services from the standpoint of a friend.

Among the multitude of able, self-sacrificing men who have contributed notably to the improvement of elementary schools during the last fifty years, it will not be deemed invidious, I trust, to mention the names of Victor M. Rice, of New York; Horace Mann, of Massachusetts; J. M. Wickersham, of Pennsylvania; Newton Bateman, of Illinois, among the State superintendents of public instruction; William T. Harris, John Hancock, A. J. Rickoff, J. L. Pickard, George Howland, W. B. Powell, among the city superintendents, and D. B. Hagar, Edward A. Sheldon, Richard Edwards, Francis W. Parker, Joseph Baldwin among the normal school presidents.

However, an overwhelming majority of teachers familiar with the development of elementary schools, it is believed, would place the names of Horace Mann, Edward A. Sheldon, and Francis W. Parker as indisputably the greatest reformers of this period, and to me Francis W. Parker is incontestably the greatest. Horace Mann, outside of Massachusetts and New England and a section of Ohio, was merely an echo from some other world. Edward A. Sheldon had a wider influence in uplifting primary education in the area reached as well as in the extent of his vast personal influence upon his associates and followers; therefore, while less known to the general public because seldom engaged in controversies, and of a more retiring nature than Horace Mann, his influence was more far-reaching and more potent upon the cause of primary education in the United States. As compared with Mr. Sheldon, Francis W. Parker had the whole of the United States for his theater of action. In addition to the qualities possessed by the two other great reformers just mentioned, he had a fire of enthusiasm, a contempt of criticism, a fearlessness of expression, a gift of prophecy, and a belief in the triumphs of the innovations which he championed which endeared him to the hearts of teachers everywhere. Charges of inconsistency had no terrors for him. Insinuations relative to his lack of scholarship, cynical remarks contrasting his position with that of the confessedly great thinkers of his time, did not affect

in the slightest degree his sermons, painting in graphic and exaggerated forms the narrowness and emptiness of prevailing methods in the elementary schools, holding up, like a new Peter the Hermit, a vision of the new life and changes of which he was the prophet. He never hesitated to criticise opposing views, no matter who elucidated them or what the time or place. Every meeting where educators gathered together was to him a forum, an arena, calling upon him to enter the combat.

His life as a teacher may be divided into three periods—that closing with his leaving Manchester, that beginning with his experience at Dayton and ending with his resignation in Boston, and that beginning in Chicago as principal of the Cook County Normal School and ending with his death. The first period of his life was characterized with industry, zeal—often misdirected—and great fondness for children. The second period of his life, beginning at Dayton, is noteworthy as marking his transition from the position of a grammar-school principal, who is seeking to do the best that can be done in the conduct of his particular school, to the higher plane of relating his thoughts and management to that of the best thought of the great teachers of all time. To other men of his time these thoughts appealed perhaps as strongly as to Colonel Parker, but they lacked the strenuous element which, always prominent in Colonel Parker, made him put the expression of his best thought into the schoolroom.

He was not deterred from this by his inability to see the outcome of his experiments or because he could not definitely plan out the various stages of growth through which his pupils would pass, or because he could not answer even in his own mind the objections which were urged against the practicability of doing in the schoolroom what theoretically was the best thing to be done. In the conflict which resulted in Dayton we can see in Colonel Parker the birth of his sweet dogmatism, usually characteristic of the man of action, and at the same time his open mindedness to what came to him from the outside world. It would have been a calamity to the schools of the United States, however, as well as a great hindrance to the development of Colonel Parker, had his triumph in Dayton been so pronounced as to cause him to remain there. His studies in Germany, his acquaintance with the scientific methods of the trained German schoolmasters, gave him the power to clarify his views and also gave him standards by which to gauge the efforts of teachers which made it possible for him to see some things in his profession in a proper perspective.

The story of his coming to Quincy has often been told. Yet in some inscrutable way it has grown to be believed that the schools in Quincy were in a very bad condition at this time. The belief that such was the case among superintendents and boards of education had a pronounced effect at this period in the direction of decrying and discrediting the value of the work done in Quincy during the five years in which Colonel Parker was superintendent. In the report of the very able school committee of Quincy for 1874-75, the year before he was elected superintendent, I find this statement: "At no time within our observation has the average condition of the public schools of this town been so satisfactory." "As regards order and discipline very little fault can be found." "That very much is still to be desired in our system of teaching is too evident for dispute." "That after eight or nine years of constant study in our common schools select pupils should show an amount of acquirement no greater than the examinations for admittance to the high school annually disclose indicates that there is something lacking to the complete efficiency of the system."

There is no reason to believe, therefore, that the schools of Quincy were any less efficient than those of any other towns and cities either East or West. The next annual report of this committee continues: "The committee had long felt the necessity of a gradual remodeling of our system of teaching. If we wished

to keep up with the march of modern improvements in pedagogics it had become essential to introduce important modifications in our method of imparting knowledge." And this bringing up of a whole teaching force in a town to a high plane was the first result of Colonel Parker's work in Quincy.

Coming at a time when the State of Massachusetts was beginning to formally recognize the necessity of skilled supervision of city and town schools the object lesson set forth in Quincy, the challenging of existing methods of teaching and of school management, in the forceful, exaggerated terms presented by Colonel Parker on every opportunity, compelled the opposing forces to draw their lines of demarcation in such a way as presented the issues at stake clearly and definitely before the people. The accessories of an able and progressive and open-minded school committee in Quincy, the development and establishment of a number of ably edited school journals which presented from time to time the salient elements of the controversy, the interest of the newspapers, attracted doubtless by the new features of Colonel Parker's utterances—all these conspired to give a laudable publicity to the experiment in Quincy which every other school reform movement of our times has lacked.

Within an appreciably short time, therefore, the attitude of teachers and school officers toward the discipline in elementary schools changed in the most remarkable manner. The first result of this was the development of a new spirit in the schools, that spirit which our foreign visitors in 1893 thought so wonderful and found so general. Such a condition as is here set forth had an immediate indirect influence upon the teaching in the schools. With the development of freedom in the elementary school came the necessity for better teaching. When rigid military order was no longer possible chaos and disorder immediately appeared, unless the children were interested in their studies. The hearing of lessons, the setting of definite tasks away from and outside of the interest of the children, immediately became very much more difficult, and along the lines of least resistance came a wonderful development of skill among the teachers of the lower grades of the elementary school. The real development of the successful summer school, and the great renaissance of elementary teaching, sprang very largely from this conscious need of teachers to fit themselves for existence in this new atmosphere.

Professional study was, as it were, a necessity, and those teachers who ignored this necessity were soon made conscious of their delinquencies. What might have taken twenty-five years to accomplish was rapidly gained in almost as many months.

Measured from this standpoint, Colonel Parker was incomparably the greatest force for educational good that the elementary schools of this country have ever known. To him more than any other man is due the fact that the schools of the whole country have been decrystallized and imbued with sweeter and higher ideals, and therefore raised to a higher standard of efficiency and accomplishment. He lived to see his views and phases of methods which had been characterized as "theoretical," "visionary," "impracticable," "foreign to our civilization," "tending in the wrong direction," "leading to vast expenditures," "impossible to relate to our common schools," formally accepted by everyone in authority.

One of the most remarkable things connected with the administration of Colonel Parker as superintendent of schools of Quincy is the fact that notwithstanding the immensely bettered condition of the schools, consequent upon lifting the teachers to a higher plane in spirit, skill, and efficiency, the amount of money expended for the support of the schools in Quincy was no greater than that of the years preceding his administration. When one takes into consideration Colonel Parker's well-known weakness and distaste for financial administration, one is at a loss to understand this great achievement at the outset of his career when contrasted with his experience at Chicago. Colonel Parker, during the whole of his

life, was a tremendous indirect force acting upon the schools of the country through the education of teachers under his supervision who were continually drawn upon by school systems in other sections of the country. Great as was his influence at Quincy and in Chicago, tremendous as was the development of the schools under his charge, that growth would have been infinitely greater had it not been so impossible for him to keep any large proportion of the teachers to whom he gave new ideals and greater efficiency. Therefore both in Quincy and Chicago his teaching force was continually changing and shifting—capable and efficient teachers continually accepting better positions elsewhere and leaving their places to be filled by more or less undeveloped teachers.

Nearly all the valid criticisms that have been made against Colonel Parker's administration in Quincy and Chicago have been based upon observation of the work of some of these more or less inexperienced teachers who were in a stage of transition toward better methods.

It was a fortunate thing for the cause of education when Colonel Parker resigned in Boston that he chose the principalship of the Cook County normal school rather than the superintendency of a large city in the East. He was so constituted that he was happier and more efficient in situations where he could see with his own eyes all that was going on than where he would need to operate and direct through many intermediaries. The West, too, was more ready to listen to the new prophet, more willing to change the point of view, more ready to welcome what seemed to be an improvement than older sections of the country.

Pearson, in his *National Life and Character*, points out that in England the mental attitude toward any new invention or new process is always, "This can not amount to anything, or it would have been discovered long ago;" while in the United States and in England's colonies the attitude is, "If this invention is a good thing and this process is valuable, we want it." The West, with few vested rights, with little self-complacency, with less settled society, with fewer recognized great names in education, is not always discriminating in its welcome to new prophets, but is always open minded. The time, too, was ripe for the appearance of a new force. More or less stability had been given to the scattered forces in the schools of the West through the efforts and influence of John Hancock, in Cincinnati; Andrew J. Rickoff, in Cleveland; William T. Harris, in St. Louis; A. C. Shortridge and George P. Brown, in Indianapolis; Richard Edwards and E. C. Hewitt at Normal, Ill., and J. L. Pickard, in Chicago.

The impulse toward improved methods and better schools which had emanated from these centers had extended so far through their ever-broadening circles of influence that a general agreement had been almost reached, and the schools were proceeding in a steady and slow movement upward. It was at this time that Colonel Parker, with his enthusiasm and beautiful personality, appeared to disturb this general feeling of satisfaction which was fast possessing educators in the West.

The Cook County normal school was then a most excellent school, limited in various ways and provincial in others. Under Colonel Parker's management the standards for admittance were raised; the attendance largely increased, coming from almost every State in the West. The quality of the teaching in the school kept improving constantly in all of the elements which go to make up enthusiastic and scientific teaching. With a school growing largely in numbers, extending its influence so that it became truly national, drawing to its corps of instructors teachers with reputation and ability, it was certain that the cost of such a school would continually increase. Because of this fact and because of Colonel Parker's singleness of purpose to elevate the school, he came in contact with both conservative and reactionary forces to such an extent as would have discouraged any man with less hope and less enthusiasm and less strenuousness in his nature; but not

withstanding these troubles which seemed to gather around him, his magnificent personality carried the school in its accomplishments and efficiency higher and higher until it was the recognized professional school for teachers in the West.

During this period of his career his addresses before county and State teachers' associations, his connection with some of the great summer schools, continually widened and added materially to his increasing reputation. He therefore became really a national character—the one great leader whom teachers in elementary schools recognized as their apostle.

Every movement which has affected for good the efforts of the teachers in our elementary schools in our time certainly gained potency largely from the influence derived from Colonel Parker's life work.

Every pupil in these schools has been given advantages and opportunities, and every teacher has been influenced in her struggle for more light, by the great educational movement for which Colonel Parker will ever seem to stand sponsor. His judgment of men and women who taught with him has been wonderfully borne out by their rise and influence. Indeed the history and development of the new education in the United States might easily be written from the growth and influence of those teachers now living who have been associated professionally with Colonel Parker.

We in our time shall not see his like again.

## CHAPTER V.

### THE WORK OF CERTAIN NORTHERN CHURCHES IN THE EDUCATION OF THE FREEDMEN, 1861-1900.

By A. D. MAYO, LL.D.

CONTENTS.—The American Missionary Association.—The Freedmen's Aid Society of the Methodist Episcopal Church.—The Presbyterian Church (North) in connection with the schooling of the freedmen.—The Protestant Episcopal Church in the education of the colored race. The Society of Friends in the education of the colored people of the South.—The Baptist Church of the Northern States in the education of the colored race in the South.

---

#### THE AMERICAN MISSIONARY ASSOCIATION.

The first and still the most notable of the several great missionary associations for the training of the negro race in the Southern States, through schools of every grade and the ordinary methods of mission work employed by the Evangelical Protestant churches in the Northern United States, was the American Missionary Association. It was incorporated January 30, 1849, with a constitution containing ten articles. Article I announces its purpose "to conduct Christian missions and educational operations, and diffuse a knowledge of the holy Scriptures in our own and other countries which are destitute of them, or which present open and urgent fields of effort." Its active and voting membership was limited to persons of "Evangelical religious opinions, who profess faith in the Lord Jesus Christ, \* \* \* not slaveholders or in the practice of other immoralities." An additional fee of \$30 constituted a life member; although "children and others who have not professed the faith may be constituted life members, without the privilege of voting." In a footnote, the term "Evangelical faith" is explained as in accordance with the Puritan creed. In Article VIII the antislavery clause of the organization is emphasized by the declaration that all its operations shall tend "particularly to discountenance slavery, by refusing to receive the fruits of unrequited labor, or to welcome to its fellowship those who hold their fellow beings as slaves."

As at first organized, during the twelve years previous to the opening of the civil war, the operations of the American Missionary Association do not especially concern the object of this essay, since there could evidently have been no field through all the fifteen slave States for the operation of an association that even refused to accept the money or the personal cooperation of slaveholders. Up to 1861 it was a general missionary association of the strict antislavery type, including all persons of the different evangelical denominations desirous of using a society freed from cooperation with one specified class. But the breaking out of the civil war and the drifting of large numbers of negroes from the plantations of Virginia to the army of Gen. B. F. Butler, with headquarters at Hampton, for the first time opened a wide door for missionary activity, which during the past forty-one years has never been closed. It has been stated in a paper which appeared in the preceding Report of this office that the first school for the "contrabands" was opened

by a woman, Mrs. Mary Peake, at Hampton, under the guns of Fortress Monroe. At the close of a three-years' service as agent of the Freedmen's Bureau in ten counties of east Virginia, Gen. S. C. Armstrong found a school of 1,500 colored pupils housed in the old hospital barracks and in the Butler School in that vicinity.

During the fourteen years after this first appearance in the schools for the colored race the work of the American Missionary Association grew apace. Between 1866 and 1870 it received \$243,753.22. The Freedmen's Bureau, on its retirement from educational work, passed over a large sum of money to it, which was expended in the erection of the first buildings of the schools at Hampton, Va., Nashville, Tenn., Charleston, S. C., New Orleans, La., and other places. It is estimated that the people of Great Britain contributed not less than \$1,000,000 in money and clothing for the colored people during these years. During this period the foundations of several of the association's most important schools were laid. Its first report after the close of the war appeared in 1869-70.

At an important convention held at Chattanooga, Tenn., November 24-26, 1869, reports were received from the churches established by the American Missionary Association (all open to a mixed membership of white and colored) and representatives from the schools already established appeared. At this initial period the new public-school system of the South, though recognized in the revised constitutions of all the reconstructed States, was not in a condition to supply the wants of any class. Indeed the aspirations, especially among the lower orders of the white people, and the discontent among the better sort with the policy of reconstruction, largely under negro rule for four years, found constant vent in opposition to the teachers and directors of the schools. If the negroes were to be educated at all, it seemed necessary that the work should go on under the direction of the same agency that since 1863 had been so active among great numbers of the colored masses. But from 1870 to 1876 the association failed to receive the assistance of the National Government, either by supplies or by personal protection from the remnant of the Army of the United States gathered at military posts through these States. The well disposed among the white people and the new State governments were greatly shorn of their power or influence to prevent a reign of disorder.

It was a mercy, under such conditions, that educational work should be in connection with a missionary enterprise, and really under one direction. And, although the people and clergy of most of the great Northern religious bodies had long since outgrown the church parochial system of schooling the masses at home, yet under the patronage of the educational missionary societies for the colored people a system of parochial schools for the negroes was placed upon the ground that is not yet abandoned. The American Missionary Association, now practically one of the great missions of the evangelical Congregational Church (the denomination under which the common school originated and was developed during the entire colonial period in New England), had never used this parochial church system of schooling to any great degree, and retired from it earlier than any other. It can not but be regarded as a misfortune that this system should have been so early associated with popular education in the minds of the better class of the Southern negroes that it has been very difficult to eradicate it, and at present, in many ways, it acts as a serious obstacle to the improvement and proper working of the common school of the American type in every State of the South.

But good things can not always be done, in the beginning, in the most approved fashion. The American Missionary Association took up the work among the negroes as it came to hand. It found the churches far more disposed to contribute funds, and teachers were more willing to go forth to a life of toil and sometimes of peril, uniformly of social and religious neglect by the Southern people of their

own color, in connection with an organization supplied and backed as was this association. In the reports of the American Missionary Association at this time we come across much information concerning the more important schools which, under different names, "universities," "colleges," "institutes," etc., have given their full influence and wrought with great success in the uplifting of the children and youth of the negro race.

It is impossible in this essay to give more than a glance at the different institutions or localities through which this great association for the past forty-one years has wrought for God and humanity and the general welfare of the Republic. A few brief notices will give the trend of its work, and the voluminous publications of the association will supply the interesting details.

In October, 1869, Avery Institute, at Charleston, S. C., was opened with 325 pupils, "mainly of the better class of colored people in the city." Besides this, there was in Charleston a school for colored pupils, established by the family and friends of Col. Robert G. Shaw, who lost his life at the head of his colored regiment in the onset on Fort Wagner; another school under Northern Presbyterian protection, and one sustained by the Episcopalians. The city of Charleston had already moved in the establishment of a free public school for the same class, of 900 pupils. In connection with the Avery Institute general missionary work was carried on among the negroes. All these agencies were also concerned with charitable work, and distributed large amounts of clothing and supplies and rendered assistance of various kinds, of which no estimate has been attempted in computing the pecuniary cost of the work during the past forty-one years. During the period of reconstruction a large school for colored youth was opened in Charleston by Mr. L. Cardozo, a free man of color and a graduate of the University of Glasgow, Scotland, where the Latin and Greek languages and other branches of secondary and higher education were taught. Cardozo and his brother became noted political officials in the reconstruction government of the State. This school contained 1,000 pupils and 20 teachers. The teachers of the American Missionary Association schools were gathered from the great body of churches to this attractive field, or had been employed in similar work during the war, or were known as friends of negro education.

Atlanta University, at Atlanta, Ga., was also getting upon its foundations. President E. A. Ware, of Connecticut, one of the most admirable of all the men connected with this early work, commenced in April, 1870, and presided over the building operations—a dozen of the colored boys armed with shovels digging for the foundations. President Ware read the proclamation of President U. S. Grant on the ratification of the fifteenth amendment, and made a few very stirring remarks. This proceeding is thus noticed for its historical value and because it is a fair representation of the spirit of these schools at the advent of the new order of affairs, to which Atlanta University has already been a large contributor.

In Louisiana, as already shown in the paper before referred to, the common school system, established by Gen. N. P. Banks in 1864, had gone the way of all positive attempts to anticipate the coming of the new education. Before the close of the war the American Missionary Association had sent to this State a band of 26 missionaries and teachers. The public schools opened by the arrangement of General Banks were under the superintendency of Maj. Rush Plumley, of Philadelphia. After the failure of this movement there had been no public schools in the State, outside of New Orleans, until 1869. The school law enacted that year was almost impotent, from lack of funds and organization and the want of local interest, and in 1870 it was estimated that at least 85,000 colored children in the State were without any educational privileges whatever. The American Missionary Association, in company with the Northern Methodist and Baptist missionary bodies, came to this inviting field, sustaining more schools in

the rural districts than all other agencies combined, aided by the Freedmen's Bureau as long as it was in operation. In 1870 it supported 50 teachers with 3,000 children in as many as 80 schools. Children were accustomed to walk 12 miles a day to attend these little district schools. The people could pay the board of the teacher if the schooling could be given. But it is also recorded that, as soon as the State came under the charge of the original white population, the American Missionary Association withdrew from this elementary work to give its attention to the secondary, higher, and professional grades. Straight University had already been founded, by the investment of \$25,000 in land and buildings in New Orleans, contributed by the General Government through the Freedmen's Bureau, and soon announced itself as "incorporated in 1869, with the power to confer all such degrees as are conferred by universities in the United States."

The exalted titles of the schools established by this and other of the Northern educational missionary bodies have furnished occasion for a great deal of ridicule, which might also be applied to the same mischievous habit, in many portions of our country, of magnifying the character and grade of schools by the magnificence of their titles. There can be no doubt in the minds of the most reliable educators that this practice has been especially harmful to the genuine advancement in letters of the first generation of these children and youth gathered in schools, especially coming with the virtual indorsement of the churches of the Northern States to a people sunk in dense ignorance. It can, however, be truly said that the teaching faculties of all these seminaries have largely recognized the actual situation and labored as faithfully in laying the foundations of an elementary education as if they did not bear the learned title of professor or president. For many years the best of these schools were only of the secondary rank, and in the most successful only a meager half dozen of the 500 pupils in attendance could be pushed up to a college graduation. At present the majority of these seminaries are accepting the situation and giving to their pupils the mental fare adapted to their capacity, with a growing emphasis on a sound English education, the proper training of teachers, and industrial theory and practice in great variety. The great work, of course, has been in the field of religious, moral, and social advancement, in which all these seminaries have wrought with undisputed ability and success.

The new school at Hampton was at first largely aided by the American Missionary Association, which has always been its "next friend." But under the administration of Gen. S. C. Armstrong it was organized as an independent corporation with 6 teachers and 75 students. The institution received its charter from the legislature of Virginia, by which it was subsidized at the rate of \$10,000 a year for the industrial training of its pupils; but its government from the first was in charge of a board of 14 trustees, including men like Gen. O. O. Howard; President Hopkins, of Williams College, Massachusetts; Hon. James A. Garfield, of Ohio; State Superintendent of Public Instruction B. G. Northrup, of Connecticut; and President R. E. Strieby, of the American Missionary Association.

At Wilmington, N. C., 800 pupils were instructed by the night schools of the American Missionary Association. "Three-fourths of the colored children of the State are living in ignorance. There are no sufficient schools for the colored people and there can not be till their young men are educated. There are but few colored men fit to hold civil office. We are trying [say the managers] to reform the religious worship of the people, so much of which is degrading and demoralizing."

To far-away Florida the American Missionary Association had gone. At Jacksonville during the war, in 1864, the opportunity of schools for colored children had been furnished under the supervision of the military. April 10, 1869, a normal institute had been opened, two stories high, with a library and apparatus, and rooms and arrangements for 300 pupils, at a cost of \$16,000. There were

400 pupils, chiefly under the care of Mrs. Williams, of Deerfield, Mass., and 300 children were in the white schools. It is declared that this was the first normal school building erected in Florida. The State had already moved in the establishment of common schools, and it was compelled to look to the normal institute for the teachers of the colored children.

In Alabama, in the beautiful city of Montgomery, on a high hill fronting the State capitol where Jefferson Davis eight years before took the oath of the Presidency of the Southern Confederacy, was organized a school of 450 colored children and 10 teachers, in a fine building; the best schoolhouse then in the city. The teacher reports that he has "a normal class of 16 of the most promising young men and women it has been my privilege to see in any school, white or colored, south of the Ohio River." The superintendent of public schools, after examining 11 of these students for service in the adjoining county, says, "they were the first colored teachers we sent out to the country. They took the carriage in sight of the capitol where Jefferson Davis took his oath as President; where the first Confederate Congress met and sent the message 'to open on Sumter,' and in sight of the barracks where still hangs the sign 'Negro barracks,' where their fathers and mothers had been sold as slaves."

Berea College, Kentucky, situated at the foot of the great mountain world of the Central South, a region as extensive as the German Empire, inhabited by 2,000,000 people, generally loyal to the Union during the war, but still in the most primitive condition of civilization of any class of native-born people in the country, had been organized before the war by Rev. J. G. Fee, who, during the conflict, had been compelled to leave the State while endeavoring, at the risk of his life, to school the negroes. In 1869 it held its fourth commencement in the presence of one to two thousand of the country people. This college is the only school of similar rank that has been able to exist and steadily grow weighted by the union of the two races among its students and teachers.

Fisk University, at Nashville, Tenn., named from Gen. Clinton B. Fisk, one of the most active of the army men in the employment of General Eaton in the educational work in the valley of the Mississippi, had an attendance of 250. This school will long be remembered in connection with the tour of the first group of "Jubilee Singers," who went from State to State and to England and Germany, singing the old plantation melodies. They literally sung up the walls of the first college building for colored youth in Tennessee, the parlors of which are adorned by the portraits of some of the most distinguished personages in Great Britain. These children of freedom were welcomed everywhere and even flattered by the crowned heads of the Old World.

To Mississippi, at Tougaloo, near the capital of the State, indeed, to every State of the South, the American Missionary Association sent forth its missionary teachers, among them many women of large culture, high character, and social standing, to labor among the colored children and youth. In addition to the laborious office of teacher and practically mother, these excellent people were burdened with the responsibility of preparing their crude and wayward constituency for the "grand and awful time" to which they had been awakened as by "the new Jerusalem coming down from Heaven, adorned with shining grace."

At Washington, D. C., Howard University, a seminary of the secondary academic, higher, and professional education, had been established as one of the first of its kind and subsidized generously by an appropriation from Congress. As in other schools, the American Missionary Association was interested in its beginnings, although it is now an independent corporation, receiving an annual grant from Congress. There were 506 teachers and students at Howard, representing the sixteen former slave States and the District of Columbia.

In 1870 the American Missionary Association was furnishing education to 21,840 pupils. Besides this it was doing a great work in other directions. Its teaching and missionary force numbered 3,161. The reports from the field secretaries in 1870 showed that the new public-school system was beating its way up to success against great opposition, although the disordered state of political and industrial affairs was largely responsible for the resistance. In several of the States, as in Virginia at Hampton, the legislature cooperated with the American Missionary Association by subsidies for their schools. From this time the Freedmen's Bureau withdrew its aid from the American Missionary Association. It had disbursed \$213,000 for Southern education through this agency. One of the most vitalizing forces of this early work was the religious zeal and consecration which surrounded it with an atmosphere surcharged with power and love. The teachers all worked on what would be a pittance in the North, and assumed burdens in and out of school hours that, of themselves, would often appear to be a hardship in any well-organized community. They lived in crowded dormitories with their students, generally partaking of the inferior diet which, although often better than these scholars had ever known, was of a quality ill-adapted to their own health. They were always in reach of these children, who needed everything, and obliged to sustain a relation far more resembling a public reform institution than a school. The very nature of the work developed in all its superior workers an exaggerated and often a morbid sense of responsibility, which held them to their posts with the courage of a soldier on a perilous outpost, only to be vacated at the risk of disgrace and maintained at the great risk of collapse of health. Numbers of these excellent teachers laid down their lives in this work as certainly as the soldiers who fell in battle; indeed, comparatively few of them have ever been able to bear the strain of the work for a long succession of years. Of course they were not received in any proper social or even religious fellowship by the white people among whom they came to serve. Yet there were noble exceptions to this exclusiveness, and many a lifelong friendship dates from an acquaintance formed during these years of service in the Southland. It is probable that this phase of the situation was unconsciously exaggerated, especially by the women teachers. Their schools were generally established at a distance from the social center of the villages and cities in which they were situated. At that time there were few or no means of rapid transit, even in the larger towns. The teachers were generally overworked and unable to place themselves in the way of making acquaintances, perhaps sometimes, although very useful in their work, without the social interest or tact to make their way in this respect. The people whose social acquaintance would have been a pleasure were themselves, to a great extent, under a cloud, often of personal affliction, made doubly severe by the straitened circumstances that forbade the old-time social hospitality, and under the peculiar circumstances made it next to impossible to seek new friends among the teachers of their former emancipated slaves. The class most accessible, not only to the men but to the women, consisted of the public men, the physicians, superior teachers, and public-school officials, who were more frequently brought in contact with the mission schools, and from the first were glad to avail themselves of all the service in conventions, institutes, etc., which the newcomers had the strength and time to afford. It can truly be said that there was no considerable portion of the superior people of the South who ever showed any persistent and public hostility to this work.

The reports of the teachers, missionaries, and agents of the American Missionary Association in these years read like a perpetual romance, and in future years will be regarded by the historian, poet, and educator as most valuable material for the illustration of this period. This peculiar condition continued until as late as 1880. One hundred years hence the vast body of publication that grew up around these

schools will furnish the material for an important division of our new American literature. Especially will the historian of education, who at the beginning of the second century of the Republic seems to be just coming to a sense of his place in the national literature, find in these interesting records of the adoption and the rehabilitation of the former things the wondrous versatility of the American people, making the Republic itself the world's "nation of all work." The spectacle of more than five millions of slaves coming up from the darkness of centuries of pagan barbarism through the experience of two hundred and fifty years of chattel bondage into the possession of full citizenship in the world's chief republic was also a demonstration of the power of Christianity and the progress of humanity never to be left out of the history of mankind.

It may be noticed that by 1880 the American Missionary Association, which at the beginning had included a large constituency from the different evangelical Protestant denominations, had finally become a representative of the evangelical Congregational churches of the country. In 1881 a constitutional revision of the charter adjusted the association to its new position. The thirty-fifth annual report places its expenditure for educational work among white and colored children and youth at \$186,398.97, and its entire expenditure for all purposes at \$244,578.96. The State of Massachusetts had furnished \$150,000 of this sum. In addition to this the association had received for education through State aid for colored schools and in various other ways large sums in money and supplies. Its educational outfit in 1880 was 8 chartered institutions of the higher education, under the titles of college, university, and institute; 111 high and normal, and 35 common schools; instructed by 230 teachers and missionaries.

In 1886, at the end of forty years of work, the association moved on a new line of work among the 2,000,000 of white people in the great central mountain world of the South. Out of this population had come two of the Presidents of the United States—Abraham Lincoln and Andrew Johnson. This class of the Southern people, by a large majority, was favorable to the Union during the civil war and furnished a most efficient section of the Army of the Southwest. But the masses of these people twenty years after the dawn of peace remained largely illiterate. From the center of operations at Berea College, Kentucky, with which the American Missionary Association had always maintained a friendly relation, a group of valuable schools has come up under the direct control of the association, into which an increasing number of the more ambitious and intelligent of the young mountain people have been gathered. Several of these seminaries are established in the new villages which have been developed by the extension through the vast, and to-day by far the most interesting, portion of the undeveloped country east of the Mississippi River, of the great railroad systems connecting the East and the West, and have proved themselves among the most notable agencies in the uplifting of the people of the entire district.

In 1888 the American Missionary Association was reenforced by the generous gift of \$1,000,000 by Mr. Daniel Hand, an aged retired merchant, residing at Guilford, Conn. Mr. Hand was born in 1801, of good Puritan stock, and until the age of 18 worked on his father's farm in Connecticut. In 1818 he removed to Augusta, Ga., entering into business with his uncle, an old merchant of that city and Savannah. Daniel Hand succeeded to the house and, up to a few years before the breaking out of the civil war, was a leading member of the firm. Fifteen years before 1860 he admitted Mr. G. W. Williams, of South Carolina, to a business arrangement in which the partners had an equal interest. At the breaking out of hostilities Mr. Hand was at the head of the capital invested in Charleston. During the war he resided at Asheville, N. C., relying upon Mr. Williams in Charleston for the general charge of affairs. After a great deal of litigation, largely through the personal influence of his old partner he saved the house from

wreck. At the age of 88 he made this great bequest to the American Missionary Association. He wisely left to the directors of the association the manner of its expenditure, premising that only the income should be expended annually and suggesting that it should be used largely as a student aid fund of \$100 a year for promising students.

With this reenforcement the association launched out in a wide expansion, so that it subsequently found itself involved in a debt that compelled immediate attention. The sinking fund of \$100,000 was established and a policy of economy adopted.

At the jubilee meeting in 1896, held in Boston, the association was welcomed by the governor of the State and the mayor of the city, and the sermon was preached by Dr. Lyman Abbott, editor of the Outlook, successor of Rev. Henry Ward Beecher, of the Plymouth Church, Brooklyn, N. Y. The receipts of this year were \$340,798.65 and the expenditures \$311,223.35; the debt having decreased from \$96,000 to \$36,000. The income of the Hand fund was \$68,830. This year was the fiftieth anniversary of the association. The will of Mr. Hand had left a large additional sum to the cause. From 1860 to 1893 the expenditures of the American Missionary Association in the South nearly reached the large sum of \$11,610,000. In 1898 the association reported 6 chartered institutions, 44 normal and graded and 27 common schools, with 413 teachers and 12,348 students.

Of all the mission educational enterprises of the Northern Protestant evangelical churches, the American Missionary Association seems to have borne in mind most completely the idea of working in connection with the Southern States and people in the upbuilding of the common school for the colored race. It has, more than others, discouraged the mischievous habit of engrafting the old-time parochial school on the churches that have been developed by its missionary activity. In three of these States—Virginia, Mississippi, and Georgia—at different times its larger schools have been subsidized by the State in the interest of their normal and industrial departments. It has not shown the usual desire to retain its original authority or to utilize its bounty to acquire the perpetual educational control of its schools. Four of the most important schools of the higher order with which it has been connected and which have been liberally aided by it are now entirely separated from it—Howard, Washington, D. C.; Hampton, Virginia; Berea, Kentucky, and Atlanta University, Georgia. The explanation of this may be found in the fact, already stated, that although the American Missionary Association first united with several of the evangelical Protestant churches in its work among the colored people, each of these associations in turn has preferred to separate itself from others and organize on a more decided and exclusive denominational basis, looking to the church it represents for its support and guided by the sectarian policy thereof. This has left the American Missionary Association, like the A. B. C. F. M., virtually in charge for the evangelical Congregational Church. It was in New England, which for one hundred and fifty years of the colonial life was exclusively committed to this form of Congregational Church government, the only ecclesiastical polity that owes its origin to the Christian people of this Republic, that the people's common school was developed and alone sustained until the close of the war of independence. That original interest in and connection with the common school by the Congregational clergy and laity has never been lost by the members of this great and growing religious organization. It has not, like the three great remaining Evangelical Protestant churches, been ruptured by a sectional secession from the original body; as, previous to the close of the civil war there were, outside a few congregations in the border cities, no Congregational churches in the Southern States. Hence it has been called to encounter no sharp conflict with a rival church of its own household and has been left more exclusively to the radical work of preparing the colored race for a

superior form of religion through a general uplift of mental, moral, social, and industrial life, in which all the habits and the general spirit of society will become the most powerful teachers and the new citizenship of the race become at once a university and a church. There is nothing in the idea or the policy of the American Missionary Association that will forbid any or all of its present educational foundations, as new times and changed circumstances might demand, to retire amicably from its denomination control and become independent or even State institutions for the mental, moral, and industrial training of the class of students that has always been found under its benign and progressive influence.

In 1891 the American Missionary Association reported 8 schools of the higher and secondary type, 4 seminaries for the mountain whites in North Carolina, Kentucky, and Tennessee, 2 for Indians in Nebraska, and 93 other normal, industrial, graded, and primary schools. Its church work is almost entirely confined to the very poor among the Indians, and the lowland colored people of the South, with a growing interest for the people of the Southern mountains. Altogether there are 106 schools, with 15,252 pupils, and 242 churches, with 708 missionaries and 12,995 church members, the majority in the South. A bureau of woman's work is connected with the association.

#### THE FREEDMAN'S AID SOCIETY OF THE METHODIST EPISCOPAL CHURCH.

The first report of this society furnishes a complete account of its organization in 1866, the reasons for it, and its preliminary operations until May, 1868. It was established in response to a call, dated March 8, 1866, and signed by Bishop D. W. Clark, representing the board of bishops of the Methodist Episcopal Church. During the progress of the civil war the original work for the Freedmen in the North was carried on by a variety of Freedman's aid associations formed in Boston, New York, Philadelphia, Cincinnati, and Chicago during the years 1862-63. The first call was for the relief of the physical condition of the "contrabands," and it has already been related how this aid was dispensed largely through the agency of the Union Army, while supplies and money were forthcoming from these and private agencies. In 1864 the general conference of the Methodist Episcopal Church indorsed these additional methods of charitable aid. But as early as 1862-63 the call was made for additional effort in behalf of the mental and moral elevation of these people. Teachers were sent to the seaboard in 1862 and to the valley of the Mississippi in 1863. The physical needs of the Freedmen were so well supplied by the arrangements for their self-support on the vacated lands and in the Army, as soldiers and laborers, that after 1863 the chief need of assistance was for the maintenance of schools and teachers.

The beginning of this great work seemed at first to be an open door of invitation by Divine Providence for the long-desired and prayed-for, but slow in coming, union of the different divisions of the Protestant Church in some one grand and voluntary enterprise for the uplift of humanity. But it was soon found that here the churches were the first to break the bond. It was decided that the educational workers among the negroes should be members of the churches of the evangelical type of creed. This, of course, would leave outside the large majority of the American people whose "good will to man" was manifested by undenominational and practical labors and sacrifices, rather than through the regular channels of church work. First of all, the Friends, then the United Presbyterian Church, in 1863, inaugurated special denominational work among the freedmen. Later followed another division of the Presbyterian, and the United Brethren, and one type of the Baptists. In 1864 a committee was chosen by the old-school Presbyterian Church (North) for the subsidizing of a proper missionary work.

The Congregational Evangelical churches in 1865 reorganized the American

Missionary Association, that had existed since 1849, and reconsecrated it to this special work, and proposed to raise \$250,000 per annum for this purpose. In the same year the Methodist Episcopal Church organized "The Freedman's Aid Society," and the Northern Baptists of the regular "persuasion" called for \$100,000 as a fund for denominational work in the South. The five leading commissions already on the ground had fallen apart, the two in the West as a rule employing members of the evangelical churches as teachers, while the three in the East—Boston, New York, and Philadelphia—did not make church membership a necessary qualification for any position in the work. By 1866, despite vigorous efforts to combine these organizations in one free-school society, every teacher from the undenominational societies had been displaced and every Protestant religious sect save two had adopted special plans.

It was inevitable that these great ecclesiastical bodies should all, in time, come to see that the field of denominational missionary effort for the final evangelization of the 6,000,000 of the freedmen and the legitimate propagandism of their own churches was such as had never before been opened. In place of sending the missionaries of the cross beyond the sea to distant heathen or Mohammedan lands, all under foreign governments which were not always friendly to such enterprises, here was a new American citizenship of 6,000,000 of our own freedmen, just emerging from two hundred and fifty years of bondage, needing almost everything, with an ardent desire to "learn their letters," and receive aid and comfort of all kinds from the North and the nation to whom they were indebted for their new-found freedom.

The report of the Freedman's Aid Society referred to declares, however, that they were more anxious to have schools for the freedmen and their children than even to consider the founding of missions. This was very natural, since during the period of their former slavery the negroes had all nominally been converted from paganism to about as much of Christianity as was possible for a people in their condition of ignorance and dependence. Their new religious zeal, as usual, took the form of a direction to their own former denominational bodies, largely Baptist and Methodist, and often became a superstitious and fanatical caricature of the more enlightened denominational spirit of these great Christian sects.

The desire to preach was very pronounced among the leading class of the freedmen, and it was soon apparent that one of the first uses of their liberty was to be the formation of great religious denominational bodies which, under the old names, really were the beginning of a church organization founded upon and representing the then existing condition of religious and moral culture among these people. The white clergymen of the South, although often greatly honored for their zealous "labors of love" among the slave population, were generally dispensed with at this crisis in the new life of the race. It was therefore natural that all the Northern churches and clergy of the evangelical type should hasten to provide for the then vacant pulpits and buildings, and on the strength of such work as they had done before the war, and their patriotic services during the four years of the sectional conflict, endeavor to take the reins and direct the civilization of the rising race. In the words of the report, "The control of the educational work connected with missions was as necessary to success as the work itself, and this necessity, soon observed by every denomination that entered the inviting field presented by the South, was the chief care and guidance of denominational schools."

Of course, by this decision, the church abandoned the ground already taken by the northern American people, that the most effective and reliable moral agency for educating and training American children and youth was the undenominational common school. This conclusion had been slowly reached through the

experience and perpetual conflicts of the two hundred and fifty years since the passage of the original public-school statute by the Massachusetts Bay Colony in 1647. While a majority of the ecclesiastical organizations did favor the establishment of the American common school in the reconstructed States of the South, and the more advanced of them retired from the support of primary schooling for the negroes as fast as it was supplied by the States and communities where they labored, and made it a permanent feature of their policy to train teachers for all grades of these schools, the schools of the Methodist Episcopal Church were, at first, as far as possible, connected with churches. In 1868 the majority of the school teachers were the missionary workers, the same buildings being used for the school houses and churches, and the administration of the entire enterprise was so interlocked that it would be impossible to separate in any way the exclusively educational plant.

But the inevitable tendency of American thought and action in respect to universal education planted every Southern State, by 1870, on the American policy of an unsectarian common school, and, outside a few Southern communities, the attempt to subsidize denominational schools in these States has not been a success. In obedience to this condition of affairs and urged by the impossibility of educating 6,000,000 people, all in 1866 practically illiterate, by Northern Christian charity, all these great mission schools, like the denominational colleges and academies of the North, have modified their sectarian character, and to some extent conformed to the policy of similar institutions of learning in the new South. Still, in testing this plan of school education among the negroes, it should always be understood that the only just and correct point of view is the whole field and its necessities as surveyed and organized by the larger Protestant Christian sects, and that the educational was always subordinate and tributary to the need of the religious uplift and moral reformation of these people.

It is not strictly in line with the purpose of this essay to give an elaborate record of the doings and results of this great missionary movement in the South for the past thirty-five years. As a feeder to the common-school system, on which the race must more and more rely for the training of its children and youth for reliable manhood and womanhood and good American citizenship, it has maintained, and must for a considerable period to come continue to maintain, a vital and necessary connection with the founding of the American common school. It will be observed that, more and more, its academical and normal schools are conforming to the methods of instruction and discipline and especially of industrial training that are best known under the general title of "The new education." Still, the fundamental purpose of all these great and useful bodies is the same as that of the churches by which they are supported and also mainly relied on to shape their policy, and whose teachers are chiefly found in all important positions in their school work.

It is not necessary that the most earnest advocate of the American common school in all its departments should look with disfavor or in any spirit of hostile criticism on any of these great schools, which are regarded by their workers in conformity to popular nomenclature as "Christian" instead of "secular." The great work of the moral and spiritual uplift of mankind is the radical motive of these schools, as of the Christian churches, and much as we may deplore the inevitable results of these sectarian divisions and the hindrance to educational development by the contentions and rivalries of the denominational system of schooling in general, there was never a better work done by any people in any land than has been achieved by the results of forty years of missionary and educational activity in the type of schools now under consideration, and there has been no expenditure of time, money, and effort for the general uplifting of God's "little ones" that has resulted in more benefit than has been achieved by the disbursement of more

than \$50,000,000 through the schools and churches in the social and industrial improvement of the colored and white people of the humbler class in 16 States.

The churches of the Methodist Episcopal body of the North responded to the original appeal with remarkable promptitude, although the country was in the agonies of one its periodical spasms of "financial depression." In the seventeen months ending March 31, 1868, \$58,477.69 (\$54,231.73 in cash) was collected, of which \$35,815.83 was expended in field work in 9 States. There were 59 schools with 124 teachers, and, in 1868, 7,000 pupils. Only half the teachers drew full support from the territory and the remainder cost \$10 per month. A large number of the teachers were ministers of the gospel who labored both in church and school, and all the teachers served in the Sunday as well as the day schools. The general outcome of the work could not be better described than in the words of the superintendent:

Our schools have rendered essential aid in the work of restoring social order; in bringing about friendly relations between the employers and laborers; in promoting habits of cleanliness, industry, economy, purity, and morality; rendering more emphatic the grand distinctions between right and wrong, falsehood and truth; enforcing fidelity to contracts; portraying the terrible consequences of intemperance, licentiousness, profanity, lying, and stealing; teaching them to respect the rights of others while they are prompt to claim protection for themselves. The teachers have furnished for the freedmen a vast amount of valuable information in regard to the practical matters of life which could be obtained nowhere else. The schools have met a great want which no military or political organization could supply, and without which it will be impossible for peace and harmony to be restored. Our teachers have been pioneers in the work of reconciliation, and are laying a foundation upon which the most enduring superstructure can be reared.

In fact the only fair and appropriate way of estimating this peculiar combination of church, school, and home in the Southern educational work during the past generation among the negroes is to regard it as a vast university of all work; a continental training in the new American civilization to which the younger generation of the freedmen had been so wonderfully summoned. Like the lyceum of the old and the Chautauqua assembly and summer school of the later times, it was a characteristic development of our American educational life, as sincere and praiseworthy in motive, in social and religious as in industrial and political affairs. As the years go on and the educators of the colored race come to a full recognition of their opportunities and obligations in respect to this class of pupils, much of what was an imperative necessity in the first generation will be dropped and the more important of these seminaries will become the permanent academical, industrial, and collegiate foundations for the increasing numbers of this race. And then it may be seen that the apparent presumption of naming a school of 500 boys and girls in the elements of useful knowledge, the first generation of their people ever gathered in a schoolroom, a "college" or "university," has been justified by giving to the country half a century later a class of institutions of the higher education in the best sense, seminaries of the higher Christian civilization, "universities" more in accordance with the grand ideal of John Milton than are yet to be found in any of the great educational institutions of to-day.

The report for 1868, from which these facts are drawn, was accepted with marked favor by the general conference of the Methodist Episcopal Church for that year, and from that day to the present the Freedman's Aid Society has gone steadily forward along the high road to success. The conference took a wide and practical view of its duties in the situation. In its announcement it says: "When the Southern States are fully reconstructed and a wise common-school system is established, and a returning prosperity shall enable the maintenance of free schools, the work of this society may possibly be superseded. Already the society reports the establishment of three normal schools at Nashville, Tenn., Huntsville,

Ala., and Columbia, S. C." These early normal schools were as yet rather academies, where the superior young colored people received the schooling necessary for a teacher's work, with but little of what is regarded the professional training now everywhere demanded in the teachers of the people's schools. The necessity of help for teachers and preachers is noted in the report. Arrangements were made for the employment and assistance of Dr. Rust, of Cincinnati, Ohio, as corresponding secretary, whose services during many years were so valuable over the entire field of Southern educational work; also Rev. J. M. Walden, afterwards most widely known as the chief traveling bishop of his church, was assigned to this work.

Another decade passes, and in 1878 the eleventh annual report of the Freedman's Aid Society opens a view over a wider field with greater results. The Methodist Episcopal Church has now 28 conferences in the South, 14 largely of white and 14 principally of colored members.

These 28 conferences already contained 396,000 members, although the Methodist Church South and several great organizations of colored Methodists were working in the same field. In this territory there were 6,328 traveling and local preachers, of whom 3,365 were colored. There were 4,381 Sunday schools, with 240,671 scholars, of which 2,022 schools and 96,474 scholars were colored. The church property developed by this ten years' work was valued at \$8,792,716, of which \$1,868,503 was in use by the colored members. Already this great school missionary effort by the different churches of the North had borne abundant fruit. The negroes themselves had not been deficient in zeal, and report 448,000 members of the African Zion and Colored Methodist Episcopal churches of America. One of the shadows cast by the denominational "pairing off" of Northern Christians into church missionary associations was the development of the sectarian spirit in the negro race, while the church parochial school, adopted as a necessary expedient in the early stages of educational work, was now, after a generation, found often to be a positive and obstructive hindrance to the building up of the effective system of common-school instruction, which always must be the agency of civilization to the negro race.

The school work of the Freedman's Aid Society had not lingered behind the church enterprise. Five chartered institutions, with three denominational theological schools, two medical colleges, and ten seminaries of the academical grade were reported, with an attendance of 2,040 students, 1,000 of whom were classed as normal, in 11 States. It was estimated that 64 per cent of the colored people of school age were abiding in the darkness of ignorance. "Of the 5,000,000 colored people of the country—one-third, perhaps, seem to have risen to a higher degree of comfort and a higher phase of life—one-third have sunk down to a lower plane, and one-third are left the victims of circumstances." The report brings to notice the vast field of Christian work open to women in the reformation of the family. "The great opportunity for the women of America is presented in this work, which God has placed at our door." In two of the schools a medical education can be obtained. The financial side of the society gives the least favorable account of itself, reporting \$63,402.85 expended in 1878—only \$3,000 more than ten years before. In the eleven years of its operation the Freedman's Aid Society had disbursed \$715,852.40; 100,000 pupils had been taught by teachers educated in the schools of the society. For reasons not explained the public-school attendance had fallen off in 6 of the Southern States during the year. Even in Kentucky not half the school population had ever been enrolled in the common school. There was still a great field of labor awaiting the fit workers in the building for the children of the South.

In 1880 the writer of this essay began the first of a series of annual visitations among the schools of all sorts in all the Southern States that has continued under

the name of "a ministry of education" until the present day. In the Clark University, Atlanta, Ga., founded by Bishop Gilbert Haven, he found the most successful attempt to introduce industrial training in the mechanical and domestic arts outside the Hampton Institute. This feature has since been developed in the schools of the Freedman's Aid Society to a remarkable degree. On the same college campus as Clark University we now find the Gammon Theological Seminary, the most important of this class in the South, endowed and with belongings even superior to the average of "divinity schools" in the North.

Another decade has passed and the report of 1888 reveals a steady progress. "One theological school, 12 institutions of college grade, 2 medical, 6 normal, 3 legal, and 12 with industrial departments, with 28 academies, have been supported and aided. In these 41 centers of intellectual and moral power 328 teachers have faithfully done their work and 7,682 different students have been instructed, an increase of 10 institutions, 40 teachers, and 715 students over the preceding year." The race question is practically settled on the American policy of "local option." (1) "One society and administration for all people and conferences. (2) Schools among colored and white people, to be so located as to best serve the interests of the conferences to be benefited. (3) There is to be no exclusion on account of race, color, or 'previous condition.' Supervision in schools, as in conferences, is to be by the choice of the people themselves." It is noted that while the attempt to employ the educated class of the colored race as teachers in the mission schools "has resulted only in a partial success in a few fields," the general field open to the colored graduate has been greatly enlarged by the Freedman's Aid Society. During the year a new chapel has been built at Clark, and 8 schools have been designated as centers where college studies could be pursued. The Gammon Theological School has been declared the center of this department, with arrangements for practical theological training, while the 12 academies are restricted to the sections nearest them. Four colored schools, admitting white pupils, were also undertaken. Different courses of study were arranged for every class of schools. In all these institutions there were 4,048 in the collegiate, 269 in the theological, 66 in the medical, 67 in the legal, 1,455 in the industrial, and 3,569 in the academical departments. The teachers in the "collegiate centers" make reports to the superintendents of the pupils pursuing college studies. The society was already in debt \$132,619.41, largely due to the purchase of lands and "building." The managers plead for an annual income of \$380,000, of which the schools were expected to pay in tuition and rent \$48,179. According to an estimate of the society, the population of the 16 slave States was estimated at 12,784,612. Of these 4,715,381, 10 years of age and over, were illiterate, 3,042,435 of the colored race. In the conference of the Methodist Episcopal Church in the South there were 447,016 members, of whom 226,833 were colored. There were 7,326 preachers, teachers, and workers employed. These people were gathered in 48 conferences, 32 consisting of colored and 16 containing only white people.

In the central mountain regions of the South, where the white people were generally loyal during the war, the Methodist Episcopal Church, in 1890, had 100,000 members, organized in 7 conferences. One hundred and fifty thousand volunteers went into the United States Army from that territory. The negro population in this region was very small. There were then 100 Grand Army posts in this region and the U. S. Grant University at Chattanooga was in effective operation. Largely by donations from the Slater fund, under the management of Dr. Atticus G. Haygood, the industrial work in the schools had greatly increased. The society seemed to be fully alive to this important annex to its educational forces. The Woman's Home Missionary Society was founding schools of domestic economy in five of the larger institutions, and the local missionary work had been greatly aided by the establishment of a missionary home located among the people, to be

the residence of the woman missionary and the model for the imitation of the well-to-do colored people. One of these college centers, Claflin University, at Orangeburg, S. C., one of the largest of the schools for colored youth in the South, was for several years a department of the University of South Carolina, under the direction of the same board of trustees as the old college of South Carolina and the military school at Charleston for white youth.

It is unnecessary to continue the record of the great work of the Freedman's Aid Society, the deeply interesting details of which have been written in the annual reports and a bimonthly publication devoted to this work of the association. The Methodist organization, discipline, and instruction in its mission schools are essentially the same as developed in the American Missionary Association. They do not vary in all these denominational schools, save in the polity, and, in some respects, the type of the membership. Few churches have done more of the proper personal school work than the Methodist Episcopal. During the first thirty years of its existence the Freedman's Aid Society expended more than \$6,000,000. Its chief school of the university type continues to be Wilberforce University, in Xenia, Ohio, established in 1857. The 65 institutions supported by all branches of the Methodist Church for colored students, as late as 1895, included 388 teachers, 10,100 students, \$1,905,150 property, and \$650,500 expended in administration. Dr. Hartzell, one of the ablest and most effective workers in the educational affairs of the society, has recently been elected to the office of bishop, and is now established in Africa.

The great development of the Methodist Episcopal Church in its educational policy is one of the notable features of the history of education in the United States during the past thirty years. The Chautauqua Assembly, established thirty years ago by the present Bishop Vincent, a native of Alabama, is one of the most characteristic and triumphant developments of American genius for all educational work. The new American University at Washington, D. C., will fitly crown this half century of effort.

In 1901 the Freedman's Aid Society reports: "From its humble beginning of more than a quarter of a century since, when there was only one teacher, with a borrowed capital of \$800, it has to-day 47 institutions of Christian learning, about equally divided between the negroes and the poor whites, in all the former slave States, with lands and buildings worth \$2,165,000." It is able to declare: "During all these years not a single student or graduate has ever been charged with crimes against virtue." The reports from the schools were most encouraging. The attendance was the largest since the financial panic of 1892-93 and the number of graduates the largest in the history of the society. It is encouraging to note that special stress is placed on the normal department and English branches. "Our aim has been not only to secure good English scholars, as opposed to Latin and Greek scribblers who can not speak their mother tongue, but especially to prepare well-trained teachers." It boasts that it has more teachers in the public schools of the South than any other benevolent institution doing work in that section. After a temporary interruption, caused by the financial panic, the society had taken up its industrial work with new vigor, and asserts: "We have more industrial students, teach more industrial pursuits, and have more graduates than any institution or set of institutions in the South. The total number of students in all the industrial schools the present year is 2,906." The society appropriates \$90,623 annually; \$79,975 to colored pupils, for 1 theological school, 2 medical schools, 10 institutions with the title of college or university, and 10 academies, with 3 universities and 22 academies for white students. It expended for colored schools during the year 1900, \$171,773.01; for white schools, \$47,815.66; total, \$219,588.67, besides a miscellaneous expenditure of \$136,216.79; its total receipts having been \$355,805.46. It still has an indebtedness of \$154,891.34. The presi-

dent of the society is Bishop J. M. Walden, who, with Vice-President R. M. Rust, D. D., and W. P. Thirkeld, corresponding secretary, have been for many years, with Bishop Hartzell, among the best known and most intelligent workers in the Southern educational field.

THE PRESBYTERIAN CHURCH (NORTH) IN CONNECTION WITH THE SCHOOLING OF THE FREEDMEN.

The northern Christian denominational organizations which, at the close of the civil war, undertook work of education among the freedmen of the South, may be divided into two distinct divisions. The first includes the American Missionary Association, representing the Congregational; the Freedman's Aid Society, established by the Methodist Episcopal, and the educational organization through which the Baptist churches operated. Although these were missionary enterprises largely engaged in denominational propagandism, including the establishment of churches, yet in their educational work, which produced great independent and State institutions, of which Hampton, Va., and Tuskegee, Ala., are conspicuous examples, they put themselves at once into the most vital and sympathetic relations with the new common-school system for the colored race of every Southern State. And although for a period they somewhat failed to appreciate the importance of the normal and industrial training absolutely essential to the success of the colored teacher, yet they did furnish for ten years and more a large majority of the teachers for the more important free colored schools in these States. This tendency, despite a persistent ecclesiastical opposition in the management, is now so confirmed that these three great denominations, beyond comparison, retain their leadership in the Southern educational work and are to-day supplying probably the larger number of competent instructors, not only in the public schools, but in the State normal and industrial colleges throughout the South.

Another division of these religious bodies, like the Presbyterian, Protestant Episcopal, the Friends, and several of the smaller sects, adopted at first the same policy as the Catholic Church, not only making their mission schools for both races thoroughly sectarian, but inclined to favor what is called the parochial system of schooling all the way up from the primary school connected with the church to the university.

It was doubtless from the fact that these churches proposed to themselves this persistence in the old European method of education that their success in collecting funds for establishing schools has never been commensurate with their wealth and general importance as religious bodies in this country. The church school of every degree has its uses everywhere, especially in the secondary academical and higher collegiate and university departments. But the educator or churchman, however zealous and consecrated, who proposes the planting of a little parochial-school annex by the side of every colored church, to the exclusion of public schools, must be prepared for the indefinite postponement of even the elementary instruction and discipline of the vast majority of the more than 2,000,000 negroes under the age of 20 years. After thirty years of prodigious effort by the Southern people themselves, aided by great missionary effort from the North, more than 50 per cent of the colored people of the South to-day above the age of 10 can neither read the Bible nor write their own name in a business transaction. The only way out of the inevitable disturbance from such a condition of affairs is the hearty union of the whole people, even better if aided by some practical scheme of national aid, to lift up at least one-third the population of these 16 States, of both races, into line with the American life of the present.

Among the Protestant churches that adopted the parochial school system was the Presbyterian Church, North. As early as 1865 this church had put forth "a

declaration in favor of special efforts in behalf of the lately emancipated African race." Six years later (1871), in the first annual report of the "Presbyterian Committee of Missions for Freedmen," we read that the first five years' work in 1870 had resulted in a financial indebtedness of \$17,789.15, besides an additional burden of \$3,400 for real estate furnished. In preparing the schedule of school work for the year 1871, the committee "reduced it, with but three exceptions, to that which is strictly parochial, dropping with their teachers such schools as had no denominational church connections," with a view to scale the debt. They report \$70,934 as the value of church property. There were 67 churches, upon 6 of which there was an incumbrance of \$5,933. There were 6,220 scholars in the Sabbath schools.

In the year 1871 the entire number of schools was 45, with 58 teachers and 4,530 pupils. Biddle Memorial Institute, at Charlotte, N. C., a theological and normal school; Wallingford Academy, at Charleston, S. C., with 300 pupils; the Normal School at Winchester, Va., with 95, and Scotia Seminary, for colored girls, at Concord, N. C., with 45 pupils, were all the institutions that were supported outside the parochial schools. Complaint is made that the churches do not come to the help of the association, as was earnestly hoped they would, and the general assembly of the year 1871 at Chicago, "regrets to find that the work among the freedmen has not been sustained in a manner at all commensurate with its importance."

In 1872 the expenditures amounted to \$65,802.95. The churches still held back, and the debt was not wholly paid. The number of pupils in the schools had diminished by 1,000 since 1871.

At the Scotia Seminary, for colored girls, at Concord, N. C., industrial training, needlework, and domestic economy were pronounced features. Biddle Institute, at Charlotte, N. C., in 1872 had some 14 Presbyterian churches in charge, was situated amid 8 acres of well-cultivated grounds, the property valued at \$13,000, and had an able corps of teachers for its 100 students. In 1872 the Presbyterian General Assembly approved the work done and the call for \$90,000.

In 1876 the debt was finally paid. The high schools had been opened, the Chester, S. C. Brainerd School had increased to 231 pupils, and an enterprising colored preacher had collected \$4,359 in scattered places for the work. The parochial type of the school keeping was still maintained. The most interesting of the new schools, in 1878, was located at Midway, Liberty County, Ga. Liberty County was first settled by a colony from Dorchester, Mass., which, after a long residence at Summerville, S. C., removed to the seacoast of St. John's Parish, below Savannah, some time before the war of the Revolution. They established there a famous academy and a Congregational church. At the breaking out of the Revolution the county distinguished itself by sending a local delegate, Mr. Lyman Hall, afterwards first governor of Georgia, to the Continental Congress in place of a Territorial delegate, and received its name, on the organization of the State, in honor of its patriotism. For many years it remained one of the foremost of the educational centers of the State and flourished under its religious organization. The close of the civil war found the county almost depopulated of its white people. In 1898 the report of the school authorities informs us that "the freedmen of this county, in mind, manners, and morals, are evidently superior to this race in general," a result attributed largely to their training in the district Sunday schools by their former masters and mistresses.

By 1880 the number of scholars in the Presbyterian schools had somewhat increased, and the expenditure was \$72,000. In 1881 it is noted that the negro population had largely increased since the war, the gain being 38 per cent; the white folk increasing only 34 per cent, while 22 per cent had been the average of colored increase during the last two decades of slavery. The colored population

of the South in 1881 was estimated at 6,577,151. The management urges the churches to labor with more fervor in the work, and points to the reports of other denominations as a stimulus to greater efforts. The school at Charleston, S. C., had organized a distinct department of industrial education, with an attendance of 100 pupils. There were 1,537 students in the 5 superior schools.

In 1883 the general assembly of the Presbyterian Church, North, authorized the incorporation of "The Presbyterian Board of Missions for Freedmen of the Presbyterian Church in the United States of America." The annual income of the board had risen to \$108,120.85. The number of schools had increased to 65, with 6,995 pupils and 129 teachers; all the schools "strictly parochial." In 52 parochial schools there were 8,370 pupils, and 10,771 gathered in 158 Sabbath schools in 173 churches with a membership of 12,883. The board urges the fact that 76 per cent of the freedmen in the South are still illiterate, besides 1,000,000 voters, of whom 69 per cent could neither read their ballots nor write their names. In South Carolina, Louisiana, and Mississippi the colored population was far in excess of the white. In 1885 a freedman's department of the woman's executive committee of home missions was organized. In 1886 the work had been extended to the treaty tribes of the Indians.

Ten years later, 1896-97, we find the work of this church for the Southern freedmen but little advanced. A debt had been permitted to accumulate, and the reports speak of schools suspended or cut down in their appropriations. The number of superior schools had increased to 6, the fine buildings of one, the Barber Memorial, at Anniston, Ala., having recently been destroyed by fire. The day schools numbered 67, with 204 teachers and 9,442 pupils. The school term of 13 of the 17 leading schools had been reduced one month; 12 in session only six months each; the parochial schools, maintained at the expense of the board, in session only four months in the year. The office of the treasurer was consolidated with that of the field secretary. The general receipts declined to a lower figure in 1897 than in the previous eight years. During the twenty-seven years of the existence of the board \$1,000,287 had been expended. A theological school for negro students had been opened in Alabama.

It is not easy to understand why the powerful and wealthy Presbyterian Church of the Northern States has fallen so far behind the Congregational and Methodist bodies in the support of its schools for the freedmen. It will be remembered that at an early date this religious sect had formed the backbone of the educational work for the white people of the Southern States, and has always been distinguished for the cultivation, ability, and Christian zeal of its ministry. Perhaps an explanation will be found in the fact that in this church the central purpose of training teachers for the common schools of the colored people of the South has been almost ignored, there being only five schools of this sort, none of them of the first class in numbers and importance, engaged in this work. Their day schools have been "strictly parochial," and, of course, out of touch with the general work of the American common school. The financial depression of several years previous to 1897 told on all these missionary school agencies, and those that were exclusively ecclesiastical were the first to suffer.

#### THE PROTESTANT EPISCOPAL CHURCH IN THE EDUCATION OF THE COLORED RACE.

Prior to the establishment of the commission for the education of the colored race in the Protestant Episcopal Church the records of church work among this people in the different dioceses were not kept separately. In 1866 the sum of \$24,728 was expended in this work; in 1867, \$28,309; but in 1879 the support had fallen to \$8,519. In 1886 the sum total rose to \$18,423. In that year the commission for the colored race was established at the general convention of the church

in Chicago. At first it consisted of a board of 15 managers—5 bishops, 5 presbyters, and 5 laymen—the entire work in each diocese in charge of the bishop. In 1892 the membership of the commission was increased to 21—7 from each order—and all bishops were entitled to attend its meetings. In 1895 the number was again reduced to 15. The chairman of the commission is Right Rev. F. W. Dudley, D. D., bishop of the diocese of Kentucky, whose zeal and wisdom, as shown in his contributions to the literature of this work among the colored folk, are well established.

The work of the commission is entirely under ecclesiastical control. It declares that "our chief need in dealing with the education of the negro race is to provide educated and consecrated ministers fully alive to the conditions and wants of their bretheren, and anxious to labor with earnestness and devotion to dispel their prevailing ignorance and lift them to a higher plane of Christian intelligence and life." For this reason the work of the Christian commission is to so great an extent mingled with the general work of the church that it can not fairly be treated as separated therefrom. Of the five chief institutions that have been established since 1865, viz, in Raleigh, N. C.; Nashville, Tenn.; Washington, D. C.; Lawrenceville and Petersburg, Va., only two—St. Augustine, Raleigh, and St. Paul, Lawrenceville—cover the usual type of normal and industrial schools. These are evidently of the better class of their kind, containing in 1900 some 500 pupils and 23 teachers. The three theological schools have 32 students in preparation for the ministry.

During the twenty years from 1866 to 1886 the Protestant Episcopal Church expended \$351,514 in the entire church and school work among the negroes, and in the ten years from 1886 to 1896 the larger sum of \$441,494, the total for thirty years being \$793,008. The sum expended in 1895-96 was \$56,880, and in 1896-97 \$57,920. In the latter year the salary and office of general agent were abolished.

The schools supported by the commission are all, with the exception of the five before named, of the parochial type of this church. In the fifteen old slave States and District of Columbia, with a negro population of 8,000,000, these schools had in 1896 an average attendance of 4,346. There were 61 colored churches in the Southern dioceses and more than 60 white clergymen in the South actually interested in the colored work.

While the work among the vast colored population of the South by this church is perhaps more limited than that of the other leading Protestant churches, and only indirectly can it be said to affect the common school interest of the different States, it has yet, in one respect, a decided advantage above that of some of the churches that are doing more and are in nearer touch with the great central feature of popular education. The Protestant Episcopal Church, although divided during the period of the civil war, made haste on the advent of peace to close up its ranks and has wrought with great zeal and remarkable success as a united combination in every part of the Union. It concentrates its energies, to the great advantage of all the Southern churches of the body, in the work already described. Its bishops in all the fifteen former slave States and the District of Columbia are, in fact, the supervisors of the work of their own dioceses, and four of the five bishops, four of the five presbyters, and four of the five laity who compose the general commission are from the Southern States. The later organism, by which all the bishops are included as a sort of advisory committee in this commission, testifies to a growing interest in this important mission. The Spirit of Missions has given a large portion of its space to the subject, and the discussions of the foremost clergy and laity are every year more decided in regard to an increasing zeal in the cause of the colored people. The two normal and industrial and probably an increasing number of the parochial schools are every year more and more conforming to the

type of normal and industrial tuition represented by Hampton, Tuskegee, and the State institutions already described. In all ways it would seem that this church is in some respects more fully prepared than all others, save the Catholic and Congregational bodies, to concentrate its mind and treasure upon this point of missionary work as the years go on.

THE SOCIETY OF FRIENDS IN THE EDUCATION OF THE COLORED PEOPLE OF THE SOUTH.

The record of the relation of the religious denomination of the Friends, or Quakers, to the institution of slavery is one of the most suggestive chapters of the educational history of the British Empire and its colonies in America. From the days of George Fox, the founder of the sect, its protest against negro slavery at home and in the colonies became stronger with every year. There were exceptions to the general sentiment of the body, and Friends at different periods became slaveholders; but as far as possible under the conditions, especially in view of the severe laws against the emancipation of slaves in Virginia and North Carolina, the two States of the South in which the greater number of the Friends lived, the protest may be said to have fairly represented the public sentiment of the body. Under discouraging circumstances, in many ways in the North and South they kept alive the agitation which, begun in a state of peace, finally kindled the flames of a civil war which ended in the complete emancipation of the enslaved race.

It is asserted that the first important demonstration in the United States to bring before the public the duty and policy of immediate and unconditional emancipation was by Charles Lundy, who was born in North Carolina in 1775 and died in 1850. He removed to Tennessee in 1806. In 1814 he assisted in the organization of a numerous antislavery society and spent several years in this work. In 1817 he removed to Ohio and published the *Philanthropist*. He gave up the use of all slave-grown produce and in 1842-43 worked with the antislavery forces in Indiana. His effort in the advocacy of unconditional and immediate emancipation preceded that of William Lloyd Garrison in the North. In 1821 Lundy removed from Ohio to Tennessee and for three years published the *Genius of Universal Emancipation*, the paper afterwards being removed to Baltimore.

The result of these efforts was to strengthen the hands of the majority of the sect of the Friends who in Virginia and Maryland and through the South had steadily labored against the "peculiar institution." Besides emancipating their own slaves they had persuaded others to "go and do likewise," and several thousand negroes were sent through their aid to the North, although some of the Western States framed laws forbidding their reception.

But the most decisive result of this opposition to slavery was seen in the emigration of large numbers of the Friends from all the States of the South Atlantic to the new land of freedom in the Northwest. Begun in 1769 in Virginia, the movement was accelerated by the opening of the West, through the settlement at Marietta, Ohio, in 1788. As the years went on and the protests of the yearly meetings of the sect became of less effect, and even numbers of their people were still found among the slaveholders, the scattering departure of Friends changed to their migration by groups and in some cases of the entire membership of a yearly meeting. The tables compiled by Dr. S. B. Weeks, formerly of the U. S. Bureau of Education, in his exhaustive treatise on *The Southern Quakers and Slavery*, give the names of 2,178 persons, representing 1,000 families, who were recorded by the yearly meetings as "going West" from 1801 to 1860.

The majority of these people found their new home in Ohio and Indiana, and several of the most substantial counties in these States bear witness to the excel-

lent quality of this population, Wayne County, Ind., with Richmond as its county town, being a representative region of this description. Indeed, it is estimated that in 1850 one-third of its population was composed of white Carolinians and their children of the first generation. Although not all or probably the majority of Quaker ancestry, yet this denomination of Christians so largely represents the wealth, worth, and intelligence of many of these counties that their presence was not only a powerful influence against the growing power of slavery in the Union, but an encouragement of the immigration of large numbers of the nonslaveholding poorer class of Southern whites, for whom life in their native States had little of hope for themselves or their children. No class of immigrants to the West during the progress of the years has given a better account of itself in the development of distinguished characters than the southern Friends. Besides numerous eminent persons in public and professional life, many a prosperous community of the old East beyond the great central mountains has been indebted to them for leadership.

From an early period the question of the education of their children came to the front with increasing interest. In 1833 the celebrated Friends' Boarding School in Guilford County, N. C., was chartered. It was coeducational and received only the children of Friends, but its superiority broke down this limit and in 1863 70 per cent of the pupils were from families who sent their children on account of the merits of the institution. It opened in 1837 with 25 boys and 25 girls. In 1850 there were 94 and in 1858, 139, of whom only 60 were Quakers. In 1860 it found itself burdened with a debt of \$29,000, which the yearly meeting was unable to provide for. During the civil war it was conducted as a private school and came out intact in 1865. The influence of such an institution in a county so small could not be otherwise than great. In 1851 there were 85½ Quaker churches in North Carolina and 1,038 young people were taught in 120 schools, all coeducational. Of 1,853 children only 8 over the age of 5 were out of school. In 1855, of 1,060 children between 5 and 21, none over 5 were growing up in ignorance.

At the close of the civil war the migration of the Friends broke forth with new energy. Between 1866 and 1872 10,000 people left North Carolina alone, among whom were many Quakers. An effort was made, responding to a request from high quarters, to prevent this wholesale departure of a people so reliable. The Baltimore Association of Friends, to assist and advise Friends in the Southern States, was organized in 1865. Large supplies of provisions were sent and some of the people were persuaded to return and others to remain in the old home. The president of the association made 35 journeys to North Carolina and labored with great zeal in prosecuting this work. The denominational schools were rehabilitated and in 1866 reported 160 students. A normal school for training teachers, the first in the State, was kept up for several months and the teachers thus instructed were in great demand. In 1866 \$22,534.51 was expended. In 1865 the Friends in North Carolina had been left destitute of schools. A superintendent was sent from Indiana, who labored for three years, followed by a second from that State for eight years. In 1866 30 schools had been reestablished, which received aid from the Baltimore association. In 1868 the number had increased to 40, with 2,588 pupils; 1,430 being children of Friends—the schools in session six and one-half months in the year. In 1871 the number remained the same. In central North Carolina the movement was hailed as "one of the most favorable evidences of reconstruction." In 1867 a normal school for the training of Sunday-school teachers was organized.

This movement eventually extended to the schools for the freedmen. In 1867 the committee of management reported 6 day and 22 Sunday schools, with 1,600 to

2,000 colored children in attendance. In 1869 24 day and 35 Sunday schools contained 1,707 pupils. Dr. J. M. Tomlinson, brother of one of the most successful of the group of able superintendents of the new graded schools of North Carolina, was appointed superintendent of these colored schools in 1869. In 1871 there were 800 pupils in 16 schools, educated at an outlay of \$1,308.61. After this the movement for the colored schools seems to have declined. The excellent character of the Quaker schools, always the most pronounced of all the Protestant sects in respect to parochial education, doubtless told against the rapid development of the common school for the negroes. Indeed, for a long time in all the Southern States the movement for popular education for white as for colored children was confined to the country and village district school, leaving the more ambitious of the colored students to find their opportunity for the secondary and higher schooling in the different institutions established largely and supported by the Northern churches, the majority of which, if they did not assume the name "college" or "university," contained a class in high-school and college studies. A positive addition to the facilities for the advancement of the negroes was a model farm, provided in 1867 in Guilford County, named after Swarthmore College, Pennsylvania. A great interest in improved agriculture was awakened thereby, and it was declared that the influence of this movement extended so widely that 15,000 acres of land had been put into cultivation from this experiment.

In 1872 the schools were placed under the general charge of the "Yearly Meeting." There were 32 schools, with 62 teachers and 2,358 pupils, and not a child of Quaker parentage in North Carolina or Tennessee had been overlooked. In 1880 it was said that probably no child of this sect between the ages of 7 and 21 in North Carolina was unable to read and write. The moneys sent to North Carolina during the eleven years of this movement exceeded \$138,300, \$130,000 of which was for schools. Guilford College, to which many of these schools were tributary, received the gift of a new normal building.

The Pennsylvania Friends engaged in the work for the freedmen in 1869 reported 29 day schools, 40 teachers, and 2,000 pupils schooled at an expense of \$6,000. The Friends of New York by 1874 had invested \$18,000 in schools for white and colored pupils, and established a seminary of the higher education later in North Carolina. The New England Yearly Meeting has a college for colored girls at Maryville, Tenn., and the Indiana Yearly Meeting one in another location. The first class of Guilford College was graduated in 1889. At present it ranks as one of the most prosperous in the State. In 1895 the Friends of North Carolina report 6 academies, taught eight months in the year, with an attendance of 530, at the cost of \$1,776.25, with 14 schools, all preparatory for Guilford College. At the last report there were some 6,000 in the schools in North Carolina alone. In Tennessee, Florida, Arkansas, Louisiana, and Texas there are also the traces of the persistent educational work of this body. In respect to all classes of her people North Carolina has been a great center of educational life, as from her have gone forth some of the most important leaders of education in several of the Western and Southwestern States.

Since the dissolution of the Baltimore association there seems to have been no general working arrangement of this sect for the support of their schools, although the effort has not closed, and probably funds to some extent have been collected. The Pennsylvania Friends still contribute to two of the best seminaries of the secondary, higher, and industrial training among the negroes. The work of Miss Martha Schofield in her normal and industrial school at Aiken, S. C., is well known. This is one of the most successful of all institutions of the sort in the South. At one time it was accepted by the public school authorities of the city, a noted place of winter resort, for the schooling of all the children of the colored race. This school was established in 1868 under the auspices of the Friends, and

for twelve years it remained a day school. In 1882 it was rebuilt and reorganized, and has now a large attendance. Its classes in printing and other departments of industrial training are recognized as of the most encouraging character. A flourishing school at Charleston, S. C., is also dependent on the Pennsylvania Friends for aid.

The reports of the Swarthmore Corporation of Friends at Swarthmore College in 1896 reveal a growing movement away from the exclusive devotion to the parochial school among the more educated Friends, among whom is Dr. De Gamo, at that time president of the college, but later a professor in Cornell University. It was urged that the directors should more fully incline themselves to favoring the common schools, thus giving to the college access to a more extended constituency outside the sect. The increasing demand of the great body of the well-to-do Friends for superior schools will doubtless more and more bring the leading educators among the Quakers into harmony with the great central arrangement of the American people for universal education.

#### THE BAPTIST CHURCH OF THE NORTHERN STATES IN THE EDUCATION OF THE COLORED RACE IN THE SOUTH.

The Baptist Church of the Northern States was one of the earliest to enter the field in respect to the education of the freedmen. The Home Mission Society, established in 1832, originally had in view "the preaching of the Gospel in destitute regions, more especially in the West." But at the call of the exigency in 1861-1865 the society at once entered upon the "perplexing, difficult, hitherto untried experiment of providing for such a vast multitude a competent leadership, composed of men and women who had received some degree of training to fit them especially for the duties of teachers and preachers."

Naturally the work done in the schools founded by the mission societies for these people at first was crude, tentative, elementary, sometimes misleading and unsatisfactory; yet it proved on the whole to be of great value. Slowly, during the lapse of more than thirty years, these primitive schools have developed into institutions of learning modeled in large part after Christian schools of the North, but gradually adapting themselves in their ideas of instruction, discipline, and management to the peculiar necessities of the people for whom they were designed.

The changed conditions among the colored people, of which one of the influential causes has been the missionary work of the Northern churches, have been recognized by no board of management with more intelligence than by that of the Baptist Church. No church has given to the superintendency of its educational work a trio of more competent administrators than Morgan, McVicker, and Gregory, who since 1891 have been in constant touch with the schools for colored students and pupils. The reports of these gentlemen have discussed the real problems of negro education in the South with a fairness and consideration of the difficulties and hindrances attending it that have been a model for all missionary work in the same field. It was inevitable that the early missionaries, coming to this inviting and romantic work at the close of a revolutionary epoch, filled with patriotic ardor and religious zeal, but practically unacquainted with the history and social and industrial conditions of the South, many of them for the first time engaged either in educational or proper missionary work, should have rather attempted to impose a higher Anglo-Saxon civilization upon their credulous and childlike disciples than studied the nature, character, and actual history and possibilities of the first generation of a race that had never set its foot on the threshold of any schoolroom. We may commend the reports of these able and devoted men, published in the proceedings of the Baptist Home Mission Society

from 1893 to the present year, as among the most important documents amid the blinding cloud of literature in which the entire field of the education of the negro in the South has been enveloped.

In the report for 1896 attention is called to the unquestioned improvement made by the colored people during the past thirty years—"the dawn of a new day." The elements of this remarkable progress are noted as: (1) The establishment and support of a system of public schools for this race, including every grade of institution from the plantation primary to the industrial and normal college, supported by public taxation, as in all the public school States, at the expense of the general taxpaying class, 90 per cent of it being for the white population. It is believed by wise observers, all men of long experience and national reputation in common school affairs, that in due time this movement will "bring a common school education within the reach of all the colored youth of the country;" (2) the great service of the Peabody, Slater, and Hand funds in furnishing industrial and normal instruction for the colored people; (3) the missionary work of all the Northern churches, by which "many millions of dollars have been expended in the South in establishing distinctively Christian schools for the colored people;" (4) "the A. B. H. M. Society during this period of a generation has invested nearly \$3,000,000 in this great work, by which many thousands of colored youth have been taught and trained through periods of time varying from ten days to as many years."

On a careful inspection of the higher schools for the negroes of all the Christian missions in 1880-1884 by the author of this essay the most pressing need was found to be an adequate supervision of their educational work by experts thoroughly acquainted with common school affairs. The religious, social, and moral training in all these seminaries was conducted with great intelligence, good policy, and remarkable zeal and self-sacrifice in a way that greatly redounded to the credit of the workers in this department, and developed the marvelous genius for civilization that is the most hopeful characteristic of the negro race. But the management of the proper school work in the majority of these large seminaries was often little more than the transplanting of the college, academy, and district school methods of half a century ago by boards of denominational management not acquainted with the ideas and methods of "the new education" already in practice in the common schools of the principal educational centers of the country, sometimes prejudiced against any new departure from "the good old way." While these "old ways" were getting modified, especially in the Northern States, by the pressure of all the powerful agencies developed in a revolutionary epoch brought to bear on the school life of the new generation, many of them were almost pernicious when applied to a people like the freedmen. On the contrary, the vital spirit and methods of the new education were especially adapted to the schooling of a people whose only university up to a very recent past had been the life on a Southern plantation and the training of nature, with the undoubted powerful influence of the institution of American negro slavery as perhaps the most effective elevator from barbarism to the verge of civilization up to that time known in human history.

The movement for thorough superintendence of the school work in all these institutions, save a few which, like Hampton, had been piloted in the right way from the beginning, was appreciated and adopted with great effect by the Baptist management. The three superintendents above named, each in turn, brought to the work indomitable energy, clear intelligence, and a thorough comprehension of the existing condition of elementary education in the most progressive of the common-school States. Among the supervisors in this entire region of educational life, none has been more capable than Dr. McVicker, who, in 1890, was appointed general superintendent of schools by the Baptist Home Mission Society.

Dr. McVicker came to New York from an excellent training in the Dominion of Canada and, for several years, was president of the New York State Normal School at Canton, St. Lawrence County. In 1893 a most valuable contribution was made to the general board of management by the election of Gen. T. J. Morgan as general secretary and practically superintendent of the work. General Morgan, after a valuable military experience in the civil war, had already served as principal of State normal schools in New York and Rhode Island, followed by an administration of four years as the head of the Indian Department at Washington. At a later period, Dr. Gregory, who for many years had been known as one of the most distinguished educators in several of the Western States, was called to the office of superintendent of the Baptist educational work in the South.

The report of 1891, by Dr. McVicker, contains a list of 14 schools of the secondary and higher education, established by the Baptist Church movement in 12 States and in the District of Columbia, dating from the foundation of the Wayland Seminary in Washington, D. C., in 1865 to Spelman Seminary for girls in Atlanta, Ga., in 1888. There were also 15 academical schools in 13 States and the Indian Territory tributary to these. By the aid received from the John F. Slater fund 4 of these large schools had been able to introduce a course of industrial training and had made a decidedly forward step in their organization for training teachers. The vigorous superintendency of Dr. McVicker had already borne the fruit of an organization of schools aiming to facilitate the much-needed schooling of the masses of students and act as fitting schools to the institutions above them. The instruction of all the academical and industrial schools was carefully graded, especially for the aid of the colored people for whose benefit it was set up.

In discussing the vital question, to what extent the society should contribute to the prosecution of this work and what modification of its policy should be made, Superintendent McVicker rises above the local sectional and sectarian views which too often have embarrassed the operations of the Northern workers and reacted against the educational operations of the teacher. The great benefaction to education in the Spelman Seminary, Atlanta, Ga., by Mr. John D. Rockefeller had provided a gift that enabled this school to largely extend its work of secondary instruction. Still the friends of the cause understood the plain fact that a crisis had come in the educational affairs of the colored race in the South. After a prolonged inspection of all the schools established or aided by the society, Superintendent McVicker urged the establishment of secondary schools managed and largely supported by the colored people themselves and easily accessible for the more ambitious youth of the masses of the people, as a most effective agency in the impending crisis. He urges the all-important point that the next vital condition of the development of the negro race is a manhood and a womanhood Christianized by self-development, self-sacrifice, self-control, honesty, steadiness of purpose, and thrift. These are qualities which are not the production of mere knowledge nor of mere school instruction, however essential they may be considered. They are acquired rather through well-directed and persistent self-effort. It is self-evident that the colored people have now reached that stage of advancement that fits them properly for the exercise of a much higher degree of self-effort in educational matters than in the past.

The general conclusions of the superintendent are that "While remarkable progress has been made by a certain portion of the colored people during the past twenty-five years in everything that pertains to mental, intellectual, and moral advancement, it has been confined to a comparatively small number of the 6,741,951 colored population of the United States. The masses of these are still in a deplorable condition." Six present causes are named that explain this fact: (1) "Unfavorable and exacting conditions;" (2) "Indolent and improvident

habits;" (3) "The one-room cabin;" (4) "The unkind and in many cases cruel and criminal treatment given to the women and children by the men;" (5) "The comparatively low degree of the social and parental relation and the presence among the people of many ignorant and in some cases unprincipled leaders, ministers and others, who for purely selfish motives dominate over them." (6) "It is doubtful if sufficient emphasis is placed in the schools upon the phases of work that are most desirable and best fitted to render efficient help in elevating and instructing the masses of the negro race." He dwells with vigor upon a very notable fact—that while the students in these great schools are "the cream of the negro race," yet, too often, after all the expenditure of money, zeal, and self-sacrifice in their behalf, "their education fails to produce the self-sacrificing missionary spirit in any considerable number of them."

The pupils in the schools are younger than at first and more inclined to prefer technical scholarship to the neglect of the character and of the disposition to engage in hard work and render self-sacrificing and effective service in helping to better the condition of the suffering and oppressed. His idea of missionary work corresponds to that so aptly described by Gen. S. C. Armstrong, as pushed to the very degree of failure among the natives of the Sandwich Islands. While urging a broader training and development in the industrial arts and especially the quality of self effort, he still inclines to the fact that even this does not send forth young people with the spirit of missionary work for the vast body of the race. This is the most difficult and important work to be done with those who are coming forward as leaders of this people.

The superintendent also speaks a much-needed warning concerning the inadequacy of the teaching force. With all praise for the personal character and full appreciation of the work of the teachers in this great service, and full acknowledgment of the advancement, moral, social, and educational, due to this influence, he asserts that the time has come when the claims of students, their aspirations and needs, and the higher range of their life work demand a superior order of teaching. The investigations of the past year have brought out the fact that it is no longer possible to secure this higher grade of instruction by relying on the spirit of self-sacrifice and missionary zeal in the workers. The superior teachers, he says, in all these schools are now working for half the salaries they might command elsewhere, indeed many of them can hardly "make ends meet" through the long Southern summer vacation if compelled to return home for rest and recuperation. In one leading seminary in eleven years the teachers had given to the school in gratuitous service, often through the expense of long sickness contracted in the work, the large sum of \$70,729, an amount nearly equal to all that has been contributed to this school by the whole of New England. The plant of these schools should be again enlarged and especially the great work of training teachers and women missionaries should be extended. The total receipts for schools during the year 1893 were \$57,627.48.

The report for 1894 opens with an inspiring summons to the negro race: "Called as the negro is to compete with the white race in every department of activity, he must be prepared to compete on equal terms. He must not be handicapped by any inferiority of preparation. He must neither ask nor receive any favor on the ground of race and color, but in the stern conflict of life he must give and take on the basis of equal manhood." The place of Dr. Tupper in Shaw University, Raleigh, N. C., one of the most successful of the early founders of colored schools, had been taken by Prof. Charles F. Meserve, superintendent of one of the largest United States Government schools for the education of the Indians, a positive addition to the upper strata of male educators in the South. The expenditure for the year amounted to \$95,155 for salaries of teachers, the Home Mission Society contributing \$75,315 and the Woman's Baptist Home Mission Society \$19,840. In

addition there had been expended for buildings and other purposes, chiefly for the enlargement of schools, \$77,824, making a total of \$172,979 in a year of marked financial depression. The total attendance was 5,033, of whom 1,830 were preparing to teach. An important feature of the professional department was the nurse-training course at the Spelman Seminary for girls, in Atlanta, Ga. "A large proportion of the whole number have received systematic training in some line of industrial work." The society paid, in whole or in part, the salaries of 172 teachers, of whom 100 were women, 124 in the schools for colored youth. Fifteen of these schools were under the entire control of a board of colored trustees, three of the higher and twelve of the secondary, although subject to visitation by the superintendent of education. Thirty-nine of their 89 teachers were entirely supported by their own people, who, in 1894, contributed \$13,202 in this way.

The Baptist Board of Missions seems to have favored the inevitable tendency toward the instruction and management of colored schools by their own people earlier than the other Northern missionary boards. The public schools for children and youth, with the exception of a few in cities, are under the direct care of teachers of their own race, although in the majority of cases directly responsible to a school board of which the majority—sometimes all the members—are white, besides the general superintendency of the school system of the place. In the City of Washington, D. C., where the schools for the negroes are most completely developed, the general board, containing two colored members, governs the entire system, while a colored assistant superintendent has immediate charge of the colored schools. For many years this office was filled with great success by a member of the Cook family, noted for its early and continuous connection with the schools of the free negro people of the District. In the State colleges for the higher and industrial training of the race the same policy is pursued, the teachers being all colored, while the State superintendents and boards of education have complete control of the outside administration. In the States of Virginia and Alabama the famous institutions of Hampton and Tuskegee are subsidized to a limited extent by the State, while their general affairs are in charge of boards of trustees representing both sections of the country and both races.

The American Missionary Association, Freedmen's Aid Society, and Committee of Missions for Freedmen, of the Congregational, Methodist, and Presbyterian churches, respectively, the most conspicuous rivals of the Baptist Home Mission Society in this work, have pursued a more conservative policy in this respect, their teachers being almost entirely Northern white persons. The Hampton Institute has always relied on graduates from the most celebrated institutions for Northern white students for its teaching corps, with a very small mixture of colored instructors. Mr. Booker T. Washington, afterwards the celebrated president of the Tuskegee, Ala., Normal and Industrial Institute, was called to that work from a responsible position as the head of the Indian department at Hampton.

It was easy to foresee that here was a problem that would tax the wisdom of all these organizations from the North. It can hardly be supposed that these great religious bodies will go on forever at the present rate, paying out a million or more dollars a year for the support of a system of schools which is constantly growing upon their hands and capable of indefinite expansion. As to the very large investment in the buildings and furnishings of these schools, which are among the best in that section of the country, there comes a question of delivering up a property so valuable even to the white, much more to the colored people, to the South. Already in the Baptist, and to a less extent in all these schools, the question of promoting colored teachers to responsible positions has been considered and has threatened disturbing dissensions. Superintendent McVicker, while urging the necessity of making the colored people more self-dependent and competent for administration in education, throws in an early note of warning in his report of 1894. He says of certain institutions:

The management of these schools is not in many cases what it should be. The men charged with it are not always wisely selected. They are inexperienced and have only a very imperfect knowledge of what constitutes a good school and of the functions and duty of trustees. They are easily biased by persuasion of friends and neighborhoods in the selection of teachers and disposed to interfere unwisely in the management of the schools.

Such warnings from an educator so competent and experienced in school work were timely, not only for the mission, but in the administration of the public schools in the South for this race. A great deal of the inefficiency complained of in the common schools for colored youth in all the Southern States is due to a mistaken policy by public boards of education in giving their administration entirely into the hands of the colored members. While it would seem that this policy was dictated, as it doubtless often is, by a desire to treat the colored population fairly, yet the practical result is the same—almost inevitably plunging the entire administration of the colored school department into the vortex of petty jealousies and exasperating contentions that so largely interfere with the proper influence of their churches. It would seem to be the duty of such boards, while giving the colored race a fair representation through their wisest and best men and women, to insist that the schools shall not fall under the control of a group of contentious preachers or politicians, but that the children and youth should be defended, often against the inexperience and even more destructive defects that still characterize the administrative work of this people.

Attention was also called to the fact that in all these schools it should be impressed on the pupils that every year there should be sent forth an increasing number of young people who in some useful way could be missionaries of a true American civilization to their own families and neighborhoods, which often at great sacrifices and with greater expectations had given to their young what were to them extraordinary opportunities for superior training and culture. It was also shown that the 5,000 students in all these schools, one-half of whom were in the professional classes, were being instructed at a sum many hundred dollars less than the one city of Baltimore paid its teachers in either one of its high or large grammar schools.

The superintendent answers the question of the Eastern contributors whether the chief responsibility of superintendency and management in these schools should be placed upon the colored public teacher, by a decided "No." With all the encouraging signs in the material and other development of this people he declares that this policy would surely result in a rapid retrograde movement and lead to the ultimate ruin of the schools. The weak point of the colored people, even in the better educated class, is the lack of executive capacity and the danger from perpetual jealousy and contention fatal to the success of educational affairs. He returns to his former topic concerning the conditions of the masses of the freedmen after thirty years of liberty and a quarter of a century of American citizenship. It would seem that no argument was required on this point to any fair-minded educator after a careful observation of the entire field. It was always necessary to meet the persistent demand of a growing party among the colored people that this great amount of school property and appliances should be committed altogether to themselves. But here is the problem which, before another thirty years have passed, will tax the seamanship of these great educational bodies to keep this splendid fleet of educational craft afloat in the open sea. The State industrial and normal colleges will avoid this peril, from the fact that the entire public school system is under the superintendence of State and local boards which will be largely composed of white persons in all these States of the South.

But all these matters of administration fall into comparative insignificance before the previous question of the colored support of this sphere of education by

the Baptist Church. This church had ten years ago a colored membership of 1,400,000, more than one-third of the entire number of the denomination in the United States. In the fifteen years of the service of Dr. McVicker as corresponding secretary the schools had increased from 8 to 34, from 38 teachers to 200, from an attendance of 1,191 to 5,000 or 6,000 pupils. Thirty-five substantial buildings had been reared and a school property of \$1,000,000 placed on the ground. The schools had greatly improved in quality and the cost of their maintenance had accordingly increased. At least 7 of the larger schools put in an immediate demand for a stronger corps of instruction. In five years \$150,000 would be needed for the annual expenditure. The powerful competition of the schools of other churches would leave the schools of this sect in the background when left to the test of respective merits. The Home Mission Society has already found it impossible to meet this demand except by the sacrifice of important missionary and educational enterprises.

The society is steadily falling behind in pecuniary affairs. A reduction of 40 or 50 per cent in missionary appropriations should be made, if the schools in the South are kept up. It is safe only to appropriate \$50,000 a year for this important work. A permanent fund of \$1,000,000 is imperatively needed, as the present expenditure requires the income of \$2,000,000 at 5 per cent interest. In view of these facts, Superintendent McVicker urges the impossibility of supporting schools of any save the superior class. The training of leaders should be the chief if not the only work of the schools of the society. The graduates should be not only prepared as teachers and ministers, but trained for leadership in every department of life, industrial, social, civil, private, and public. All theological work should be confined to the school at Richmond, Va. Only a limited number of schools should be allowed to do proper college work, seven at the most, and not more than two schools be permitted to give a full professional training for which a normal diploma should be granted. A careful system of examination and inspection should be inaugurated in all the schools and the quality as well as quantity of the teaching force should be strictly considered. A large portion of the report deals with a bad condition of affairs in one of the institutions in Texas, and the burning by incendiary fires of several of their school buildings in Arkansas, Texas, and South Carolina.

In 1895 the Baptist church had made a hopeful advance toward the improvement of the school work in the appointment of an advisory committee in connection with the schools for colored people in the South supported by the Home Mission Society. The committee was to be only advisory, with no general or educational authority, but to have access to all schools and invited to present the results of their investigation to the two Home Mission Boards and the acting authorities of the institutions. This was a favorable movement toward what must inevitably come, the practical union and cooperation for all general purposes of the great educational missionary bodies, especially of the Protestant evangelical churches in both sections of the Union. Indeed, the practical beginning of this outward advancement toward some union of the sort is to-day evident to all observers competent to hold in one view the past experience and the inevitable burden that will fall upon these denominations if they continue the purely sectarian policy of expansion that has already brought the richest and most zealous of them to the brink of a financial crisis.

The amount expended in 1895 for schools was \$117,480.50, with a total expenditure of \$134,554.83. There were 232 teachers, of whom 130 were colored, with 4,358 students. The report for 1897 shows a singular condition of affairs in the work of schooling the colored race in the South. The 29 schools were supported at an expense of \$108,869.75. A gratifying feature in the case was the fact that the colored people, represented by the 5,000 students, supplied for teachers \$20,137.32, and the board, \$64,079.57. This sum, increased by other gifts to \$22,591.31, made

a total of \$106,808.20. There seemed yet to be no response to the call for the general endowment, regarded essential to the continued existence of the higher schools, although the secondary seminaries were aided by special gifts.

Beside this large expenditure now during forty years in behalf of the colored children and youth in the South by the churches of every sect in the Northern States, there has been a large amount of money contributed and a great deal of good work done by personal and private effort. Indeed, one of the most philanthropic divisions of the religious public, including the Unitarian and Universalist denominations, and perhaps the larger bodies of the Christian connection may be added, with a great number of semireligious benevolent associations, has never followed the example of other sects in establishing schools, although in proportion to its numbers and means it is probable that as much has been contributed, especially to Hampton, Tuskegee, and a variety of smaller enterprises, as by the great organized educational and missionary boards. Numbers of faithful men and devoted women, some of the best in the land, have through all these years kept alive, in the more destitute districts of the Southern States, schools, missions, churches, along with an amount of private charity which has done much to supplement the public efforts of the communities to which their beneficence has been directed.

Here ends the account of the special movement which for the past forty years has wrought every year in a growing connection with the greater labors of the Southern people, directly and indirectly, in building their first general system of common schools. It was essential to the truth of history and to a fair estimation of the interest by the North and the nation in the civilization and education of millions of the new colored citizenship that this should be put in permanent record. All this has been done by these educational boards in a spirit as praiseworthy as has often been found in the similar work of the Christian church in any age or land; and every year it has been better appreciated by the superior class in the States which have been the great field of their operation. Indeed, the time has already passed when this remarkable movement in behalf of the colored people is regarded with disparagement by any considerable class of people anywhere. There will still be inevitable differences of opinion concerning the best methods of educating a people in a condition so peculiar. It may be that at times and in special places the school instruction has been too far above the capacity of the majority of pupils to be thoroughly or very largely incorporated into the character and living, especially of large numbers who were too young and remained too short a time in school to be permanently affected thereby. But in the great rivalry of the educational agencies now at work all methods have an opportunity of being tested, and a general drawing together of the superior educational workers in these schools will inevitably bring to the front the most valuable elements and forces developed by the entire movement. The churches have still a great work before them; first of all, "to settle up" all their differences which refer to the past, especially those connected with the period of sectarian contention and sectional hostility, through the twenty years from 1860 to 1880. There is certainly, ahead, in the opening century, a vast field of effort among the destitute places of our own population at home and in our new possessions around the world in which the united energies of the National Government, the churches, and the whole people may be brought to bear for the extirpation of the illiteracy of the millions who bear the name of American citizen or aspire to the possession of American citizenship. And when the people are lifted above the deplorable strife of partisan politics and sectarian ecclesiasticism it may be revealed to them that there is no grander work than the training of our twenty millions still involved in the great national slough of illiteracy toward the broad upland of that American citizenship which is the loftiest position yet offered to a whole people in the history of mankind.

## CHAPTER VI.

### LAWS RELATING TO TEMPERANCE INSTRUCTION.

A COMPILATION OF THE LAWS OF THE SEVERAL STATES AND TERRITORIES RELATING TO COMPULSORY INSTRUCTION IN THE PUBLIC SCHOOLS IN PHYSIOLOGY AND HYGIENE, WITH SPECIAL REFERENCE TO THE EFFECTS OF ALCOHOLIC DRINKS AND NARCOTICS UPON THE HUMAN SYSTEM.

---

#### ALABAMA.

[From General Public School Laws of Alabama, 1901.]

3546. *Duties of superintendent of education.*—The duties of superintendent of education shall be as follows: \* \* \*

3. He shall make provision for instructing all pupils in all schools and colleges supported, in whole or in part, by public money, or under State control, in hygiene and physiology, with special reference to the effects of alcoholic drinks, stimulants, and narcotics upon the human system. (Page 6.)

3578. *Instruction as to the nature of alcoholic drinks and narcotics.*—Every teacher shall give instruction as to the nature of alcoholic drinks and narcotics and their effects upon the human system, and such subject shall be taught as regularly as any other in the public schools, and in every grade thereof. (Page 20.)

#### ALASKA.

See District of Columbia.

#### ARIZONA.

[From Public School Laws of Arizona, 1901.]

AN ACT to revise and codify the laws of Arizona, approved March 15, 1901, title 17: Education.

SEC. 13. Every applicant for a first-grade Territorial certificate must be examined by written and oral questions in algebra, geography, history and civics, physiology, hygiene, with special reference to the nature and the effects of alcoholic drinks and other narcotics and stimulants upon the human system, \* \* \*. (Page 8.)

SEC. 85. Instruction must be given in the following branches, viz: Reading, writing, orthography, arithmetic, geography, grammar, history of the United States, elements of physiology, hygiene, including the nature of alcoholic drinks and narcotics and special instruction as to their effect upon the human system, \* \* \*. (Page 31.)

See also District of Columbia.

## ARKANSAS.

[From Digest of Laws Relating to Free Schools in the State of Arkansas, 1901 (pages 25-26).]

ACT LII.—AN ACT to require the teaching in the public schools of physiology and hygiene, with special reference to the effects of alcoholic drinks, stimulants, and narcotics upon the human system.

*Be it enacted by the general assembly of the State of Arkansas:*

SECTION 1. That physiology and hygiene, which must in each division of the subject thereof include special reference to the effect of alcoholic drinks, stimulants, and narcotics upon the human system, shall be included in the branches of study now and hereafter required to be regularly taught and studied by all the pupils in the common schools of this State.

SEC. 2. It shall be the duty of the boards of directors and county examiners to see to the observance of this statute and make provisions therefor; and it is especially enjoined upon the county examiner of each county that he include in his report to the State superintendent of public instruction the manner and extent to which the requirements of section 1 of this act are complied with in the schools and institutions of his county.

SEC. 3. After two years from the passage of this act no license shall be granted to any person to teach in the public schools of this State who has not passed a satisfactory examination in physiology and hygiene, with special reference to the effects of alcoholic drinks, stimulants, and narcotics upon the human system.

SEC. 4. That this act take effect and be in force from and after the first day of July, 1899.

Approved March 10, 1899.

## CALIFORNIA.

[From School Laws of California, 1901 (pages 40-41).]

SEC. 1665. Instruction must be given in the following branches in the several grades in which they may be required, viz: Reading, writing, orthography, arithmetic, geography, nature study; language and grammar, with special reference to composition; history of the United States and civil government; elements of physiology and hygiene, with special reference to the effect of alcohol and narcotics on the human system; music, drawing, and elementary bookkeeping, humane education: *Provided*, That instruction in elementary bookkeeping, humane education, elements of physiology and hygiene, music, drawing, and nature study may be oral, no text-books on these subjects being required to be purchased by the pupils: *Provided further*, That county boards of education may, in districts having less than one hundred census children, confine the pupils to the studies of reading, writing, orthography, arithmetic, language and grammar, geography, history of the United States and civil government, elements of physiology and hygiene, and elementary bookkeeping until they have a practical knowledge of these subjects: \* \* \*.

SEC. 1667. Instruction must be given in all grades of school and in all classes during the entire school course in manners and morals, and upon the nature of alcoholic drinks and narcotics and their effects upon the human system.

## COLORADO.

[From The School Law of the State of Colorado as amended to date, 1901.]

SEC. 78. The public schools of this State shall be taught in the English language, and the school boards shall provide to have taught in such schools the branches specified in section fifteen of said [this] chapter, and such other branches

of learning in other languages as they may deem expedient, including hygiene, with special reference to the effects of alcoholic stimulants and narcotics upon the human body; \* \* \*. (Page 63.)

*Alcoholic drinks and narcotics* (page 79).

AN ACT to provide for the study of the nature of alcoholic drinks and narcotics and their effects upon the human system in connection with the several divisions of the subject of physiology and hygiene by the pupils in the public schools of the State. Approved April 4, 1887. In force July 4, 1887. [L. '87, p. 378.]

NATURE AND EFFECTS OF ALCOHOLIC DRINKS AND NARCOTICS TO BE TAUGHT.

SECTION 1. That the nature of alcoholic drinks and narcotics and special instructions as to their effects upon the human system, in connection with the several divisions of the subject of physiology and hygiene, shall be included in the branches of study taught in the public schools of the State, and shall be studied and taught as thoroughly and in the same manner as other like required branches are in said schools, by the use of text-books designated by the board of directors of the respective school districts, in the hands of pupils where other branches are thus studied in said schools, and by all pupils in all said schools throughout the State. [L. '87, p. 378, sec. 1; Mills Ann. St., sec. 4046.]

FAILURE TO ENFORCE PROVISIONS OF ACT—PENALTY.

SEC. 2. That it shall be the duty of the proper officers in control of any school described in the foregoing section to enforce the provisions of this act; and any such officer, school director, committee, superintendent, or teacher who shall refuse, fail, or neglect to comply with the requirements of this act, or shall neglect, refuse, or fail or [to] make proper provisions for the instruction required, and in the manner specified by the first section of this act, for all pupils in each and every school under his or her jurisdiction, shall be removed from office, and the vacancy filled as in other cases. [L. '87, p. 379, sec. 2; Mills Ann. St., sec. 4047.]

CONNECTICUT.

[From Bulletin No. 11, 1901, public acts relating to education passed January session, 1901 (page 4).]

CHAPTER 81.—*The study of physiology and hygiene.*

(School laws, 1900, sections 41, 42, 79, 93.)

SECTION 1. The effects of alcohol and narcotics on health, and especially on character, shall be taught in connection with hygiene, as a regular branch of study, to all pupils above the third grade in all graded public schools except public high schools.

SEC. 2. Suitable text-books of physiology and hygiene, which explain the effects of alcohol and narcotics on the human system, shall be used in grades above the fifth in all graded public schools except public high schools.

SEC. 3. The provisions of sections one and two of this act shall apply, in ungraded public schools, to classes corresponding to the grades designated in said sections.

SEC. 4. All normal schools and teachers' training schools shall give instruction in the subjects prescribed in section one of this act and in the best methods of teaching such subjects.

SEC. 5. No certificate to teach in grades above the third shall be granted to any person who has not passed a satisfactory examination in the subjects prescribed in section one of this act.

SEC. 6. If it shall be satisfactorily proven to the comptroller that any town or district having pupils above the third grade has failed to meet the requirements

of this act, such failure shall be deemed sufficient cause for withholding, in whole or in part, school dividends which such town or district would otherwise be entitled to receive.

SEC. 7. Chapter clvii of the Public Acts of 1893 and sections 2100 and 2141 of the General Statutes are hereby repealed.

#### DELAWARE.

[From Delaware School Laws for Free Public Schools, 1898.]

SEC. 16. \* \* \* It shall be the further duty of each of said committees and boards of education to see that all the pupils in all the free schools in the district are instructed in physiology and hygiene, with special reference to the effects of alcoholic drinks, stimulants, and narcotics upon the human system, and to see that all the said schools are sufficiently supplied with such text-books relating to such subjects as are furnished the district in the distribution of free text-books hereinafter provided. Any teacher in any of the free schools of the State, failing to so instruct all the pupils under his governance, shall, unless ordered to the contrary by a school officer having authority over him, be liable to a fine of \$25, to be recovered before any justice of the peace of the proper county by any informer; and any school officer ordering a teacher under him not to instruct the pupils as aforesaid shall be liable to like fine, recoverable as aforesaid by any informer. (Page 24.)

SEC. 24. \* \* \* Every person who is of a good moral character, and who shall in examination answer 90 per centum of the questions asked in orthography, reading, writing, mental arithmetic, written arithmetic, geography, physiology and hygiene, with special reference to the effect of alcoholic stimulants and narcotics upon the human system, \* \* \* shall receive from the superintendent a first-grade certificate, \* \* \*. (Page 33.)

The requirements for second grade and provisional certificates likewise include the study of physiology and hygiene.—(Ed.)

#### DISTRICT OF COLUMBIA.

[U. S. Statutes, Forty-ninth Congress, first session.]

#### CCCLXII.

AN ACT to provide for the study of the nature of alcoholic drinks and narcotics, and of their effects upon the human system, in connection with the several divisions of the subject of physiology and hygiene, by the pupils in the public schools of the Territories and of the District of Columbia, and in the Military and Naval Academies, and Indian and colored schools in the Territories of the United States.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled:*

SECTION 1. That the nature of alcoholic drinks and narcotics, and special instruction as to their effects upon the human system, in connection with the several divisions of the subject of physiology and hygiene, shall be included in the branches of study taught in the common or public schools, and in the Military and Naval Schools, and shall be studied and taught as thoroughly, and in the same manner, as other like required branches are in said schools, by the use of text-books in the hands of pupils where other branches are thus studied in said schools and by all pupils in all said schools throughout the Territories, in the Military and Naval Academies of the United States, and in the District of Columbia, and in all Indian and colored schools in the Territories of the United States.

SEC. 2. That it shall be the duty of the proper officers in control of any school described in the foregoing section to enforce the provisions of this act; and any such officer, school director, committee, superintendent, or teacher, who shall refuse or neglect to comply with the requirements of this act or shall neglect or fail to make proper provisions for the instruction required, and in the manner

specified by the first section of this act, for all pupils in each and every school under his jurisdiction, shall be removed from office and the vacancy filled as in other cases.

SEC. 3. That no certificate shall be granted to any person to teach in the public schools of the District of Columbia or Territories after the first day of January, anno Domini 1888, who has not passed a satisfactory examination in physiology and hygiene, with special reference to the nature and the effects of alcoholic drinks and other narcotics upon the human system.

Approved, May 20, 1886.

#### FLORIDA.

[From Digest of the School Laws of the State of Florida, 1900. (Pages 16, 18.)]

SEC. 40. Each board of public instruction is directed— \* \* \*

14th. To prescribe, in consultation with prominent teachers, a course of study for the schools of the county and grade them properly, and to require to be taught in every public school in the country over which they preside elementary physiology, especially as it relates to the effects of alcoholic stimulants and narcotics, morally, mentally, and physically; and all persons applying for certificates to teach shall be examined upon this branch of study under the same conditions as other branches required by law. (Rev. Stat., sec. 242, 10th.)

#### GEORGIA.

#### *Physiology and hygiene to be taught in public schools.*

No. 367.

AN ACT to provide for the teaching of physiology and hygiene (physiology, which shall include with other hygiene the nature and effects of alcoholic drinks and other narcotics upon the human system) in the public schools in Georgia; to provide a penalty in case any board of education, in city or county, fails to provide for the teaching of the same, and requiring all teachers to stand a satisfactory examination upon said subject as for other subjects.

SECTION I. *Be it enacted by the general assembly of the State of Georgia, and be it hereby enacted by authority of the same,* That the nature of alcoholic drinks and narcotics, and special instruction as to their effects upon the human system, in connection with the several divisions of the subject of physiology and hygiene, shall be included in the branches of study taught in common or public schools in the State of Georgia, and shall be studied and taught as thoroughly and in the same manner as other like required branches are in said schools.

SEC. II. It shall be the duty of county and city superintendents of schools receiving aid from the State to report to the State school commissioner any failures or neglect on the part of the board of education; to make provisions for instructions of all pupils in any and all of the schools under their jurisdiction, in physiology and hygiene (physiology, which shall include with other hygiene the nature and effects of alcoholic drinks and other narcotics upon the human system); and the board of education of each county of this State shall adopt proper rules to carry the provisions of this law into effect.

SEC. III. No license shall be granted any person to teach in the public schools, receiving money from the State, after the first Monday in January, 1903, who has not passed a satisfactory examination in physiology and hygiene (physiology, which shall include with other hygiene the nature and effects of alcoholic drinks with other narcotics upon the human system).

SEC. IV. Be it further enacted that all laws in conflict with this act are hereby repealed.

Approved, December 17, 1901.

## HAWAII.

See District of Columbia.

## IDAHO.

[From General School Laws of the State of Idaho, 1901. (Page 29.)]

SEC. 1038. *Certificates, to whom granted.*—The county superintendent shall grant certificates in such form as the State superintendent shall prescribe to those persons only who shall have attained the age of eighteen years, who have attended the said public examination and shall be found to possess good and moral character, thorough scholarship, and ability to govern and instruct the school, but no certificate shall be granted to any person, except to applicants for primary certificates, who shall not pass a satisfactory examination in orthography, reading, writing, grammar, arithmetic, geography, history of the United States, civil government, physiology, and hygiene, with particular reference to the effects of alcoholic drinks, stimulants, and narcotics upon the human system, \* \* \*.

## ILLINOIS.

[From Illinois School Law, 1901. (Pages 91-92.)]

AN ACT to amend "An act relating to the study of physiology and hygiene in the public schools," approved June 1, 1889, in force July 1, 1889. Approved June 9, 1897, in force July 1, 1897.

SECTION 1. *Be it enacted by the people of the State of Illinois, represented in the general assembly,* That "An act relating to the study of physiology and hygiene in the public schools," approved June 1, 1889, in force July 1, 1889, be amended so as to read as follows:

That the nature of alcoholic drinks and other narcotics and their effects on the human system shall be taught in connection with the various divisions of physiology and hygiene as thoroughly as are other branches in all schools under State control, or supported wholly or in part by public money, and also in all schools connected with reformatory institutions.

All pupils in the above-mentioned schools below the second year of the high schools and above the third year of school work, computing from the beginning of the lowest primary year, or in corresponding classes of ungraded schools, shall be taught and shall study this subject every year from suitable text-books in the hands of all pupils, for not less than four lessons a week for ten or more weeks of each year, and must pass the same tests in this as in other studies.

In all schools above mentioned all pupils in the lowest three primary school years, or in corresponding classes in ungraded schools, shall each year be instructed in this subject orally for not less than three lessons a week for ten weeks in each year, by teachers using text-books adapted for such oral instruction as a guide and standard.

The local school authorities shall provide needed facilities and definite time and place for this branch in the regular course of study.

The text-books in the pupils' hands shall be graded to the capacities of the fourth year, intermediate, grammar, and high school pupils, or to corresponding classes as found in ungraded schools.

For students below high-school grade, such text-books shall give at least one-fifth their space, and for students of high-school grade shall give not less than twenty pages to the nature and effects of alcoholic drinks and other narcotics. The pages on this subject, in a separate chapter at the end of the book, shall not be counted in determining the minimum.

SEC. 2. In all normal schools, teachers' training classes, and teachers' institutes, adequate time and attention shall be given to instruction in the best methods of

teaching this branch, and no teacher shall be licensed who has not passed a satisfactory examination in this subject and the best methods of teaching it.

Any school officer or officers who shall neglect or fail to comply with the provisions of this act shall forfeit and pay for each offense the sum of not less than five dollars nor more than twenty-five dollars.

## INDIANA.

[From School Law of Indiana, 1901-2. (Pages 205-206.)]

(1895, p. 375. Approved March 14, 1895. In force June 28, 1895.)

228. *Effect of alcoholic drinks and narcotics.*—1. The nature of alcoholic drinks and narcotics and their effects on the human system in connection with the subjects of physiology and hygiene shall be included in the branches to be regularly taught in the common schools of the State and in all educational institutions supported wholly or in part by money received from the State, and it shall be the duty of the boards of education and boards of such educational institutions, the township trustees, the board of school trustees of the several cities and towns in this State, to make provisions for such instruction in the schools and institutions under their jurisdiction, and to adopt such methods as shall adapt the same to the capacity of the pupils in the various grades therein; but it shall be deemed a sufficient compliance with the requirements of this section if provision be made for such instruction orally only, and without the use of text-books by the pupils. (R. S., 1897, § 6201.)

229. *Teachers examined concerning.*—2. No certificate shall be granted to any person [on] or after the first day of July, 1895, to teach in the common school or in any educational institution supported as aforesaid who does not pass a satisfactory examination as to the nature of alcoholic drinks and narcotics and their effects upon the human system. (R. S., 1897, § 6118.)

230. *Failure to teach effects—dismissal.*—3. Any superintendent or principal of, or teacher in any common school or educational institution supported as aforesaid, who willfully refuses or neglects to give the instruction required by this act shall be dismissed from his or her employment. (R. S., 1897, § 6202.)

## INDIAN TERRITORY.

See District of Columbia.

## IOWA.

[From Iowa School Laws and Decisions, 1902.]

*The normal school.*

SEC. 2677. *Branches of study.*—Physiology and hygiene shall be included in the branches of study regularly taught to and studied by all pupils in the school, and special reference shall be made to the effect of alcoholic drinks, stimulants, and narcotics upon the human system; and the board of trustees shall provide the means for the enforcement of the provisions of this section, and see that they are obeyed. [25 G. A., ch. 1, §1.] (Page 117.)

*Examination of teachers.*

SEC. 2736. *Subject.*—The examination shall include competency in and ability to teach orthography, reading, writing, arithmetic, geography, grammar, history of the United States, didactics, and physiology and hygiene, which latter, in each

division of the subject, shall include special reference to effects of alcohol, stimulants, and narcotics upon the human system. \* \* \* (Pages 11-12.)

NOTE 4 (by superintendent of public instruction).—It is the intention of the law that the study of physiology and hygiene with special reference to the effects of alcoholic stimulants, narcotics, and poisonous substances, shall have at least equal rank with and be considered of as great importance as other branches of study. (Page 12.)

SEC. 2737. *Certificate—revocation.*—\* \* \* The superintendent shall revoke the certificate of any teacher who shall fail or neglect to comply with the provisions of law relating to the teaching of physiology and hygiene, and such teacher shall be disqualified for teaching in any public school for one year thereafter. (Pages 13, 14.)

SEC. 2739. *Reports.*—The county superintendent shall annually, on the first Tuesday in October, make a report to the superintendent of public instruction, giving a full abstract of the several reports made to him by the secretaries and treasurers of school boards, stating the manner in and extent to which the requirements of the law regarding instruction in physiology and hygiene are observed, and such other matters as he may be directed by the State superintendent to include therein, or he may think important in showing the actual condition of the schools in his county. \* \* \* (Page 16.)

SEC. 2740. *Enforcing laws.*—The county superintendent shall see that all provisions of the school law, so far as it relates to the schools or school officers within his county, are observed and enforced, specially those relating to the fencing of schoolhouse grounds with barb wire and the introduction and teaching of such divisions of physiology and hygiene as relate to the effects of alcohol, stimulants, and narcotics upon the human system, and to this end he may require the assistance of the county attorney, who shall at his request bring any action necessary to enforce the law or recover penalties incurred. [21 G. A., ch. 1, § 2; 20 G. A., ch. 103, § 2.] (Page 17.)

#### *Board of directors.*

SEC. 2775. *Instruction as to stimulants, narcotics, and poisons.*—It shall require all teachers to give and all scholars to receive instruction in physiology and hygiene, which study in every division of the subject shall include the effects upon the human system of alcoholic stimulants, narcotics, and poisonous substances. The instruction in this branch shall, of its kind, be as direct and specific as that given in other essential branches, and each scholar shall be required to complete the part of such study in his class or grade before being advanced to the next higher, and before being credited with having completed the study of the subject. [21 G. A., ch. 1.] (Pages 45-6.)

NOTES by superintendent of public instruction:

SEC. 2775. 1. This study must begin in the lowest primary class. In what grade or class it shall be completed is to be determined by the board.

2. Primary classes must be instructed orally, as the children are not old enough to use or comprehend a book. But this oral instruction must be outlined as a course and adopted by each board. (Page 45.)

#### KANSAS.

[From School Laws of Kansas, 1901 (page 75).]

SEC. 206. *Examination of teachers in physiology and hygiene.*—No certificate shall be granted to any person to teach in any of the public schools of this State after the 1st day of January, 1886, who has not passed a satisfactory examination in the elements of physiology and hygiene with special reference to the effects of alcohol stimulants and narcotics upon the human system; and provision shall be made by the proper officers, committees, and boards for instructing all

pupils in each public school supported by public money and under State control upon the aforesaid topics. (Laws, 1885, ch. 169, sec. 1; Gen. Stat., 1889, sec. 5667.)

## KENTUCKY.

[From Kentucky Common School Laws, 1900 (page 15).]

SEC. 21. *Course of study.*—The instruction prescribed by the board shall embrace spelling, reading, writing, arithmetic, English grammar, English composition, geography, physiology and hygiene, civil government, United States history, and the history of Kentucky. After July 1, 1893, the nature and effects of alcoholic drinks and narcotics upon the human system shall, in all schools supported wholly or in part by the State, be taught as thoroughly as other required studies to all pupils studying physiology and hygiene as a part of this branch.

## LOUISIANA.

[From State School Law approved July 10, 1902.]

SEC. 23. *Be it further enacted, etc.,* That the branches of orthography, reading, writing, drawing, arithmetic, geography, grammar, United States history, the laws of health, including the evil effects of alcohol and narcotics, shall be taught in every district. \* \* \* (Page 21.)

*Grades of certificates.*

SEC. 51. *Be it further enacted, etc.,* That to obtain a third-grade certificate the applicant must be found competent to teach spelling, reading, penmanship, drawing, arithmetic, English grammar, geography, the history of the United States, the Constitution of the United States, the constitution of the State of Louisiana, physiology, and hygiene with special reference to the effects of stimulants and narcotics upon the human system, and the theory and art of teaching. (Page 29.)

## MAINE.

[From Maine School Laws, 1901.]

*Powers and duties of superintending school committees and superintendents.*

SEC. 87. II. On satisfactory evidence that a candidate possesses a good moral character and a temper and disposition suitable to be an instructor of youth, they shall examine him in reading, spelling, English grammar, geography, history, arithmetic, bookkeeping, civics, and physiology with special reference to the effects of alcoholic drinks, stimulants, and narcotics upon the human system; \* \* \*. (Pages 22-3.)

III. \* \* \* No certificate shall be granted any person to teach in the public schools of this State after the fourth day of July, eighteen hundred and eighty-five, who has not passed a satisfactory examination in physiology and hygiene with special reference to the effects of alcoholic drinks, stimulants, and narcotics upon the human system. (Page 23.)

V. They shall make provisions for instructing all pupils in all schools supported by public money, or under State control, in physiology and hygiene with special reference to the effects of alcoholic drinks, stimulants, and narcotics upon the human system. (Pages 23-4.)

## MARYLAND.

[From the School Laws of Maryland, to January session, 1902 (page 19). 1886, ch. 435.]

40. The nature of alcoholic drinks and narcotics, with special instruction as to their effects upon the human system, in connection with the several divisions

of the subject of physiology and hygiene, shall be included in the branches of study taught in the common schools, and shall be taught to and studied by all pupils whose capacity will admit of it, in all departments of the public schools of the State, and in all educational institutions supported wholly or in part by money from the State; and the said study shall be taught to and studied by said pupils in said schools as thoroughly and in the same manner as other like branches are there taught and studied, with text-books in the hands of pupils, where other like branches are thus studied; and said text-books must be published, printed, and sold in the State of Maryland.

41. It shall be the duty of boards of county school commissioners and of the board of commissioners of public schools of Baltimore city, county examiners, superintendents of public schools of Baltimore city, and boards of all educational institutions receiving aid from the State, to enforce the provisions of the preceding section.

#### MASSACHUSETTS.

[From the Revised Laws of the Commonwealth of Massachusetts relating to Public Instruction, 1902.]

#### *Public schools.*

SECTION 1. Every city and town shall maintain, for at least thirty-two weeks in each year, a sufficient number of schools for the instruction of all the children who may legally attend a public school therein, except that in towns whose assessed valuation is less than two hundred thousand dollars, the required period may, with the consent of the board of education, be reduced to twenty-eight weeks. Such schools shall be taught by teachers of competent ability and good morals, and shall give instruction in orthography, reading, writing, the English language and grammar, geography, arithmetic, drawing, the history of the United States, physiology and hygiene, and good behavior. In each of the subjects of physiology and hygiene special instruction as to the effects of alcoholic drinks and of stimulants and narcotics on the human system shall be taught as a regular branch of study to all pupils in all schools which are supported wholly or partly by public money, except schools which are maintained solely for instruction in particular branches. \* \* \* [Revised Laws, chapter 42.] (Page 11.)

#### *School attendance.<sup>a</sup>*

SECTION 1. Every child between seven and fourteen years of age shall attend some public day school in the city or town in which he resides during the entire time the public day schools are in session. \* \* \* The attendance of a child upon a public day school shall not be required if he has attended for a like period of time a private day school approved by the school committee of such city or town in accordance with the provisions of the following section, or if he has been otherwise instructed for a like period of time in the branches of learning required by law to be taught in the public schools, or if he has already acquired such branches of learning. \* \* \* (Pages 25-6.)

SEC. 2. For the purposes of the preceding section, school committees shall approve a private school only when the instruction in all the studies required by law is in the English language, and when they are satisfied that such instruction equals in thoroughness and efficiency and in the progress made therein the instruction in the public schools in the same city or town; \* \* \*. [R. L., ch. 44.] (Page 26.)

<sup>a</sup>The requirements of the school attendance law virtually compel the private schools of the State to adopt instruction in scientific temperance. Otherwise attendance upon them will not be accepted as an equivalent for the compulsory period required in the law.

## MICHIGAN.

[From the General School Laws of Michigan, 1901.]

(58.) § 4680. SEC. 15. The district board shall specify the studies to be pursued in the schools of the district [districts], and in addition to the branches in which instruction is now required by law to be given in the public schools of the State, instruction shall be given in physiology and hygiene, with a special reference to the nature of alcohol and narcotics and their effects upon the human system. Such instruction shall be given by the aid of text-books in the case of pupils who are able to read, and as thoroughly as in other studies pursued in the same school. The text-books to be used for such instruction shall give at least one-fourth of their space to the consideration of the nature and effects of alcoholic drinks and narcotics, and the books used in the highest grade of graded schools shall contain at least twenty pages of matter relating to this subject. Text-books used in giving the foregoing instructions shall first be approved by the State board of education. Each school board making a selection of text-books under the provisions of this act shall make a record thereof in their proceedings, and text-books once adopted under the provisions of this act shall not be changed within five years, except by the consent of a majority of the qualified voters of the district present at an annual meeting, or at a special meeting called for that purpose. The district board shall require each teacher in the public schools of such district before placing the school register in the hands of the directors [director], as provided in section thirteen of this act, to certify therein whether or not instruction has been given in the school or grade presided over by such teacher, as required by this act, and it shall be the duty of the director of the district to file with the township clerk a certified copy of such certificate. Any school board neglecting or refusing to comply with any of the provisions of this act shall be subject to fine or forfeiture the same as for neglect of any other duty pertaining to their office. This act shall apply to all schools in the State, including schools in cities or villages, whether incorporated under special charter or under the general laws. [Act 165, 1887.] (Pages 20-1.)

*Miscellaneous provisions relative to education and the schools.*

AN ACT to regulate the uniformity of and to provide free school text-books in public schools throughout the State, and the distribution of the same, and to repeal all statutes and acts contravening the provisions of this act.

(153.) § 4775. SECTION 1. The people of the State of Michigan enact, that from and after June thirtieth, eighteen hundred and ninety, each school board of the State shall purchase, when authorized, as hereinafter provided, the text-books used by the pupils of the schools in its district in each of the following subjects, to wit: Orthography, spelling, writing, reading, geography, arithmetic, grammar (including language lessons), national and State history, civil government, and physiology and hygiene; but text-books once adopted under the provisions of this act shall not be changed within five years: Provided, That the text-book on the subject of physiology and hygiene must be approved by the State board of education, and shall in every way comply with section fifteen of act number one hundred and sixty-five of the public acts of eighteen hundred and eighty-seven, approved June ninth, eighteen hundred and eighty-seven: And provided further, That all text-books used in any school district shall be uniform in any one subject. [Act 147, 1889.] (Pages 53-4.)

*Certain text-books, etc., duty of the board relating thereto.*

(256.) § 1827. SEC. 16. The said board shall examine all text-books in physiology and hygiene offered for use in the public schools of this State, and approve

those only which comply with the law relative to the space required to be devoted to the consideration of the nature and effects of alcoholic drinks and narcotics, as provided in act one hundred and sixty-four of the public acts of eighteen hundred and eighty-seven. \* \* \* (Page 90.)

NOTE.—The act of 1887 referred to is act 165 instead of 164. It amends sec. 15, ch. 3, of the general laws of 1881 relative to public instruction, and will be found in section 4980. See Comp., section 58, *ante*.

#### MINNESOTA.

[From Laws of Minnesota Relating to the Public School System, 1901 (page 111).]

§ 365 (1894, § 3892). *In physiology and hygiene*.—It shall be the duty of the boards of education and trustees in charge of schools and educational institutions supported in whole or in part by public funds to make provision for systematic and regular instruction in physiology and hygiene, including special reference to the effects of stimulants and narcotics upon the human system.

§ 366 (1894, §§ 3893, 3894). *Teachers to be examined and give instruction in*.—It shall be the duty of all teachers in public schools of the State to give systematic and regular instruction in physiology and hygiene, including special reference to the effects of stimulants and narcotics upon the human system; and any neglect or refusal on the part of such teachers to provide instruction as aforesaid shall be deemed sufficient cause for annulling his or her certificate by the county superintendent or other competent officer. No certificate shall be granted any person to teach in the public schools of this State \* \* \* who has not passed a satisfactory examination in physiology and hygiene, with special reference to the effects of stimulants and narcotics upon the human system.

It is for the board of education, in a fair endeavor to observe the requirements of the law, and subject, of course, to your review, to determine to what extent, in what grades, and by what means instruction upon the subjects named shall be imparted. (Attorney General Childs to State Superintendent, June 4, 1895.)

§ 367 (1894, § 3895). *Duty of county superintendent*.—It shall be the duty of the county superintendent of schools to report to the superintendent of public instruction any failure or neglect on the part of any board of education or trustees of a school or institution receiving aid in whole or in part from the State to make provision for the instruction aforesaid, and such failure or neglect being satisfactorily proven by the county superintendent or by other persons, it shall be sufficient warrant upon which the superintendent of public instruction may withhold the apportionment of the current school fund from such district; provided, that not more than one-fourth of said apportionment shall be withheld upon the first offense, one-third upon the second, and one-half upon any subsequent offense.

The withholding of an apportionment is a harsh measure and should not be inflicted upon a district unless it is obvious that the infraction has been willful. (Childs, May 13, 1895.)

§ 368 (1894, § 3896). *Text-book*.—The superintendent of public instruction and the presidents of the normal schools of this State are directed to recommend some suitable text-book, and to furnish the same at cost to the several school districts of this State, for the study of physiology and hygiene, with special reference to the effects of stimulants and narcotics upon the human system.

#### MISSISSIPPI.

[From School Laws of Mississippi, 1900 (pages 27, 43).]

#### *Examination of teachers.*

SEC. 4022. To obtain a first-grade license the applicant must be examined on spelling, reading, practical and mental arithmetic, geography, English grammar and composition, United States history, history of Mississippi, elements of natural philosophy, civil government, elements of physiology and hygiene with special

reference to the effects of alcohol and narcotics on the human system; and to obtain a second-grade license the applicant must be examined on spelling, reading, mental arithmetic, practical arithmetic, elementary geography, elementary English grammar and composition, and primary United States history, and primary physiology with special reference to the effects of alcohol and narcotics on the human system; but a teacher otherwise qualified shall not be refused a certificate to teach for the next two years by reason of a want of sufficient knowledge on the subject of physiology.

SEC. 4033. To obtain a third-grade license the applicant must be examined on the subjects required for second grade and must make thereon an average of not less than sixty per centum, with not less than forty per centum on any subject.

*State board of examiners.* (Act approved March 18, 1896.)

SEC. 7. Any teacher may secure a State license by passing a satisfactory examination, in the presence of the county superintendent or other authorized agent of the State board of examiners, in spelling, reading, practical and mental arithmetic, geography, English grammar and composition, United States history, Mississippi history, elements of natural philosophy, civil government, elements of physiology and hygiene with special reference to the effects of alcohol and narcotics on the human system, \* \* \*

#### MISSOURI.

[From School Laws of the State of Missouri, 1899.]

SEC. 9799. *Instruction in physiology and hygiene.*—Physiology and hygiene, including their several branches, with special instruction as to the effect of alcoholic drinks, narcotics, and stimulants on the human system, shall constitute a part of the course of instruction and be taught in all schools supported wholly or in part by public money or under State control. [R. S., 1889, § 8024, amended, Laws, 1897, p. 233.] (Page 46.)

#### *Examination for teachers' certificates.*

SEC. 9958. \* \* \* Teachers shall be granted a third-grade certificate who are of good moral character and who shall pass a satisfactory examination upon the following branches: Arithmetic, language lessons, English grammar, geography, spelling, reading, penmanship, United States history, civil government (including State government), and physiology and hygiene with special reference to the effect of alcoholic drinks and stimulants and narcotics generally upon the human system. \* \* \* (Page 82.)

Examination for first and second grade certificates same as the foregoing, with certain additional subjects.—(ED.)

#### MONTANA.

[From School Laws of the State of Montana, 1899 (pages 56-57).]

#### *Schools—Course of study.*

SECTION 1861. All common schools shall be taught in the English language, and instruction shall be given in the following branches, viz: Reading, penmanship, orthography, written arithmetic, mental arithmetic, geography, English grammar, physiology and hygiene with special reference to the effect of alcoholic stimulants and narcotics on the human system, history of the United States, civics of the United States and of Montana. Attention must be given during the entire school course to the cultivation of manners, to the laws of health, physical exercise, ventilation, and temperature of the school room.

## NEBRASKA.

[From The School Laws and School Land Laws of Nebraska, 1901 (page 50).]

SEC. 5a. *Scientific temperance instruction*.—Provisions shall be made by the proper local school authorities for instructing the pupils in all schools supported by public money, or under State control, in physiology and hygiene with special reference to the effects of alcoholic drinks and other stimulants and narcotics upon the human system.

SEC. 6. *Examination*.—No certificate shall be granted to any person to teach in the public schools of the State of Nebraska after the first day of January, eighteen hundred and eighty-six, who has not passed a satisfactory examination in physiology and hygiene with special reference to the effects of alcoholic drinks and other stimulants and narcotics upon the human system.

## NEVADA.

[From State of Nevada School Laws, 1897 (page 5).]

*State board of education*. (Statutes 1895, p. 81.)

SEC. 4. The powers and duties of the board shall be as follows:

First. To prescribe and cause to be adopted a uniform series of text-books in the principal studies pursued in the public schools, to wit: Reading, writing, arithmetic, spelling, language, grammar, geography, history of the United States, physiology, and drawing. Special prominence shall be given in all public schools to the effect of alcoholic stimulants and of narcotics upon the human system. No school district shall be entitled to receive its pro rata of the public-school money unless such text-books on the above subjects as have been prescribed by the State board of education shall be used in all the public schools pursuing subjects covered by said text-books; and text-books shall not be changed oftener than once in four years. \* \* \*

## NEW HAMPSHIRE.

[From School Laws of the State of New Hampshire, 1901 (pages 27-28).]

*The school board*.

SEC. 6. (As amended by chapter 40 and chapter 50, Session Laws of 1895.) They shall prescribe in all mixed schools and in all graded schools above primary the studies of physiology and hygiene, having special reference to the effects of alcoholic stimulants and of narcotics upon the human system, and shall see that the studies so prescribed are thoroughly taught in said schools and that well-approved text-books upon these subjects are furnished to teachers and scholars.<sup>a</sup> \* \* \*

## NEW JERSEY.

[From New Jersey School Laws, 1902 (pages 104-105).]

*Nature and effect of alcohol and narcotics to be taught*.

237. The nature of alcoholic drinks and narcotics and their effects upon the human system shall be taught in all schools supported wholly or in part by public moneys as thoroughly and in the same manner as other like branches shall be taught, by the use of graded text-books in the hands of the pupils when other branches shall be thus taught, and orally only in the case of pupils unable to read.

<sup>a</sup> Section 2, chapter 40, Laws of 1895: If any member of the school board shall neglect or refuse to comply with the provisions of the first paragraph of section 6 he shall forfeit the sum of two hundred dollars.

In the text-books on physiology and hygiene the space devoted to the consideration of the nature of alcoholic drinks and narcotics and their effects upon the human system shall be sufficient for a full and adequate treatment of the subject. The failure or refusal of any district to comply with the provisions of this section shall be sufficient cause for withholding from such district the State appropriation.

*Teachers to be examined in physiology.*

238. No certificate shall be granted to any person to teach in the public schools, except to persons applying for special certificates to teach music, drawing, manual training, or other subjects not included in the usual school curriculum, who shall not have passed a satisfactory examination in physiology and hygiene with special reference to the nature of alcoholic drinks and narcotics and their effects upon the human system.

NEW MEXICO.

See District of Columbia.

NEW YORK.

[From the Consolidated School Law of the State of New York, 1901.]

TITLE V.—*School commissioners.*

SEC. 13. Every commissioner shall have power, and it shall be his duty: \* \* \*

5. To examine \* \* \* persons proposing to teach common schools within his district. \* \* \* No certificate shall be granted to any person to teach in the public schools of this State who has not passed a satisfactory examination in physiology and hygiene, with special reference to the effects of alcoholic drinks, stimulants, and narcotics upon the human system. \* \* \* (Pages 26, 28.)

TITLE VII, ARTICLE 6.—*Trustees.*

SEC. 47. It shall be the duty of the trustee or trustees of every school district, and they shall have power: \* \* \*

11. To establish rules for the government and discipline of the schools in their respective districts, and to prescribe the course of studies to be pursued in such schools. Provision shall be made for instructing pupils in all schools supported by public money, or under State control, in physiology and hygiene, with special reference to the effect of alcoholic drinks, stimulants, and narcotics upon the human system. (Pages 49, 50-51.)

TITLE VIII, ARTICLE 4.—*Boards of education.*

SEC. 15. The said board of education of every union free-school district shall severally have power, and it shall be their duty: \* \* \*

5. To make provision for the instruction of pupils in physiology and hygiene, with special reference to the effect of alcoholic drinks, stimulants, and narcotics upon the human system. (Page 77.)

TITLE XV, ARTICLE 6.—*Physiology and hygiene in the public schools.*

(As amended by sec. 1, ch. 901, Laws of 1896.)

SEC. 19. The nature of alcoholic drinks and other narcotics and their effects on the human system shall be taught in connection with the various divisions of physiology and hygiene as thoroughly as are other branches in all schools under State control or supported wholly or in part by public money of the State, and also in all schools connected with reformatory institutions. All pupils in the above-mentioned schools below the second year of the high school and above the third year of school work, computing from the beginning of the lowest primary, not

kindergarten, year, or in corresponding classes of ungraded schools, shall be taught and shall study this subject every year with suitable text-books in the hands of all pupils, for not less than three lessons a week for ten or more weeks, or the equivalent of the same in each year, and must pass satisfactory tests in this as in other studies before promotion to the next succeeding year's work; except that where there are nine or more school years below the high school, the study may be omitted in all years above the eighth year and below the high school, by such pupils as have passed the required tests of the eighth year. In all schools above mentioned all pupils in the lowest three primary, not kindergarten, school years, or in corresponding classes in ungraded schools, shall each year be instructed in this subject orally for not less than two lessons a week for ten weeks, or the equivalent of the same in each year, by teachers using text-books adapted for such oral instruction as a guide and standard, and such pupils must pass such tests in this as may be required in other studies before promotion to the next succeeding year's work. Nothing in this act shall be construed as prohibiting or requiring the teaching of this subject in kindergarten schools. The local school authorities shall provide needed facilities and definite time and place for this branch in the regular courses of study. The text-books in the pupils' hands shall be graded to the capacities of fourth year, intermediate, grammar, and high-school pupils, or to corresponding classes in ungraded schools. For students below high-school grade, such text-books shall give at least one-fifth their space, and for students of high-school grade, shall give not less than twenty pages, to the nature and effects of alcoholic drinks and other narcotics. This subject must be treated in the text-books in connection with the various divisions of physiology and hygiene, and pages on this subject in a separate chapter at the end of the book shall not be counted in determining the minimum. No text-book on physiology not conforming to this act shall be used in the public schools, except so long as may be necessary to fulfill the conditions of any legal adoption existing at the time of the passage of this act. All regents' examinations in physiology and hygiene shall include a due proportion of questions on the nature of alcoholic drinks and other narcotics and their effects on the human system.

SEC. 20. In all normal schools, teachers' training classes, and teachers' institutes adequate time and attention shall be given to instruction in the best methods of teaching this branch, and no teacher shall be licensed who has not passed a satisfactory examination in the subject and the best methods of teaching it. On satisfactory evidence that any teacher has willfully refused to teach this subject, as provided in this act, the State superintendent of public instruction shall revoke the license of such teacher. No public money of the State shall be apportioned by the State superintendent of public instruction or paid for the benefit of any city until the superintendent of schools therein shall have filed with the treasurer or chamberlain of such city an affidavit, and with the State superintendent of public instruction a duplicate of such affidavit, that he has made thorough investigation as to the facts, and that to the best of his knowledge, information, and belief all the provisions of this act have been complied with in all the schools under his supervision in such city during the last preceding legal school year; nor shall any public money of the State be apportioned by the State superintendent of public instruction, or by school commissioners, or paid for the benefit of any school district, until the president of the board of trustees, or in the case of common-school districts the trustee or some one member of the board of trustees, shall have filed with the school commissioner having jurisdiction an affidavit that he has made thorough investigation as to the facts, and that to the best of his knowledge, information, and belief all the provisions of this act have been complied with in such district, which affidavit shall be included in the trustees' annual

report: and it shall be the duty of every school commissioner to file with the State superintendent of public instruction an affidavit in connection with his annual report showing all districts in his jurisdiction that have, and those that have not, complied with all the provisions of this act, according to the best of his knowledge, information, and belief, based on a thorough investigation by him as to the facts; nor shall any public money of the State be apportioned or paid for the benefit of any teachers' training class, teachers' institute, or other school mentioned herein, until the officer having jurisdiction or supervision thereof shall have filed with the State superintendent of public instruction an affidavit that he has made a thorough investigation as to the facts, and that to the best of his knowledge, information, and belief all the provisions of this act relative thereto have been complied with. The principal of each normal school in the State shall, at the close of each of their school years, file with the State superintendent of public instruction an affidavit that all the provisions of this law applicable thereto have been complied with during the school year just terminated, and until such affidavit shall be filed no warrant shall be issued by the State superintendent of public instruction for the payment by the treasurer of any part of the money appropriated for such school. It shall be the duty of the State superintendent of public instruction to provide blank forms of affidavit required herein for use by the local school officers, and he shall include in his annual report a statement showing every school, city, or district which has failed to comply with all the provisions of this act during the preceding school year. On complaint by appeal to the State superintendent of public instruction by any patron of the schools mentioned in the last preceding section, or by any citizen, that any provision of this act has not been complied with in any city or district, the State superintendent of public instruction shall make immediate investigation, and on satisfactory evidence of the truth of such complaint shall thereupon and thereafter withhold all public money of the State to which such city or district would otherwise be entitled, until all the provisions of this act shall be complied with in said city or district, and shall exercise his power of reclamation and deduction under section nine of article one of title two of the consolidated school law. (Pages 104-106.)

## NORTH CAROLINA.

[From Public School Law of North Carolina, 1901.]

SEC. 37. \* \* \* The branches taught in the public schools shall be orthography, defining [reading], writing, drawing, arithmetic, geography, grammar, language lessons, history of North Carolina, including the constitution of the State, history of the United States, including the Constitution of the United States, physiology, hygiene, nature and effect of alcoholic drinks and narcotics, elements of civil government, elements of agriculture, theory and practice of teaching, and such other branches as the State board of education may direct. \* \* \* (Page 25.)

AN ACT to establish a text-book commission (ratified February 8, 1901).

SEC. 2. \* \* \* It shall not be lawful for any school officer, director, or teacher to use any other books upon the same branches other than those adopted by said State text-book commission. Said uniform series shall include the following branches, to wit: Orthography, defining, reading, writing, drawing, arithmetic, geography, grammar, language lessons, history of North Carolina, containing the constitution of the State, history of the United States, containing the Constitution of the United States, physiology, hygiene, nature and effect of alcoholic drinks and narcotics, elements of civil government, elements of agriculture, theory and practice of teaching: \* \* \*. (Page 40.)

## NORTH DAKOTA.

[From School Laws of North Dakota, 1901 (page 59).]

SEC. 750. *Branches to be taught in all schools.*—Each teacher in the common schools shall teach pupils, when they are sufficiently advanced to pursue the same, the following branches: Orthography, reading, spelling, writing, arithmetic, language lessons, English grammar, geography, United States history, civil government, physiology, and hygiene, giving special instruction concerning the nature of alcoholic drinks, stimulants, and narcotics, and their effect upon the human system; physiology and hygiene and the nature of alcoholic drinks, stimulants, and narcotics, and their effect upon the human system, shall be taught as thoroughly as any branch is taught, by the use of a text-book to all pupils able to use a text-book who have not thoroughly studied that branch, and orally to all other pupils. When such oral instruction is given as herein required, a sufficient time, not less than fifteen minutes, shall be given to such oral instruction for at least four days in each school week. Each teacher in special school districts and in cities organized for school purposes under special law shall conform to and be governed by the provisions of this section.

## OHIO.

[From Ohio School Laws, 1900 (pages 142-3).]

(Bates's Ann. O. Stats., Sec. 4020, 23-25.)

SEC. 1. (*Instruction in the effects of alcoholic drinks and other narcotics made a regular branch of study.*)—The nature of alcoholic drinks and other narcotics, and their effects on the human system, in connection with the various divisions of physiology and hygiene, shall be included in the branches to be regularly taught in the common schools of the State, and in all educational institutions supported wholly or in part by money from the State; and it shall be the duty of boards of education and boards of such educational institutions to make suitable provisions for this instruction in the schools and institutions under their respective jurisdiction, giving definite time and place for this branch in the regular course of study, and to adopt such methods as will adapt the same to the capacity of pupils in the various grades and to corresponding classes as found in ungraded schools; the same tests for promotion shall be required in this as in other branches.

SEC. 2. (*Instruction required in teachers' institutes and teachers' training schools; teachers' certificate must contain; enforcement of law.*)—In all teachers' institutes, also in all normal schools and teachers' training classes which shall hereafter be established by the State, adequate time and attention shall be given to instruction in the best methods of teaching this branch. No certificate shall be granted to any person to teach in the common schools or in any educational institution supported as aforesaid who does not pass a satisfactory examination on this subject and the best methods of teaching the same. It shall be the duty of the State commissioner of common schools to see that the provisions in this section relating to county teachers' institutes, and schools and classes by whatever name hereafter established for training teachers, and the examination of teachers, are carried out; and said commissioner shall each year make full report of the enforcement of said section in connection with his annual report.

SEC. 3. (*Penalty for failure to enforce law; jurisdiction of courts.*)—Any school official, or any employee in any way concerned in the enforcement of the act, who willfully refuses or neglects to provide for or to give the instruction required by this act shall be fined, and shall pay for each offense the sum of twenty-five dollars. Mayors, justices of the peace, and probate judges shall have concurrent

jurisdiction with the common pleas court to try the offenses described in this act, and all fines or penalties collected under this act shall be paid into the general county school fund of the county in which such fine or penalty was collected.

## OKLAHOMA.

See District of Columbia.

## OREGON.

[From Oregon School Laws, 1901 (pages 53-4).]

TITLE VIII.—*School teachers.*

SEC. 56. 3. \* \* \* It is hereby made the duty of every teacher to give, and of every board of school directors to cause to be given, to all pupils suitable instruction in physiology and hygiene, with special reference to the effects of alcoholic drinks, stimulants, and narcotics upon the human system. Such instructions in physiology and hygiene shall be given orally to pupils who are below the fourth grade, and shall be given by the use of text-books to all pupils above the fourth grade, and such instruction shall be given as thoroughly to all pupils as instruction in arithmetic or geography is given. Each teacher of a public school, before leaving the school register with the school clerk, shall certify therein whether instruction has been given in the school or grade presided over by such teacher as required by this act, and no public money shall be paid over to the treasurer of a district unless the register of such district contains a certificate of the teacher that instruction has been given in physiology and hygiene, with special reference to the effects of alcoholic drinks, stimulants, and narcotics upon the human system, as required by this act.

## PENNSYLVANIA.

[From The Common School Laws of Pennsylvania, 1901. Act April 2, 1885, secs. 1-3; P. L., p. 7.]

CCCVII. That physiology and hygiene, which shall, in each division of the subject so pursued, include special reference to the effect of alcoholic drinks and stimulants and narcotics upon the human system, shall be included in the branches of study now required by law to be taught in the common schools, and shall be introduced and studied as a regular branch by all pupils in all departments of the public schools of the Commonwealth, and in all educational institutions supported wholly or in part by money from the Commonwealth. (Pages 299-300.)

CCCVIII. It shall be the duty of county, city, borough superintendents, and boards of all educational institutions receiving aid from the Commonwealth, to report to the superintendent of public instruction any failure or neglect on the part of boards of school directors, boards of school controllers, boards of education, and boards of educational institutions receiving aid from the Commonwealth, to make proper provision in any and all of the schools or districts under their jurisdiction for instruction in physiology and hygiene, which, in each division of the subject so pursued, gives special reference to the effects of alcoholic drinks, stimulants, and narcotics upon the human system, as required by this act; and such failures on the part of directors, controllers, boards of education, and boards of educational institutions receiving money from the Commonwealth, thus reported or otherwise satisfactorily proven, shall be deemed sufficient cause for withholding the warrant for State appropriation of school money to which such district or educational institution would otherwise be entitled. (Page 301.)

CCXCIX. No certificate shall be granted any person to teach in the public schools of the Commonwealth or in any of the educational institutions receiving money from the Commonwealth, after the first Monday of June, Anno Domini one

thousand eight hundred and eighty-six, who has not passed a satisfactory examination in physiology and hygiene, with special reference to the effects of alcoholic drinks, stimulants, and narcotics upon the human system. (Page 302.)

*Notes by the Superintendent of Public Instruction.*

158. Regular daily instruction must be given in physiology and hygiene the same as in other legal branches of study, otherwise the law authorizing and requiring the introduction and study of this branch will not be fairly complied with.

159. Oral instruction, from the necessity of the case, may be given by the teachers in charge of the primary grades of the schools in which the children are too young to make profitable use of text-books on the subject. But suitable books, properly adapted to the age and comprehension of the pupil, must be studied by all scholars who are capable of learning in this way.

160. The subject must be systematically studied as well as taught, which can not be done successfully without text-books in the hands of the scholars. The proper preparation of the lessons assigned to the pupils in the daily exercise of the schools makes the use of text-books absolutely necessary, even if the law did not peremptorily require their general introduction, as it does in this instance.

161. It is the duty of directors and controllers to see that the provisions of the law are fully complied with in all departments of the schools under their official jurisdiction, and in the performance of this duty they ought to have the hearty cooperation of the patrons of the schools. (Pages 302-3.)

RHODE ISLAND.

[From Rhode Island Laws Pertaining to Education, 1900 (page 55).]

CHAP. 60, SEC. 7. The school committees of the several towns shall make provision for the instruction of the pupils in all schools supported wholly or in part by public money in physiology and hygiene, with special reference to the effects of alcoholic liquors, stimulants, and narcotics upon the human system.

SOUTH CAROLINA.

[From The School Law of South Carolina, 1901 (page 22).]

*Branches taught.*

SEC. 27. It shall be the duty of the county board of education and of the boards of trustees hereinafter provided for to see that in every school under their care there shall be taught, as far as practicable, orthography, reading, writing, arithmetic, geography, English grammar, the elements of agriculture, history of the United States and of this State, the principles of the Constitution and laws of the United States and of this State, morals and good behavior, algebra, physiology and hygiene, and especially as to the effects of alcoholic liquors and narcotics upon the human system, English literature, and such other branches as the State board may from time to time direct.

SOUTH DAKOTA.

[From The Compiled School Laws of South Dakota, 1901 (page 45).]

CHAP. VIII, SEC. 14. *Branches to be taught.*—Instruction shall be given in the common schools of the State in the following branches, in the several grades in which each may be required, viz: Reading, writing, orthography, arithmetic, geography, primary language and English grammar, history of the United States, physiology and hygiene, with special instruction as to the nature of alcoholic drinks and their effects upon the human system, and civil government.

TENNESSEE.

[From Public School Laws of Tennessee, 1901 (pages 19-20); acts 1895, chap. 180.]

SEC. 31. (4) In addition to the branches in which instruction is now given in the public schools of this State, physiology and hygiene, with a special reference

to the nature of alcoholic drinks and narcotics and smoking cigarettes, and their effects upon the human system, shall also be taught as thoroughly as other required branches, and shall be made a regular course of study for all pupils in all schools supported entirely or in part by public money.

(5) No certificate shall be granted to any person to teach in the public schools of this State after the first of January, 1896, who has not passed a satisfactory examination in physiology and hygiene, with special reference to the effects of alcoholic drinks and narcotics and cigarette smoking upon the human system.

## TEXAS.

[From School Laws of Texas, 1901.]

SEC. 19. All public schools in this State shall be required to have taught in them orthography, reading in English, penmanship, arithmetic, English grammar, modern geography, composition, physiology and hygiene, including the effects of alcoholic stimulants and narcotics on the human system, mental arithmetic, Texas history, United States history and civil government, and other branches as may be agreed on by the trustees or directed by the State superintendent. (Page 9.) [Art. 3909a, R. S., as amended by the 27th Leg.]

SEC. 69. An applicant for a third grade certificate shall be examined in spelling, reading, writing, arithmetic, English grammar, geography, Texas history, elementary physiology and hygiene and the laws of health, with special reference to narcotics, and school management and methods of teaching. \* \* \* (Page 32.) [Art. 3974, R. S., as amended by the 26th Leg.]

## UTAH.

[From School Law of Utah, 1901 (page 32).]

*Physiology and hygiene.*

CH. VII, SEC. 15. It shall be the duty of all boards of education and trustees in charge of schools and educational institutions supported in whole or in part by public funds to make provision for systematic and regular instruction in physiology and hygiene, including special reference to the effects of stimulants and narcotics upon the human system.

## VERMONT.

[From General Laws of the State of Vermont Relating to Public Instruction, 1895 (page 188).]

*Studies.*

SEC. 688. \* \* \* All pupils shall be thoroughly instructed in good behavior, reading, writing, spelling, English grammar, geography, arithmetic, free-hand drawing, the history and Constitution of the United States, and in elementary physiology and hygiene, with special reference to the effect of alcoholic drinks and narcotics on the human system, \* \* \*.

## VIRGINIA.

[From Virginia School Laws, 1901 (pages 60-61).]

97. *Subjects to be taught.*— \* \* \* In teaching physiology and hygiene approved text-books shall be used, plainly setting forth the effects of alcohol and other narcotics on the human system, and such effects shall be as fully and thoroughly taught as other branches of said last-named subjects. \* \* \* (Acts 1899-1900, ch. 132, p. 134.)

## WASHINGTON.

[From School Laws of the State of Washington, 1901.]

*Subjects to be taught.*

SEC. 65. All common schools shall be taught in the English language, and instruction shall be given in the following branches, viz: Reading, penmanship, orthography, written arithmetic, mental arithmetic, geography, English grammar, physiology and hygiene, with special reference to the effects of alcoholic stimulants and narcotics on the human system, history of the United States, and such other studies as may be prescribed by the State board of education. \* \* \* (Page 48.)

*Penalties.*

SEC. 163. Upon complaint in writing being made to any county superintendent by any district clerk, or by any head of family, that the board of directors of the district of which said clerk shall hold his office, or said head of family shall reside, have failed to make provision for the teaching of hygiene, with special reference to the effects of alcoholic drink, stimulants, and narcotics upon the human system, as provided in this act, in the common schools of such district, it shall be the duty of such county superintendent to investigate at once the matter of such complaints, and if found to be true he shall immediately notify the county treasurer of the county in which such school district is located; and after the receipt of such notice it shall be the duty of such county treasurer to refuse to pay any warrants drawn upon him by the board of directors of such district subsequent to the date of such notice and until he shall be notified to do so by such county superintendent. Whenever it shall be made to appear to the said county superintendent, and he shall be satisfied that the board of directors of such district are complying with the provisions of said section of this act, and are causing physiology and hygiene to be taught in the public schools of such district, as hereinbefore provided, he shall notify said county treasurer, and said treasurer shall thereupon honor the warrants of said board of directors.

SEC. 163. Any county superintendent of common schools who shall fail or refuse to comply with the provisions of the preceding section shall be liable to a penalty of one hundred dollars, to be recovered in a civil action in the name of the State in any court of competent jurisdiction, and the sum recovered shall go into the State school fund; and it shall be the duty of the prosecuting attorneys of the several counties of the State to see that the provisions of this section are enforced. (Pages 89-90.)

## WEST VIRGINIA.

[From The School Law of West Virginia, 1897 (page 17).]

*Nature and effects of alcoholic drinks must be taught.*

11a. I. That the nature of alcoholic drinks and narcotics and special instruction as to their effects upon the human system, in connection with the several divisions of the subject of physiology and hygiene, shall be included in the branches of study taught in the common or public schools, and shall be taught as thoroughly and in the same manner as other like required branches are in said schools, and to all pupils in all said schools throughout the State.

*Fine for failing to teach.*

II. It shall be the duty of the proper officer in control of any school described in the foregoing section to enforce the provisions of this act, and any such officer, school director, committee, superintendent, or teacher who shall refuse or neglect

to comply with the requirements of this act, or shall neglect or fail to make proper provisions for the instruction required and in the manner specified by the first section of this act, for all pupils in each and every school under his jurisdiction, shall be removed from office and the vacancy filled as in other cases.

*Teachers to be examined.*

III. No certificate shall be granted to any person to teach in the public schools of the State, after the first of January, anno Domini eighteen hundred and eighty-nine, who has not passed a satisfactory examination in physiology and hygiene, with special reference to the nature and the effects of alcoholic drinks and narcotics upon the human system.

WISCONSIN.

[From School Laws of Wisconsin, 1901.]

*Physiology and hygiene.*

SEC. 447a. Provision shall be made by the proper local school authorities for instructing all pupils in all schools supported by public money or under State control in physiology and hygiene with special reference to the effects of stimulants and narcotics upon the human system. The text-books used in giving such instruction shall have the joint approval of the State superintendent and the State board of health. (Pages 50-1.)

NOTE BY STATE SUPERINTENDENT.—This section contemplates instruction in physiology and hygiene for all pupils sufficiently advanced in age and scholarship with special reference to the effects of stimulants and narcotics upon the human system. Under the guidance of an approved book, oral instruction in this topic may be given to pupils that are too immature to be benefited by the use of a text-book.

The effectiveness of the work in this branch, so far as its oral presentation is concerned, will depend on the simplicity of the instruction and the good judgment of the teacher in avoiding abstruse and offensive statements. In all instruction given under this law the subject of anatomy should be considered as taking a secondary place. (Page 51.)

*Teachers' certificates.*

SEC. 450. Every applicant for a certificate shall be examined in the subjects hereinafter mentioned for the several grades respectively as follows: For the third grade, in orthoepy, orthography, reading, penmanship, arithmetic, English grammar, geography, the history of the United States, the Constitution of the United States, the constitution of the State of Wisconsin, physiology and hygiene, with special reference to the effects of stimulants and narcotics upon the human system, \* \* \*. (Page 52.)

For second and first grade certificates, certain additional subjects are named.—(ED.)

WYOMING.

[From School Laws of the State of Wyoming, 1901 (pages 38, 39).]

*Physiology and hygiene shall be taught.*

SEC. 612. Physiology and hygiene, which shall include in each division of the subject special reference to the effects of alcohol and narcotics upon the human system, shall be included in the branches taught in the common schools of the State, and shall be introduced and taught, either orally or by text-book, in all departments of the public schools above the second primary grade and in all educational institutions supported wholly or in part by the State. (R. S. 1887, sec. 3969.)

*Failure to comply with last section—Penalty.*

SEC. 613. It shall be the duty of the several county and city superintendents of schools in the State, and of the secretary of the board of directors of all other educational institutions receiving aid from the State, to report to the State superintendent of public instruction any failure or neglect on the part of the board of trustees of any school district, or the board of directors of any educational institution receiving aid from the State, to make proper provision for the teaching of the branches mentioned in the last preceding section in any or all of the schools or other educational institutions under their charge, or over which they have jurisdiction, and such failure on the part of the above-mentioned officers, so reported and satisfactorily proved, shall be deemed sufficient cause for withholding the warrant for the district appropriation of school money to which such school district or educational institution would otherwise be entitled. (R. S. 1887, sec. 3970.)

*Examinations required.*

SEC. 615. No certificate shall be granted hereafter to any person to teach in the schools of Wyoming who shall not pass a satisfactory examination in physiology and hygiene, with special reference to the effects of alcoholic drinks, stimulants, and narcotics upon the human system. (R. S. 1887, sec. 3972.)

## CHAPTER VII.

### NECROLOGY FOR 1899, 1900, AND 1901.

---

#### UNITED STATES.

1899.

ABBOTT, ALEX. HAMILTON, in Farmington, Me., April 15; born there September 14, 1822; fitted for college at the academy of his native town and graduated at Bowdoin College in 1840. For eight years he was preceptor of Farmington Academy, and principal of Abbott Family School 1849-1863 and 1876 until his death. During this time he served three years as supervisor of schools, Franklin County, and for a like period on the board of trustees of normal schools.

ABBOTT, WILLIAM WHITTLESEY, in Worcester, Mass., July 7; born in Uxbridge, Mass., August 5, 1836; fitted for college at the high school at Yarmouth, Me.; graduated at Yale in 1877, studied further at Sheffield Scientific School and Worcester Polytechnic Institute. He taught at Sheffield (Mass.) High School, having oversight at the same time of the other schools in the town; was principal of the high school and superintendent of all the schools in Naugatuck, Conn; was superintendent of schools of the five towns in Berkshire County, Mass., viz, Sheffield, Richmond, West Stockbridge, New Marlboro, and Egremont. Failing health caused him to retire.

ABBOTT, WILSON SMITH, in Manchester, N. H., February 1; born in Raymond, N. H., July 18, 1826; fitted for college at Hampton Academy and graduated at Dartmouth College in 1852; taught in Westminster and Brattleboro, Vt., 1852-1857. The remainder of his life was devoted to teaching and farming in his native town; 1860-1861 he was commissioner of schools for Rockingham County and president of the New Hampshire Board of Education.

ABELL, ERASMUS DARWIN, M. D., in Farmington, Minn., October 2; born in Lempster, N. H., January 26, 1817; was educated in public schools and by private tutors, and graduated at Dartmouth Medical School in 1839; practiced in Sutton, Lempster, and Rindge, N. H., Chicopee, Mass., and Farmington, Minn. He was superintendent of schools in Lempster two years, and Rindge eleven years.

ALDEN, EBENEZER, in Marshfield, Mass., January 4; born in Randolph, Mass., August 10, 1819; fitted for college at Randolph Academy; graduated at Amherst College in 1839 and at Andover Theological Seminary in 1843. During an early pastorate in Iowa he was on the first board of trustees of Iowa College; occupied the pastorate at Marshfield thirty-five years, and while there conducted the funeral services of Daniel Webster, in accordance with the dying request of the statesman, who had been one of his parishioners.

- ALGER, HORATIO, in Natick, Mass., July 19; born in North Chelsea, now Revere, January 14, 1834; attended the public schools of his native town and graduated at Harvard College. Engaged in teaching and newspaper work and achieved wide reputation by his books for boys.
- ALLEN, CHARLES FREDERIC, D. D., in Portland, Me., February 9; born in Norridgewock, Me., January 28, 1816; fitted for college at Farmington Academy, and graduated at Bowdoin College in 1839. After a few years' teaching at St. Albans and as assistant principal of the Maine Wesleyan Seminary at Kents Hill, Me., he entered the ministry of the Methodist Episcopal Church. During 1871-1879 he was president of the State College of Agriculture and Mechanic Arts at Orono, Me. Returning to the work of the ministry he was active until past his seventy-ninth year.
- AMES, OAKES ANGLIER, in North Easton, Mass., September 19; born there April 15, 1829; was the eldest son of Oakes Ames, member of Congress from 1863 to 1873, and president of the shovel manufactory with which the Ames family has been connected for many years. The son participated in the gift of a schoolhouse to North Easton, and with his brother erected a \$60,000 townhall.
- ANDREWS, Gen. GEORGE LEONARD, in Brookline, Mass., April 4; born in Bridgewater, Mass., August 31, 1828; fitted at Bridgewater Normal School; graduated at West Point Military Academy in 1851; was engaged in engineering work under the Government at Fort Warren, Lake Champlain, and Sandy Hook; served through the war of the rebellion; was a planter in Mississippi; assistant professor of engineering at West Point Military Academy, 1854-55; professor of French at the same institution, 1871-1882, and advanced to the chair of modern languages in 1882. He retired in 1892.
- APPLETON, WILLIAM HENRY, in Riverdale, N. Y., October 19; born in Haverhill, Mass., January 27, 1814; was educated in private and public schools and Phillips Academy, Andover, Mass. His father, Daniel Appleton, who had been a dry goods merchant in Haverhill, removed to New York City in 1825, and with his dry goods sold books. William had charge of the latter department from which developed the publishing house of D. Appleton & Co., of which he was for years the head. Their publications began with a small book 3 inches square and half an inch thick. They published among other books Webster's Speller and the American Encyclopædia. Mr. Appleton was an early and persistent advocate of international copyright. He was engaged in many large commercial enterprises, prominent in the church, a member of a number of the prominent clubs. To him is due the erection and endowment of the Appleton Church Home for Orphan Girls at Macon, Ga.
- ATKINSON, WILLIAM YATES, in Newnan, Ga., August 8; born in Oakland, Ga., November 10, 1854; graduated at the University of Georgia in 1877; was admitted to the bar in 1878; appointed by Governor Colquitt in 1879, he was solicitor of the Coweta County court three years; a member of the legislature 1886, 1888, 1890, and 1892, being speaker of the house during the last year; governor of Georgia 1894 and 1896. He founded the Georgia Normal and Industrial College for Girls at Milledgeville, and was president of its board of trustees; a trustee of the University of Georgia.
- BAILEY, JAMES MONROE, D. D., in Saco, Me., January 6; born in Andover, N. H., March 3, 1817; fitted for college at New Hampton (N. H.) Academical Institute; graduated at Dartmouth College in 1843 and at Andover Theological Seminary in 1846; was pastor at West Buxton, Portland, Saco, Me., Manchester and Somersworth, N. H.; superintendent of schools at Saco, Me., and for twenty years professor of sacred literature and homiletics in the New Hampton Theological Institute.

- BAILEY, WILLIAM WALLACE, in Nashua, N. H., June 9; born in Hopkinton, N. H., November 11, 1829; graduated at Dartmouth College in 1854; studied law in the offices of George and Foster, Concord, N. H., and graduated at the Albany Law School in 1856; was a representative in the New Hampshire legislature, 1863-64; trustee of the New Hampshire College of Agriculture and the Mechanics Arts, 1871-1876; director in a number of enterprises; trustee of the State library; member of the Nashua board of education and trustee of the public library of that city.
- BARDWELL, ELIZABETH MILLER, in Greenfield, Mass., May 27; born in Colerain, Mass., December 4, 1831; graduated from Shelburne Falls Academy and taught for a number of years, then entered Mount Holyoke and graduated in 1866. She began teaching in Holyoke the next year and continued until 1886; taught algebra, trigonometry, and physics. After 1886 devoted herself to astronomy. She was a member of the Astronomical Society of the Pacific and of the British Astronomical Society.
- BARROWS, WALTER MANNING, D. D., at Mackinac Island, Mich., August 10; born in Franklin, Mich., April 12, 1846; fitted for college in the preparatory department of Olivet College and graduated from that college in 1867; studied theology at Yale Divinity School, Union Theological Seminary, and graduated at Andover Theological Seminary in 1873. Under the American Home Missionary Society he worked in Kansas and Salt Lake City, Utah, until 1881; was secretary of the society named 1882-1883; acting pastor at Second Church, Rockford, Ill., 1888-1898, and pastor of Second Church, Greenwich, Conn., 1898 till his death. He was a trustee of Beloit College 1891-1898, and of Rockford College 1899-1899, and was instrumental in organizing the New West Education Commission with its 30 schools and 3 academies.
- BARTLETT, HORACE E., in Haverhill (his birthplace), Mass., December 27; graduated at Dartmouth College in 1869; was principal of Lawrence and Haverhill, Mass., high schools for a number of years. Studied law at Boston University Law School, and in 1881 was associated in the practice of law with Congressman Moody; associate justice of the central district court of Essex County, Mass.
- BARTON, LYMAN, A. M., M. D., in Willsboro, N. Y., October 20; born in Hebron, N. Y., September 19, 1812; graduated from Dartmouth Medical School in 1839; practiced his profession in Willsboro, N. Y., 1839-1895. He was several times supervisor of schools, president and a founder of the Essex (N. Y.) County Medical Society; life member American Bible Society; member Medical Society of New York, 1867-1899, and also of New York Medical Association, 1884-1899.
- BASS, PERKINS, in Peterboro, N. H., October 9; born in Williamstown, Vt., April 30, 1827; fitted at Thetford (Vt.) and Kimball Union Academy, Meriden, N. H.; graduated at Dartmouth College in 1852; taught at Glover, Vt., 1852-53, at Chester (Vt.) Academy, 1853-54; principal Dearborn School, the first district school in Chicago, 1854-55; studied law at the same time. He was admitted to the bar in 1855 and gained a large practice. In 1861-62 he was acting president of the Illinois State Normal University; United States district attorney of northern Illinois under an appointment of President Lincoln in 1865; was removed by President Johnson in 1866; for many years was a member of the board of education of Illinois. Perkins Bass School in Chicago was named in his honor.
- BAUGHER, HENRY LOUIS, D. D., in Philadelphia, Pa., February 11; born in Gettysburg, Pa., August 6, 1840; fitted for college in the preparatory department of Pennsylvania College at Gettysburg, and graduated at Gettysburg College in

1857; taught at Uniontown, Md.; was a tutor in Pennsylvania College, 1857-58; taught in the normal and classical school, Quakertown, Pa., 1859-60; had temporary charge of a boys' school in Washington, D. C. He began the study of theology in the Gettysburg Theological Seminary, continued it in Andover Theological Seminary, being ordained by the Lutheran Church in 1863, and preached in Wheeling, W. Va., Norristown, Pa., and Indianapolis, Ind., until 1869; was Pearson professor of Greek language and literature in Pennsylvania College, 1869-1880; was professor of Greek one year in Howard University, Washington, D. C.; again professor of Greek in Pennsylvania College, 1883-1886. He filled the chair of Greek Exegesis in Gettysburg Theological Seminary, 1870-1874; and was acting professor of dogmatic theology in the same institution in 1883. He was a frequent contributor to the Lutheran press; a director for many years of Gettysburg Theological Seminary, and established the Baugher Lectureship on Christian Worship. He was elected president and professor of Didactic Theology in the Seminary of the United Synod of the South at Charleston, S. C., in 1898, but his health compelled him to decline the position.

BERRY, AUGUSTUS, in Pelham, N. H., October 4; born in Concord, N. H., October 7, 1824; fitted for college at Francestown (N. H.) Academy; graduated at Amherst College in 1851; studied theology at Andover Theological Seminary. He was principal of Limerick (Me.) Academy, 1851-1853; of Lyndon (Vt.) Academy, 1853-1855; of Appleton Academy (now McCollom Institute), Mount Vernon, N. H., 1855-1860. He occupied the pastorate of the church at Pelham, N. H., from 1861 to his death. For a number of years during his pastorate there he was superintendent of the public schools.

BLAIR, JOHN INSLEY, in Blairstown, N. J., December 2; born near Belvidere, N. J., August 2, 1802; iron founder, coal-mine owner, director or builder of twenty-five railroads. He gave an endowment fund of \$115,000 to the Presbyterian Academy in Blairstown, founded professorships in Princeton University and Lafayette College, erected Blair Hall at Princeton, besides generously aiding Western colleges.

BLAND, RICHARD PARKS, near Lebanon, Mo., June 15; born in Ohio County, Ky., August 19, 1835. When a boy attended winter school, working on a farm in the summer; was a pupil of the Hartford (Ky.) Academy one year. He taught in Kentucky and Mobile, Ala., in California, Nevada, and Colorado; was admitted to the bar in Utah in 1860. With the exception of one term he represented Missouri in Congress from 1872 until his death. He was specially known for his advocacy of free silver.

BOARDMAN, HENRY ELDERKIN JEWETT, in Chicago, Ill., April 14; born in Danville, Vt., June 21, 1829; graduated at Dartmouth College in 1850; taught in Shelbyville, Tenn., Greensboro, Ala., and Cumberland, Md.; professor of Latin and Greek at the University of Tennessee, Knoxville, 1854-1856; studied law and was admitted to the bar in Tennessee, but removed to Iowa, locating first at Marietta and later at Marshalltown. Among the large number of positions of trust he held was that of trustee of Iowa College.

BONNER, ROBERT, in New York City, July 6; born near Londonderry, Ireland, April 28, 1824; came to this country and began his career in the composing room of the Hartford Courant at \$25 a year and "found." In 1851 he bought the Merchants' Ledger, which he conducted successfully till 1887. Princeton College is indebted to him for \$19,000 toward its gymnasium fund; the-Fifth Avenue Presbyterian Church, of New York, for \$130,000, and many philanthropic enterprises were recipients of his generosity.

- BOPPE, C. HERM., editor of *Amerikanische Turnerzeitung*, in Milwaukee, Wis. Died January 12, 1899, in Milwaukee.
- BORN, PETER, D. D., in Selinsgrove, Pa., May 29; born in Lycoming County, Pa., July 3, 1820; graduated from Gettysburg College in 1848, and the theological seminary there in 1850; was pastor of the Lutheran Church at Sunbury, Pa., 1851-1859; principal of the classical department of missionary institute (now Susquehanna University), Selinsgrove, 1859-1881; superintendent and first professor in theology in the same institution, 1881-1895, when he became professor emeritus, though continuing to lecture in the theological department.
- BOSWORTH, BENJAMIN MILLER, in Warren, R. I., February 9; born there January 17, 1848; received a public-school education, studied law, teaching evening school in the meantime; was admitted to the bar in 1873; trial justice of Warren, 1874-1876; assistant attorney-general, 1882-1885; justice of the fifth district court, 1886-1897, and justice of the supreme court of Rhode Island from 1897 to his death. He was a member of the Warren school committee for twenty years, and acting superintendent for five years.
- BOWEN, H. C., in North Fenton, Broome County, N. Y., in July, aged 54 years. He studied abroad, and for twenty years was instructor in the school of mines at Columbia University.
- BOYD, DAVID FRENCH, in Baton Rouge, La., May 27; born in Wytheville, Va., in 1835; graduated at the University of Virginia, and began teaching in 1856; was professor of Latin in the Louisiana Military School in 1860; served through the civil war in the Confederate army; was superintendent of the Louisiana Military School ten years; occupied the same position in the military school at Cairo, Egypt; returned home and assumed the presidency of the University of Louisiana, of which he was practically the founder; was chosen president of the Alabama Agricultural and Mechanical College at Auburn; president of the Kentucky Military Institute in 1889; of the Michigan Military Academy at Orchard Lake, 1893, and in 1897 returned to the presidency of the University of Louisiana, where he was also professor of philosophy and civics.
- BRINTON, DANIEL GARRISON, M. D., LL. D., D. Sc., in Atlantic City, N. J., July 31; born in Thornburg, Pa., May 13, 1837; graduated at Yale College in 1858, and at the Jefferson Medical College at Philadelphia, Pa., in 1860. After a year's travel and study in Europe he began practice in West Chester, Pa.; served through the civil war as a surgeon; returned to West Chester, but soon removed to Philadelphia. For twenty years he edited the *Medical and Surgical Reporter*, as well as the *Compendium of Medical Science*, and many other professional publications. In 1884 he became professor of ethnology and archæology in the Academy of Natural Sciences of Philadelphia, and in 1886 professor of American archæology in the University of Pennsylvania. He was the author of a large number of ethnological and archæological publications, a member of several scientific and philosophical societies, commissioner to the exposition at Madrid in 1892, and a member of the jury of awards at the Columbian Exposition in Chicago.
- BROWN, HARRIET A., in New York City, January 13; an instructress at the Santee Normal Training School for Indians at Santee Agency, Nebr., for eighteen and a half years.
- BROWN, WILLARD DEMING, at Interlachen, Fla., September 25; born in New Haven, Vt., November 10, 1838; fitted for college at New Haven (now Beman) Academy and Fairfax (Vt.) Seminary; graduated at Middlebury College, 1866, and at Andover Theological Seminary in 1869; occupied the pastor-

ate at Gilbertville, 1887, until his death. He was a member of the Interlachen school board and a trustee of Rollins College at Winter Park, Fla., from 1889.

BRUCE, CHARLES EMERSON, in Malden, Mass., January 8; born in Hardwick, Mass., February 4, 1819; fitted for college at Shelburne Falls (Mass.) Academy; graduated at Amherst College in 1845, and at East Windsor (now Hartford) Seminary in 1848. From 1848 to 1861 he was engaged in teaching—at Northfield, Mass., Brattleboro, Vt., Keene, N. H., and Ashtabula, Ohio—and for a number of years was school examiner for Ashtabula County.

BRUNER, REV. DR. JAS. F., in Washington, D. C., November 19; born in Vincennes, Ind., 1822; graduated at Hanover (Mo.) College; served through the civil war as a surgeon and later entered the ministry of the Presbyterian Church, but resumed the practice of medicine on account of the failure of his voice. For a number of years he occupied the presidency of Pleasant Ridge (Mo.) College.

BRYSON, GEORGE, in Salt Lake City, Utah, December 12; born in London, England, about seventy-two years ago; held the position of instructor in French at an English institution for a number of years and had a large class in that subject in Salt Lake City.

BUTTERFIELD, CONSUL WILLSHIRE, in South Omaha, Nebr., September 25; born in Mexico, N. Y.; removed early to Ohio and was engaged in teaching; was appointed in 1848 superintendent of public schools in Seneca County, Ohio; later he practiced law in Bucyrus, Ohio, and Madison, Wis. Besides contributing to a large number of city, town, and county histories and biographical publications he edited several historical works.

CAMPBELL, DR. JAMES, at Hartford, Conn., in October; born in Manchester, Conn., March 14, 1848; received a liberal education, including a two years' course in medicine in Europe. From 1886 he was professor of obstetrics in the Yale Medical School.

CHADWICK, EDMUND, in Eddytown, N. Y., April 7; born in Middleton, N. H., January 12, 1812; fitted for college at Phillips (Exeter) Academy; spent one year at the Dartmouth Medical School; took the first half of the full course at Waterville College (now Colby), and finished at Bowdoin College in 1840; was principal for two years of a classical and mathematical institution at Nashville, Tenn.; began the study of theology at Lane Theological Seminary, and completed his course at Bangor in 1845; preached for a time at Franklin, N. H. He was principal of Starkey Seminary, Yates County, N. Y., 1847-1861, and of Dundee Academy 1863-1867. The remainder of his life was spent upon his homestead at Eddytown, N. Y.

CHICKERING, JOSEPH KNOWLTON, in Burlington, Vt., December 27; born in Portland, Me., July 20, 1846; fitted for college at the high school in his native city; graduated at Amherst College in 1869; was principal of Whittenton Grammar School, Taunton, Mass., one year, and submaster of the high school in that city for a like period; teacher of Latin in the Springfield (Mass.) High School, 1872-73; instructor in English, 1873-1877, and associate professor in the same department in Amherst College, 1877-1885; was professor of rhetoric and English literature in the University of Vermont, 1888-1893. He compiled a great many of the records of the alumni of Amherst College, was engaged in work upon the Century Dictionary of the Century Company, and was otherwise known in the literary world.

CILLEY, B. LONGFELLOW, Exeter, N. H., March 31, 1899; born in Nottingham, N. H., September 6, 1833; graduated at Harvard in 1858; taught in Albany High School a year; in 1859 became professor of ancient languages at Exeter Academy, which position he held until his death.

- CLAPP, A. H., D. D., April 27; born in Wellington, Mass., September 1, 1818; studied at the Adams and Fort Hill Grammar and English High School; some years clerk in Boston; fitted for college at Phillips, Andover, and Lester academies; graduated at Yale, 1842; graduated at Andover Seminary, 1845; temporary professor of rhetoric, Middlebury College, 1846; pastor, Providence, R. I., 1877-1885. From 1865 until his death he was editorial secretary and treasurer of the American Home Missionary Society in New York and wrote much for the press.
- CLARK, Miss MARIA, December 26, Hallowell, Me., over 92 years of age. Gave her property, including the Maria Clark School, to the city of Hallowell.
- CLARKE, F. E., Waukegan, Ill., July 29; born in Williamstown, Vt., March 4, 1828; fitted at Ludlow and Townsend, Vt.; graduated at Dartmouth, 1851; while principal of the academy, 1851-1854, read law; was county and city superintendent of schools, besides serving as banker and judge.
- CLARKE, J. M., Syracuse, N. Y., November 30; born in Bethany, Conn., October 6, 1827; graduated at Hobart College, 1847; deciding to enter the Episcopal ministry, was ordained deacon in 1852 and priest in 1853. From 1852-1858 was rector St. Peter's Church, Niagara Falls, N. Y.; from 1858 until his death was rector of St. James Church at Syracuse; was professor of exegesis at Nashotah Seminary, Wisconsin, from 1886 to 1891. He published "Was John Wesley a Methodist?"
- CLARKE, RUEL BAXTER, July 14; born in Sunderland, Mass., April 29, 1831; prepared for college at Franklin Academy and Shelburne Falls, Mass.; graduated at Amherst College, 1856; was principal of Hollis Institute, Mass., 1856-1858, also of Westminster and Saxtons River academies, 1858; of Rochester Academy, 1858-1860; of Reading High School, 1860-1865; of Fitchburg High School, 1865-1875. He was superintendent of schools and principal of Central High School of Binghamton, and subsequently principal of the following high schools: Waltham, Mass., 1876-1878; North Brookfield, Mass., 1878-1882, and Brimfield, Mass., 1883-84; Worcester, Mass., until his death.
- COLBURN, WILLIAM WALLACE, October 17; born in New Boston, N. H., October 1, 1832; graduated at Dartmouth, 1869; taught at Lawrence Academy, Groton, Mass., 1861-62; Belmont, Mass., 1862-63. Principal of high school, Manchester, 1873-74; Springfield, Mass., 1874-1890.
- COLE, EDMUND WHITEFORD, in New York City, May 25; born in Giles County, Tenn., 1832. For forty years was actively identified with the coal, iron, and railroad industries of the South; was colonel in Confederate quartermaster's department; was a member of Methodist Episcopal Church South, director in its book concern and president of its missionary society; founded the Tennessee Industrial School, erecting an auditorium which alone cost \$10,000.
- COLLETT, JOHN, geologist, Indianapolis, March 15; born in Indiana, 1828; graduated at Wabash College, 1847; in 1870 elected to State senate and served three sessions; 1878, statehouse commissioner, and 1879, chief of the bureau of statistics and geology.
- COMINGS, BENJAMIN NEWTON, December 4, New Britain, Conn.; born November 2, 1816, Cornish, N. H. Fitted at Kimball Union Academy; graduated at Dartmouth College, 1842; after graduating he taught in Watertown and Lansingburg, N. Y.; received his M. D. at Castleton Medical College, Vermont, 1847; practiced in Troy, N. Y., Rockwell and New Britain, Conn.; was professor of physiology and chemistry in Connecticut State Normal School, 1853; chairman of board of health of New Britain for twelve years; medical examiner for the coroner twelve years; chairman of the school board ten years;

president of the city, county, and State medical societies; surgeon Thirteenth Connecticut Volunteers, 1861; by General Butler's orders was detached and set about the sanitary reformation of New Orleans. He wrote a text-book of physiology and lectured on that subject and on temperance, having made a special study of the effect of alcohol on the brain.

CONANT, CHESTER COOK, November 6, Greenfield, Mass.; born September 4, 1831, Lyme, N. H. Graduated at Dartmouth 1857; Albany Law School in 1859. Register of probate of Franklin County, Mass., 1863-1870, when he became judge of probate: served long on the school commission of Greenfield and as secretary of the literary association.

CONANT, MRS. HELEN STEVENS, author, in Brooklyn, N. Y., April 17; born Methuen, Mass., October 9, 1839; married Samuel Stillwell Conant, editor of Harper's Weekly, and assisted in his editorial work; wrote "Butterfly hunters" for children 1868, "German Primer" 1878, "Spanish Primer" 1879.

COOK, WILLIAM H., M. D., in Chicago, Ill., April 14; born in New York City in 1832; 1852, professor of chemistry in Syracuse, N. Y.; 1854-1884, dean of the Medical Industrial Commission; 1891, until his death, was president of Medical College of Surgery, Chicago, and editor of Medical Observer; was author of many medical treatises. Three of his sons became college professors.

COOPER, MRS. ADA AUGUSTA, composer, in Orange, N. J., September 18; born in Brooklyn, N. Y., 1861; graduated from Shaw University, Raleigh, N. C., where she taught several years, later in Washington, D. C.; assisted her husband in lecturing; composed many hymns, anthems, and carols. Her children's Easter day service was especially noted.

COOPER, MRS. SARAH BROWN (née Ingersoll, cousin of Robert J.), in San Francisco, Cal., December 10; born in Cazenovia, N. Y., December 12, 1835; graduated at Cazenovia and studied music and modern languages at Troy Female Seminary; going thence as governess in the family of Hon. George Schley, of Augusta, Ga. One year later she was married to Halsey Cooper, a native of New York, and formerly a teacher at Cazenovia. Mrs. Cooper ably assisted her husband as editor of the Advertiser, in Chattanooga, Tenn., until the secession of the State in 1861, when they sought refuge within Federal lines. Subsequently Mr. Cooper returned to Memphis as United States assessor, and here Mrs. Cooper became widely known for her devotion to church and philanthropic work. She was president of an association for the relief of white refugees and sought to aid all suffering, whether of citizens, soldiers, or freedmen. In 1869 the family removed to San Francisco, where Mrs. Cooper found a wide field for the exercise of her rare qualities of intellect and heart. She was a wise philanthropist; a clear thinker, well informed along many lines; a popular and effective writer and speaker. In his first official visit to the Pacific coast in 1871, in his efforts to gain from that remote section full details of education, the Commissioner of Education, who had known Mrs. Cooper in Memphis, secured her efficient services, which are duly noted in reports. Miss Emma Marwedel, who had been aided by him in going to California and establishing a kindergarten, had trained Miss Smith, afterwards Mrs. Wiggins, and now Mrs. Briggs, a well-known authoress and kindergartner, who founded and conducted the Silver Street Kindergarten in San Francisco. Mrs. Cooper, in her work for the Bureau, visited this kindergarten and duly reported it. She became so deeply impressed with its fitness to save hoodlums that she wrote a series of articles for the public press. The public had learned to respond to her philanthropic movements, her Bible class of 300 leading the way. The result was the organization of the Golden Gate Kindergarten Association, in whose work the most eminent philan-

thropists felt it an honor to share. Mrs. George Hearst established three kindergartens and Mrs. Leland Stanford seven. Mrs. Cooper became president and superintendent of the work, but received no remuneration. Her daughter, Harriet, was deputy superintendent, with but moderate compensation. For seventeen years Mrs. Cooper's full annual reports told the story in eloquent language. The association became an effective propaganda, reaching regions near and remote, even the islands of the sea. The annual collections for expenses were large, but an endowment of \$400,000 was secured. The annual attendance of pupils was about 4,000, and altogether over 20,000 children passed under Mrs. Cooper's direction. The training school, with Miss Anna M. Stovall at its head—the crowning of this work—is still one of its most efficient features.

- COREY, CHARLES HENRY, D. D., educator; Seabrook, N. H., September 5; born in New Canaan, New Brunswick, Canada, December 12, 1834; graduated Arcadia College, Nova Scotia, 1858, Milton (Mass.) Theological Seminary, 1861; entered service United States Christian Commission 1864; became teacher of freedmen; organized schools and churches; 1867, principal, Augusta (Ga.) Institute; in following year became president of Richmond (Va.) Theological Seminary; wrote "Thirty years' labor among the colored people."
- COUES, ELLIOTT, A. M., Ph. D., Baltimore, Md., December 25; born in Portsmouth, N. H., 1842; graduated Columbian University 1861, and its medical department 1863; professor Norwich University, Vermont, 1869; 1873-1876, surgeon and naturalist to the United States Northern Boundary Commission and Smithsonian collaborator; associated also with the geographical survey of the Territories; 1877-1887, professor Columbian Medical College; 1888, professor Virginia Medical College; was a member of fifty scientific societies; was elected to National Academy of Sciences in 1877; chairman of the Physical Science Congress in Chicago at the time of the Columbian Exposition; was editor of numerous bulletins; contributor to Standard Natural History and Century Dictionary; author of some 1,000 monographs, including "Key to North American birds" (1876); "Field ornithology," 1874; "Birds of Northwest," 1874; "Fur-bearing animals," 1877; joint author with J. A. Allen, "Monographs North American rodentia;" "Birds of the Colorado Valley," 1878; "Can matter think," 1886; "Handbook of field and general ornithology," 1893, and many other books.
- CRACRAFT, Rev. JOHN WESLEY, in Saratoga, N. Y., October 31; born in Cleveland, Ohio, 1827. Graduated at Theological Seminary, Gambier, Ohio, 1849; rector of Kenyon College; author of "Judaizing the teachers," "Great Principles," and other books.
- CRAFTS, JOHN J., professor, August 30, 1898; born in Hartwick, N. Y., December 29, 1811. Long a teacher of the classics at Hartwick and Cooperstown, N. Y.
- CRARY, Mrs. HORACE H., benefactor, in Denver, Colo., July 7; born in Liberty, N. Y., August, 1833; noted for her charities and for the erection of Crary Hall, an industrial school in Tennessee.
- CUTCHEON, SULLIVAN M., in Detroit, Mich., April 18; born October 4, 1833, Pembroke, N. H. Fitted at Pembroke Academy; graduated Dartmouth, 1856; teacher, Ypsilanti, Mich., 1858-1860; superintendent of schools, Springfield, Ill., 1858-1860; studied law; admitted to the bar 1860; practiced in Ypsilanti 1860-1875, and in Detroit 1875-1900; member of the Michigan house of representatives 1860-1864; was speaker 1867-1869; national-bank examiner 1865-1872; president of the committee for revision of State constitution 1873; United States district attorney 1877-1885; also served on commission to secure uniformity of State laws. Was trustee of Olivet College; president of trustees

of Harper Hospital; of Dime Savings Bank, Detroit; of the Ypsilanti Savings Bank; of the J. E. Potts Salt and Lumber Company; of the Moore Lumber Company; also treasurer of the Moore & Whipple Lumber Company.

DABNEY, WALTER DAVID, in Charlottesville, Va., March 12; born in Albemarle County, Va., in 1853; graduate of law school of University of Virginia, 1875; was elected to the Virginia legislature; served four years; was a member of debt commission; also of committees on railroads and internal improvements and on finance; prepared manuscript of governmental regulation of railroads (1889), became legal secretary to Interstate Commerce Commission, 1890. In 1892 was appointed by Judge Gresham, solicitor of State Department. In 1895 left the State Department to take the chair of common and statute law in University of Virginia.

DALY, CHARLES PATRICK, jurist, in North Haven, near Sag Harbor, Long Island, September 19; born in New York City, October 31, 1816. Was admitted to the bar in 1839; in 1844 appointed judge of common pleas and remained in office forty-two years. During this period he rendered many important decisions, becoming famous as attorney and judge. Was for a long period president of the American Geographical Society and author of many valuable books.

DARCHE, Miss LOUISE, educator, in London, England, June 1; born in Ontario, Canada, 1864; graduated from Bellevue Training School for Nurses in New York City; 1888 was appointed superintendent of training school for nurses on Blackwells Island; was a woman of great energy and executive ability, and considered one of the best trained nurses in the country.

DAVIS, GEORGE ROYAL, director general of the World's Columbian Exposition, 1890-1894; died in Chicago, Ill., November 25; born in Palmer, Mass., June 3, 1840. He fitted for college at Williston Seminary; enlisted in the Eighth Massachusetts Volunteers in 1861; served through the civil war; became captain of the Eighth Massachusetts and major of the Third Rhode Island Cavalry; served through the Indian campaigns of 1868-69. In 1871 was in business in Chicago; was elected to Congress in 1876 and served three terms. As director-general of the Columbian Exposition he promoted the interests in many ways of the educational features of the exposition.

DENISE, JACOB CONOVER, at Omaha, January 20. Received his medical degree from the Jefferson Medical College; in 1861-1863 was appointed assistant surgeon of the Twenty-seventh Ohio Volunteer Infantry; appointed surgeon of same regiment 1863-64; appointed acting surgeon, United States Army, 1864-65; was chief medical officer of Ohio State Soldiers' Home; for twenty-five years physician at State Deaf and Dumb Institute; was appointed surgeon for United States Pension Office, 1874; was one of the originators of the Omaha Medical College, where he was lecturer on ophthalmology and also dean of the faculty.

DICKINSON, W. C., in Evanston, Ill., March 12; born in Massachusetts, January 26, 1827; fitted for college at Auburn Academy, New York; graduated at Bowdoin, 1848; taught next year at Monson Academy; was tutor in Amherst College, 1851-52; was two years in Union Theological Seminary and graduated from Andover Seminary in 1853; was professor of languages in Lake Forest University.

DIKE, SAMUEL FULLER, January 9; born at North Bridgewater, Mass.; fitted for college in same town; graduated at Brown University, 1838; taught several months at Yarmouth, Mass.; became pastor of the New Jerusalem Church, Philadelphia, June 7, 1840; for twenty years was superintendent of schools at Bath, Me.; for twelve years was trustee of Maine State College of Agriculture and Mechanic Arts at Orono, and was also for a number of years member of

examining committee, Bowdoin College; received the degree of D. D. from Bowdoin in 1872; was prominent in the councils of the Maine Historical Society and was for some time its president.

DINGLEY, NELSON, LL. D., in Washington, D. C., January 13; born in Durham, Me., February 15, 1832; spent his boyhood on his father's farm; graduated at Dartmouth, 1855, having prepared in the district and high schools and studied at Waterville eighteen months; began to teach when 17 years of age and continued each winter until 1851. In 1852 he began the study of law at Auburn, whither he had moved with his family, and was admitted to the bar in 1856, when he became editor of the *Lewiston Journal*, which position he retained until his death. In 1881 he was elected to the National House of Representatives (to succeed Hon. William P. Frye, who had been elected to the Senate), and was reelected to succeed himself until his death. He served with distinction on the Committees of Banking and Currency and the Merchant Marine, and served as chairman of the latter and of the Ways and Means Committee. He was a conspicuous advocate of Christian temperance and of all measures seeking the elevation of the people; was watchful for the interests of the Bureau of Education; served as a member of the Joint High Commission over the questions between Canada and the United States. His death was deeply felt throughout the country.

DOUGLAS, WILLIAM KIRTLAND, in St. Francisville, La., December 19, 1898; born in New Haven, Conn., May 29, 1829; graduated from Yale in 1851; began the study of law while teaching in New Haven; gave up the law to enter Episcopal Church; studied theology while doing work among mill operators at Thompsonville, Conn.; became rector of St. John's Church in Warehouse Point, Conn.; in 1855 his health failed and he removed to Waterproof, La., where he organized a church; 1860-1863, president of Jefferson College, near Natchez, Miss.; was superintendent of schools in Natchez; had charge of Raymond Seminary, Miss.; 1871, organized at Dry Grove, Hinds County, a training school for candidates for the ministry.

DUGGAN, JAMES, bishop, in St. Louis, Mo., March 29; born in Dublin, Ireland, 1825; in 1847 was ordained and appointed superior of the St. Louis Theological Seminary, in which he was also a professor.

DUNGAN, JOHN, in Portsmouth, December 13; born in Strafford, N. H., March 26, 1814; taught school in Barrington, N. H., and in New Castle. Taught school in Portsmouth, 1845-1872, during which time he was absent from his post two weeks only, and this on account of illness.

DUNTON, LARKIN, LL. D., educator, in Allston, Mass., October 30; born in Concord, Me., July 22, 1828; graduated at Waterville College, 1855; was admitted to the bar, Augusta, Me., but soon retired from the practice of law and was called to teach at Bath, Hallowell and Lincoln Academy, and for seven years was principal of Bath High School; April 1, 1867, was appointed submaster of Lawrence School, Boston, and the next year was made principal. In 1872 he was chosen master of normal school in that city and so continued until he retired September 1, 1899. He edited a memorial volume of Dr. John D. Philbrick, and published several books: *A Normal Course in Spelling*, *Stories of Child Life*, *The World and its People*, *Series of Geographical Readings*, and *The Young Folks Library*. He gave shape to the normal training of the city system.

EATON, DORMAN B., in New York City, December; born in Hardwick, Vt., June 27, 1823; graduated from the University of Vermont in 1848 and from Harvard Law School in 1850, and same year was admitted to the New York bar and

became partner of Judge William Kent; gave his active life to the great work of political reform, for which he was violently assailed; studied the subject of civil service in Europe, 1866, and again in 1870-1873; was appointed by President Grant chairman of the first Civil Service Commission and served until Congress in 1882 failed to appropriate money for it: President Arthur appointed him again chairman under the Pendleton act of 1883, and he continued to serve until 1885, when he resigned; three months later was recommissioned by President Cleveland. He suggested to President Hayes that the story of England's experience ought to be published for the benefit of the American people. There being no appropriation for such a work, Mr. Eaton assumed the expenses, and after another visit to Europe to freshen his information he published his book, *Civil Service in Great Britain and its Bearing on American Politics*, which did much to educate the public mind on the subject of civil service reform. He delivered many addresses and wrote many articles on the subject. The first civil service reform association was organized at his house in 1874. He is understood to have drawn the Pendleton act. He was an excellent lawyer and independent in politics.

EDWARDS, REV. HENRY, in Hagerstown, Md., February 25; born in New Haven, Conn., December 31, 1821; graduated at Yale, 1841; graduated at General Theological Seminary; was director in various places and taught for three years in Cumberland, Md., and later taught a select school at his residence. He was highly esteemed even by those who differed with him.

ELBERT, SAMUEL H., LL. D., in Galveston, Tex., November 27; born in Logan County, Ohio, 1833; graduated Wesleyan University; supported Mr. Lincoln; was member of Nebraska legislature; appointed secretary of the Territory of Colorado and later governor; later devoted his attention to the interests of irrigation and education; was judge.

ELWELL, JAMES WILLIAM, philanthropist, New York, September 2; born in Bath, Me., August 27, 1820; became merchant and partner with his father in New York. His benefactions are believed to have amounted to over \$3,000,000.

ERNSBERGER, MRS. MARY ANNIN, missionary, in Gulbarga, India, September 30; born in Newark, N. J., February 18, 1864; was daughter of Rev. George Hughes; graduated Mount Holyoke Seminary, 1886; became missionary to Madras, and with her husband founded the Madras orphanages.

ETHERIDGE, JAMES, M. D., gynecologist, in Chicago, February 10; born St. Johnsville, N. Y., March 20, 1844; was professor of gynecology at Rush Medical College, and became president, respectively, of the medical society and of the gynecological society.

EUSTIS, JAMES B., diplomat, in Newport, R. I., September 9; born New Orleans August 27, 1834; educated in Brookline, Mass., and Harvard Law School; practiced law; Confederate staff officer; after the war served in the State legislature. In 1876, elected United States Senator for an unexpired term; was a professor of civil law in the University of Louisiana, until 1884, when he was again sent to the United States Senate; was a member of the Committee on Foreign Relations. In March, 1893, he was appointed minister to France; had charge of the Consul Waller case; practiced law in New York; translated the Institutes of Justinian and Guizot's History of Civilization.

FAIRBAIRN, ROBERT BRINCKERHOFF, D. D., LL. D., educator, in Brooklyn, N. Y., January 27; born in New York City, May 27, 1818; graduated at Washington, afterwards Trinity College, Hartford, Conn., 1840; studied at General Theological Seminary, New York City, and became a rector of a church in Troy, N. Y.; 1853 became principal of Catskill Academy; ten years later, professor of mathematics in St. Stephen's College, Annandale, N. Y., where he was

subsequently president twenty-eight years. He raised the institution from a primary school to a high grade with a property worth \$500,000, and retired in 1891. He was the author of several books.

FANCHER, BELA, in Homer, Mich., November 29; born at Verona, Oneida County, N. Y., June 11, 1807; graduated at Middlebury College, 1831; at Andover Theological Seminary, 1835, teaching an intermediate year at Sheldon Academy, Southampton, Mass.; went from Andover under the direction of the Home Missionary Society to Ohio, and was located six years at Troy, in that State; was at North Bergen, N. Y., six years and at Oakland, N. Y., six years; was for two years principal of Carey Collegiate Institute, Oakland. Subsequently removed to Barre, Vt., where he remained until death, engaged either as pastor, principal of an academy, or superintendent of schools.

FARNSWORTH, HIRAM WARNER, at Topeka, Kans., July 26; born at Brattleboro, Vt., October 13, 1810; graduated at Williams, 1840; principal of a female academy, New London, Conn., fifteen years. Removed to Topeka, Kans., where he was mayor, State senator, and postmaster.

FARRAND, HARRIET AUGUSTA, authoress, in Chicago, Ill., May 19; born in Bridport, Vt., June 7, 1832; removed to Ypsilanti, Mich., where she graduated from the normal school, 1857. She became known as the author of short stories while acting as associate editor of the *Advance*. She also wrote books for children.

FARN, JOHN WALKER, at Hot Springs, Va., April 8; born in Huntsville, Ala., January 13, 1832; graduated at Yale, 1851; admitted to the bar in Mobile in 1854; became secretary of United States legation, Brussels, and in 1856-1858 held the same position in Mexico; rendered the Confederacy diplomatic and staff service, and after the war became professor in the University of Louisiana; in 1885 minister to Greece; in 1891 chief of the department of foreign affairs at the Columbian Exposition, Chicago, Ill.

FIELD, STEPHEN JUDSON, LL. D., jurist, in Washington, D. C., April 9; born in Haddam, Conn., November 4, 1816; was grandson of Capt. Timothy Field, of the Revolutionary army; son of the Rev. Dr. D. D. Field, and brother of David Dudley, Cyrus West, and Henry Martyn Field; at 13 went with his sister and her husband, Rev. Josiah Brewer, to Smyrna, where he learned the Greek, Turkish, French, and Italian languages; shared in relief work during the cholera epidemic; graduated at Williams in 1837; admitted to the bar in 1841. In 1863 Mr. Lincoln appointed him justice of the Supreme Court of the United States. In April, 1897, he tendered his resignation, to take effect December 1, following; he was at the time the oldest member of the court, both in age and length of service, having held the office for over thirty-four years.

FLOWER, ROSWELL P., LL. D., banker and philanthropist, in Eastport, Long Island, N. Y., May 12; born in Jefferson County, N. Y., August 7, 1835; worked at farming and in mill, attending district school until the age of 14, when he became a clerk in a local store; at 16 graduated from high school and spent two years in teaching. Was elected to Congress several terms and was governor of New York. Made generous gifts to charity and education.

FORD, DANIEL SHARP, publisher, in Boston, December 24; born in Cambridge, Mass., April 5, 1822; learned the printer's trade and was at one time a member of the firm of Olmstead & Ford, publishers and editors of the *Baptist Weekly*, then known as the *Christian Watchman and Reflector*. In 1857 the firm bought the *Youths' Companion*, of which Mr. Ford became the only owner, using as a firm name, "Perry, Mason & Co." His editorial and business supervision was constant and vigorous, but his name was not published. His charities were quiet, but most extensive.

- FOSTER, CASSIUS G., jurist and philanthropist, Topeka, Kans., June 21; born in Webster, N. Y., January 22, 1837; admitted to the bar 1859 and settled in Atchison, Kans; 1863 served in the State senate; mayor of the city, and from March, 1874, to 1899 was United States judge for the district of Kansas. Founded the well-known Foster Humane Society.
- FURBECK, REV. PHILIP, at St. Johnsville, N. Y., July 23; born in Guilderland, N. Y., December 29, 1832; graduated at Union College in 1854; was principal of the Troy Academy for a year, then professor in Schoharie Academy three years; afterwards devoted himself to the ministry.
- FURBER, REV. DANIEL L., LL. D., in November 20; born Sandwich, N. H., 1820; graduated Dartmouth, 1843; gained the means for his education by teaching music; graduated at Andover Theological Seminary, 1847; was joint author with Professors Phelps and Park of Hymns and Choirs, and issued various other publications.
- GALBREATH, LOUIS H., in New York City August 14; graduated at the State normal school in Normal, Ill.; later graduated at Cornell University, also pursued graduate work at Cornell and spent a third year at Columbia preparing for his Ph. D. degree. In 1893 was appointed principal of the training department of the State normal school, Winona, Minn. Held this position three years, then accepted chair of psychology and education at Normal, Ill.; in 1897 occupied the chair of psychology and child study at Teacher's College of Buffalo University; in March, 1899, was elected principal of the training department of the new State normal school at Charleston, Ill.
- GARDNER, SAMUEL SPRING, in Washington, D. C., March 2; born January 9, 1831, at Cambridgeport, Mass.; prepared for college at Phillips Academy, Andover, Mass.; graduated from Bowdoin, 1855; was principal of Bluehill Academy two years, and taught history and literature in Mount Pleasant Military Institute, Sing Sing, N. Y.; studied theology and graduated from Bangor Seminary, 1861; was pastor at Bellows Falls, Vt., 1864-1872; was chaplain United States colored infantry. At close of war was superintendent of freedmen's affairs, Alabama. Studied law, was admitted to the bar, and became member of the constitutional convention, 1867.

SAMUEL, in Litchfield, Conn., June 25; born in East Machias, Me., June 14, 1814; graduated at Bowdoin College, 1833; Andover Seminary, 1836, engaged in teaching until 1839; was pastor at Conway and Pittsfield, Mass., 1855; for twenty-two years was professor in Bangor Seminary; 1867-1871, president of Bowdoin College; 1871-1895, professor of theology at Yale Divinity School.
- HART, LEVI WELLS, in Ramsey, N. J., February 22; born in New Britain, Conn., June 7, 1825; graduated at Yale, 1846, and at Union Theological Seminary, 1852; and in 1853 became rector of the College Grammar School, New York, and so continued until a week before his death, when he became professor in Pratt Institute.
- HARTLEY, REV. ISAAC SMITHSON, D. D., in Great Barrington, Mass., July 22; born in New York City, 1830; graduated New York University and Andover Seminary, 1856; active in sanitary commission; pastor and lecturer, Utica, N. Y., 1871; founder of Vetter lectureship at Rutgers College, New Brunswick; published several books.

- HARTWELL, SHATTUCK, in Boston, November 3; born in Littleton, Mass., February 9, 1822; graduated at Harvard College, 1844; law school, 1846; tutor in Latin at Harvard six years.
- HAYLEY, HERMAN WADSWORTH, educator, in Boston, Mass., September 24; born in West Concord, N. H., 1864; graduated at Amherst, 1887; continued his studies abroad and received Ph. D. from Harvard, where he was retained as instructor in Latin, when he became member of the faculty of Wesleyan University. He published "Alcestis of Euripides," a Greek play, and other works.
- HAYNES, REV. LORENZO, in Waltham, Mass., June 6; born in Waltham, April 15, 1820; taught in Lonsdale, R. I., Leicester, and Lowell, Mass., and Rochester, N. Y.; served six years as librarian at Waltham, Mass.; held pastorates in several churches in Maine and Massachusetts.
- HAZELTINE, REV. HENRY MARTYN, Jamestown, N. Y., March 15; born there August 28, 1831; graduated at Williams, 1852; taught in Cherry Valley and Jamestown, N. Y., and eastern Pennsylvania, and New Brunswick, N. J., studied theology at Union Seminary, New York, and served as pastor in a number of churches until his health failed.
- HEIN, JOHN, philanthropist, New York City, June; born in Kissingen, Bavaria, March 11, 1818; was a cripple almost from birth, and in constant pain; learned the tinsmith's trade and accumulated an estate of \$60,000; gave German hospitals \$45,000 and bequeathed to them the remainder of his property. Always on the alert to relieve suffering.
- HILL, OSMOND C., in Kansas, June; born in Cuyahoga County, Ohio, December 31, 1839; graduated at Williams, 1876; soldier, Forty-second Ohio; teacher, Columbus, Ohio; two years professor at Oberlin; eight years at Hiram College. After graduation established Normal School, Oregon, Mo. In 1883 he resigned to become superintendent of schools at Hiawatha, Kans., where he served five years.
- HOPKINS, ABEL G., Ph. D., D. D., educator, in Clinton, N. Y., July 27; born in Avon Springs, N. Y., December 5, 1844; graduated at Hamilton College, 1866, at Auburn Theological Seminary, 1869; was a popular pulpit orator; was professor in Hamilton College from 1869 until his death.
- HOUSE, SAMUEL R., in Waterford, N. Y., August 13; born at Waterford, N. Y., October 16, 1817; graduated at the Troy Polytechnic Institute and took a degree at Dartmouth; entered Union College as junior and graduated with honor; taught in an academy in Virginia; was principal of Weston Academy, Connecticut; graduated in 1845 from New York College of Physicians and Surgeons; while editing Knickerbocker Magazine was appointed missionary physician in Siam; worked heroically through two fearful pestilences in Bangkok; wrote much on medicine and missions.
- HOVEY, RICHARD, poet, in New York City, February 24; born in Normal, Ill., May 4, 1864, where his father, Gen. Charles E. Hovey, was principal of the normal university before he entered the Army; graduated at Dartmouth College, 1885. His poetical promise appeared before graduation. After graduation, before his course of life was fixed, he entered upon the study of theology. Subsequently he went to England, and while abroad became deeply interested in contemporary French and Belgian poets and published a translation of Maeterlinck. Thenceforth he gave himself up to literature and soon gained distinction both as a poet and critic. In 1889 he was appointed professor of English at Barnard College, which position he held until his death. He was associated with Bliss Carman in the authorship of Vaga-

bondia, and later also with him in *More Songs from Vagabondia*, and also *Last Songs from Vagabondia*. His published works comprise *The Laurel*, *Launcelot and Guinevere*, *Seaward*, an elegy on the poet Parsons, *Along the Trail*, *The Quest of Merlin*, *The Marriage of Guinevere*, *The Birth of Galahad*, and *Taliesin*, which last is considered his most finished effort. By his death Stedman says, "America has lost one of her best-equipped lyrical and dramatic singers."

HOWARD, ABEL TRUMAN, February 25; born November 1, 1830, at West Hartford, Vt.; graduated from Dartmouth, 1861; was principal of high school at Walpole, N. H., until 1865.

HOWELL, GEORGE ROGERS, in Southampton, L. I., June; born in the year 1833; graduated from Dartmouth, 1854; graduate of Princeton Seminary; was pastor a year and a half of Presbyterian Church, Moscow, N. Y.; wrote a volume on *Early History of Southampton*, with genealogies, issued in 1866; 1869-1872, principal of a boys' school, Mount Morris, N. Y.

HUBBARD, Prof. ELI ANDREWS, in Holyoke, Mass., August 8; born in Hinsdale, Mass., December 11, 1814; graduate of Williams College, 1842; taught one year in the academy at Worthington, Mass.; one year was tutor in college; taught two years at Lee and one year at Northampton; was connected also with Williston Seminary, East Hampton; in 1865 was superintendent Springfield public schools; 1875-1882 was agent of State board of education; later he became identified with the educational work in D. L. Moody's school at Mount Hermon.

HUNTER, Rev. MOSES HOGE, in La Plata, Md., January 9; born Martinsburg, Va., October 5, 1814; graduate of Yale, 1836; studied theology in Princeton Seminary and Yale Divinity School; was ordained to the ministry, 1840; 1847 established a boarding school for boys on Grosse Isle, Mich., which he maintained until the beginning of the civil war; was chaplain of the Third Pennsylvania Cavalry; taught in a girls' boarding school at Washington, D. C., 1878.

HYDE, Rev. CHARLES McEWEN, in Honolulu, October 5; born in New York City, June 8, 1832; graduate of Williams, 1852; studied theology at Union and Princeton; was ordained 1862; was pastor Goshen, Conn., Brimfield, Mass., and Haverhill, Mass. In 1875 the prudential committee of the American board sent him to Hawaii to take up missionary work there. In 1877 he organized the North Pacific Missionary Institute, of which for twenty-two years he was principal; was trustee for several educational institutions on the island; was one of the three men to whom was intrusted the care and distribution of the large fortune left by Mrs. Bishop for the Kamehameha schools. He wrote a history of Brimfield and the town of Lee. He also wrote, with President Bartlett, of Dartmouth College, an extended account of the work of the Hawaiian mission.

JACOBS, SAMUEL ALLEN, in Dudley, Mass., April 12, 1899; born in Dudley, Mass., February 4, 1869; graduate of Amherst, 1891. Taught in Iowa City Academy 1892-93; in Highland Military Academy, Worcester, Mass., 1893-94. In 1894 was appointed principal of the high school and superintendent of schools at Stafford Springs, Conn., and continued in that position until his death.

JENNINGS, ROSCOE GREEN, M. D., Ph. D., at Little Rock, April 5; born June 11, 1833, at Leeds, England; graduated in medicine, Bowdoin, 1856; was one of the founders of the medical department of the Arkansas Industrial University; surgeon in Union Army; for many years professor in Western University of Pennsylvania; principal of high school in Pittsburg, and wrote on subjects of geology.

JOHNSON, ELLEN CHENEY, in London, England, where she was to have read a paper before the International Council of Women as an American representative. She was born in Athol, Mass., June 20, 1819, the daughter of Nathan and Rhoda Cheney, and was the widow of J. E. Johnson. She obtained her training in the common schools of New Hampshire and in Francestown Academy. During the civil war she engaged in soldiers' relief work in the Sanitary Commission, and after the war did much for soldiers' widows and orphans, and while in the work became impressed with the need of a separate correctional institution for women. Her studies and experiences enabled her to master with special success the motives, conditions, and methods by which women in misfortune from any cause may be restored to normal activity. Her ideas were approved and the public responded to her appeals. The Woman's Prison at Sherborn was the result. She served on the board of prison commissioners, but was appointed superintendent in May, 1884, and continued to improve and enlarge the prison until her death, rendering Sherborn a study for all penologists.

JOHNSTON, WILLIAM PRESTON, in Lexington, Va., July 16; born in Louisville, Ky., January 5, 1831; graduate of Yale, 1852, and at Louisville Law School, 1853; served as colonel and aid to Jefferson Davis in the Confederacy; was professor of history and literature at Washington and Lee University, 1866-1877, and president of Louisiana State University, 1880-1883; became president Tulane University, New Orleans, and so continued until his death. He published the life of his father, Gen. Albert Sydney Johnston, and several other works of merit.

KAPIOLANI, dowager Queen of Hawaii, in Honolulu June 24; born in Honolulu, December 31, 1831; was descended from a long line of chiefs on the island and was granddaughter of the last king of the island; was devoted to charitable work and founded the Kapiolani Home for Leper Girls.

KEENER, JOHN ORMON, D. D., in Greensboro, Ala., December 31, 1898; born in New Orleans, August 17, 1854; graduate of Southern University, Greensboro, Ala., 1874; 1894, was elected president of his alma mater; was a member of the last ecumenical conference of Methodism.

KELLOGG, SAMUEL HENRY, in Lahore, India, May 2; born Quogue, Long Island, N. Y., September 6, 1839; graduate of Princeton, 1861, and also graduate of Princeton Seminary; was sent to India by the Presbyterian board; 1865-1872, was stationed at Futteghur, and 1872-1876 at Allahabad, where he taught theology in a synodical school; returned to the United States in 1877 and became pastor of Third Presbyterian Church in Pittsburg, Pa., and professor in Western Theological Seminary; 1876-1892, was pastor St. James Square Presbyterian Church, Toronto, Canada; returned as missionary to India, 1892, and applied himself to translating the Bible into Indian language; was author of a number of books; was killed by being thrown over a precipice while making a tour of the Himalaya Mountains on his wheel.

KEMPER, DELAWARE, A. M., in Alexandria, Va., June 30; born in Warrenton, Va., August 25, 1833; was educated at the University of Pennsylvania; entered the Confederate army in 1861; after the war became professor in Hampden-Sidney College, where he remained for seventeen years, when he became professor of Citadel Academy, Charleston, S. C., and later president of Adger College, South Carolina; was consul at Amoy, China, and on returning took charge of the Alexandria Times.

KENDALL, EZRA OTIS, LL. D., educator in Philadelphia, Pa., January 5; born in Wilmington, Mass., May 5, 1816; received his early education at Woburn, studied with his half brother, Sears C. Walker, a noted mathematician, and

was appointed professor of theoretical astronomy and mathematics in the high school of that city in 1838. He organized and equipped an astronomical observatory, in which he made constant study of the heavens for many years.

**KIES, Miss MARIETTA, Ph. D.,** Pueblo, Colo., July 20; born December 31, 1853, at Killingly, Conn. She secured an education by great effort, her studies being interrupted by work in a factory and sometimes by teaching to earn money. She was both teacher and pupil in the high school at Danielson, to whose principal, Mr. Sidney B. Frost, she was specially indebted. In 1878 she entered Mount Holyoke Seminary, but was compelled to teach a portion of the time, and completed the course in two years, teaching there immediately after her graduation. In 1882-83 she taught at Putnam, Conn., and later at Colorado College, Colorado, returning to Mount Holyoke in 1885, where she was professor for six years and a portion of the time principal. During this period she was able to avail herself of the private and friendly instruction of Dr. W. T. Harris. Her interest in his instruction induced her to gather from his scattered writings extracts which were published under the title "Introduction to the study of philosophy." She was the first woman to receive the degree of Ph. D. from the University of Michigan. In 1890-1892 she was professor at Mills College, Oakland, Cal. Her university thesis, under the title of "The ethical principle," was published. In 1892-93 she studied at Leipzig and Zurich. She then taught the high school at Plymouth, Mass., where she published her *Institutional Ethics*. She was then professor for three years in Butler College of Indiana. She was a lady of attractive appearance, culture, and fine scholarly attainments.

**KRAUS, Prof. JOHN, in New York City, March 4, 1899;** born in Nassau, Germany, February 2, 1815; studied in the common schools of his birthplace and at Idstein. He early mastered the principles and methods of Froebel's Kindergarten. In 1851 he came to America, where he struggled against many obstacles to realize his educational ideals. In 1870 he was employed by the Bureau of Education at a mere nominal compensation. Here he was ever on the alert to bring to the attention of the Commissioner whatever in the tide of information coming to the Bureau might bear upon the desirableness of kindergartens in America. Chiefly through his services the Bureau became a center of information and of advice in respect to this work. Professor Kraus subsequently married Miss Maria Boelte, a pupil of Froebel, who had established a kindergarten in New York. He joined in the work, and their training school became justly celebrated. Since his death the Kraus Alumni Kindergarten Association has been organized to cherish his memory and to promote the interest of Kraus Seminary.

**LALOR, JOHN J., author, in Washington, D. C., June 10.** Taught in high school in Milwaukee, 1885; later went into the publishing business; translated various works from French and German, and was employed as a translator in the office of the Director of the Mint, Washington, D. C. He edited a cyclopedia of political science, political economy, and political history of the United States, and was the author of many other works.

**LOCKWOOD, HENRY HAYES, educator and soldier, in Washington, D. C., December 7;** born in Kent County, Del., August 17, 1814; graduate of West Point 1836; was assigned to the artillery and took part in the Florida war against the Indians; resigned and became farmer; 1841 professor in United States Navy; took part in capture of Monterey; 1842-1845 professor of tactics in Naval Academy; 1845 and 1861 professor of astronomy and gunnery; became brigadier-general and commanded a brigade at Gettysburg. After the war was again professor at the Academy, 1871-1876; served at the Naval Observatory; published a manual for naval service.

- MCALPIN, WILLIAM, June 2; born in Cincinnati, Ohio, January 20, 1839; graduated at Yale 1860; was engaged in business the greater part of his life; devoted much time to Sunday-school work and to the Young Men's Christian Association; was much interested in music, and became president of the College of Music until his death; was trustee of the University of Cincinnati from 1892 till his death.
- MCCRACKEN, REV. CLARKE L., died the 29th of June; born in Kortright, N. Y., January 28, 1828; graduated at Union 1869; studied theology, became pastor at different places, and in 1893, till his death, president of the Normal Institute at Henderson, N. C., where he at times had care of 700 pupils of both sexes; he emphasized manual training.
- MCEENROE, WILLIAM HALL, died in New York May 17; born at Charlottesville, Va., August 15, 1854; graduated at the University Medical College in 1882; member of staff of Billerica Hospital, and for thirteen years taught in the medical college; published notes; was selected for a chair in Cornell Medical College just before his death.
- McKEE, MRS. MARY A., assisted Dorothea L. Dix most efficiently in care of the soldiers. After Miss Dix secured the charge of erection of New Jersey State Hospital for the insane, Mrs. McKee gave her services to it, and remained there more than thirty years.
- MACY, WILLIAM C., July 4, New York City; born at Hudson, N. Y., November 10, 1832; graduate of Union College 1860; was tutor at Union three years, and eleven years assistant professor of Greek; spent most of his life in teaching, lecturing, and writing for magazines.
- MAGILL, WILLIAM A., in Amherst, Mass., November 22; born in Bryan County, Ga., January 2, 1836; served in the war for the Union; established a boarding school for boys in old Lyme, Conn., also in Newton, N. J., and in New Haven, Conn., where he conducted classes connected with Hopkins Grammar School.
- MAGUIRE, NICHOLAS H., in Philadelphia, Pa., June 29; born in Burlington, N. J., September 21, 1814; was professor in Laurel Hill College, Philadelphia, in 1835; principal of Coates Street School in 1842; 1858-1866 was principal of Central High School; 1870 principal of S. E. Grammar School, where he continued until 1894, when he became supervising principal over all the public schools of the city.
- MARCY, OLIVER, LL. D., educator, in Evanston, Ill.; born in Colerain, Mass., February 13, 1820; graduate of Wesleyan University 1846; was professor of natural history in Northwestern University 1862; 1876-1881 was acting president, and since 1881 has been dean of the faculty; was geologist in 1866 in the Government road service; was fellow of the Royal Geographical Society; published many addresses and essays.
- MARSH, CALEB SPENCER, in Trefiew, North Wales, February 3; born in Bath, Me., January 20, 1830; graduate from Dartmouth 1849, and attended one course of medical lectures; graduated from Andover Seminary in 1855; was licensed to preach and ordained pastor of the First Congregational Church, Burlington, Vt., November 6, 1856, where he remained until 1860; was pastor of Presbyterian Church at Haverstraw, N. Y., 1862-1868; was professor in the University of Vermont 1872; studied and traveled in Europe; was professor of modern languages 1872-1875 in University of Vermont, and was assistant in Congressional Library 1882-1891.
- MARSH, OTHNIEL CHARLES, LL. D., Ph. D., in New Haven, Conn., March 18; born in Lockport, N. Y., October 29, 1831; graduated at Yale 1860, after which for two years studied science in the Sheffield School; was for three

years in Berlin, Heidelberg, and Breslau, studying zoology, mineralogy, and geology; became professor of paleontology at Yale, where he remained until his death. Through his influence with his uncle, George Peabody, the money was secured for the erection of the Peabody Museum, and he became its curator; in 1878 he was president of the American Association for the advancement of science, and from 1883-1895 was president of the National Academy of Science; he received many honors in science; his bibliography contains 237 titles.

MARTIN, THOMAS, in McIndoe Falls, Vt.; born July 12, 1846, at Charlestown, Mass.; graduated at Dartmouth in 1871; was principal of McIndoe Academy for several years; taught also at Bradford Academy, Lyndon Institute, and the Newport High School; was ten years principal of the high school at Barton, Vt., and superintendent of schools in Peacham, Barnett, and Barton, Vt.

MASON, T. B. M., in Saugerties, N. Y., October 15; born in New York City, May 8, 1848; graduate of the U. S. Naval Academy 1868; he organized the office of Naval Intelligence, and brought it to a high state of efficiency; was naval aid to Presidents Grant and Arthur, and to Secretaries Robeson, Whitney, and Tracy.

MEDILL, JOSEPH, journalist, in San Antonio, Tex., March 16; born at St. John, New Brunswick, April 6, 1823. His family emigrated to Massillon, Ohio, and engaged in farming in 1831; while employed on the farm he walked 9 miles on Saturdays to receive instruction; was admitted to the bar in 1846. After two years of practice at New Philadelphia, Ohio, bought the Coshocton Republican, a weekly Whig paper, which he conducted for two years, when he left the law; 1871 he started in Cleveland The Forest City, which he united with The Free Democrat, under the name of The Cleveland Leader; was opposed to the extension of slavery, and one of the 12 men who organized the Republican movement in Cleveland; in 1854-55 he sold out and joined others in establishing the Chicago Tribune. He supported Mr. Lincoln's election, urging the proclamation of emancipation long before issued; urged General Grant for Presidency before nominated; also urged a single term of six years; 1871 was appointed member of the first Civil Service Commission; was elected mayor of Chicago; did much to secure a new charter and the establishment of the public library; aided in the organization of the Chicago Exposition.

MEEK, B. F., LL. D., in Tuscaloosa, Ala., June 16; graduate of the University of Alabama; he occupied the chair of English literature in the University of Alabama for more than thirty years; was offered the same chair at the University of Oxford, England, also the presidency of the University of Virginia, but declined both; preferred to remain with his alma mater.

MERGENTHALER, OTTMAR, inventor of the linotype, in Baltimore, Md., October 28; born in Wertburg, Germany, May 10, 1854; learned the trade of watch-maker, and at the age of 18 came to this country penniless and friendless. The crude machine was tried by the New York Tribune; it became a commercial success by the application of the Rogers spacer.

MILES, WILLIAM PORCHER, in Burnside, La., May 11; born at Charleston, S. C., July, 1822; graduate of Charleston College, and for several years assistant professor; engaged in relief service in a period of yellow fever at Norfolk; returning to Charleston, was elected mayor; elected to Congress 1856, 1858, and 1860; elected to convention adopting the ordinance of secession; was Confederate colonel and member of Confederate congress; in 1880-1882 was president of the College of Agriculture and Mechanic Arts, as the State college was called during that period,

MILLER, HENRY CARLTON, jurist, in New Orleans, La., March 5; born in Covington, La., in 1828; studied law with his father; for several years was professor of international law in Tulane University; for twelve years was associate justice of supreme court of Louisiana.

MILLER, LEWIS, philanthropist, in New York City, February 17; born in Greentown, Ohio, 1829; apprenticed to a machinist; one of the first to produce a successful reaping and binding machine; established a shop for manufacturing agricultural machinery at Canton, Ohio; was a devoted Sunday-school worker; sought the improvement of Sabbath schools; conferred with Bishop John H. Vincent and aided in founding and developing the Chautauqua Assembly. He gave largely of his means for religious and benevolent purposes.

MOODY, DWIGHT L., evangelist and religious educator, died December 22, in Northfield, Mass.; born there February 5, 1837; was left with six brothers and one sister to the care of a widowed mother; attended common school and aided his family; at 17 became clerk in a Boston shoe store, where he remained two years. During this time he joined the Mount Vernon Church, Dr. Kirk, pastor. In 1856 he went to Chicago and became active in Sabbath-school work, gathering a school of over 1,000 pupils, and two years later gave up business entirely to devote himself to Christian work; was in the Christian Commission during the war; became general missionary of the Y. M. C. A. in Chicago, and practically its head in that city; he built a church for his Sabbath school and connected with it a school for workers and foreign missionaries. This church was burned and rebuilt. He twice visited England and aided Ira D. Sankey, the singer; he pursued evangelistic work in York, England, in a quiet way. This work grew rapidly and audiences of 10,000 to 20,000 responded to his appeals in the leading cities. He returned to America in 1875 and continued the same work—holding meetings in most of the leading cities. In Boston a large tabernacle was built for him, costing \$10,000, where meetings were held daily with an attendance of 5,000 to 10,000 for four months. In 1883 he and Mr. Sankey returned to London and conducted evangelical meetings, drawing enormous audiences. In his last visit to Scotland in 1891 he spoke in 99 towns. His brief visit to Palestine may be called his only holiday. He was a tireless worker. In 1879 he opened a small school for poor but promising girls in his region. In 1880 the foundation of the first of the buildings for the schools at Northfield was laid. They numbered in five 50, representing a cost of about a million dollars and accommodating 1,000 pupils. For some twenty years Mr. Moody devoted his summer vacations to these schools and their conferences. He was stricken with paralysis in the midst of meetings in Kansas City, where his audiences numbered thousands. It is said that more than 50,000,000 people have listened to his addresses. He was noted for his singleness of purpose, his undying enthusiasm, his indomitable will, his great common sense, his mastery of men, his great organizing ability, and his wonderful power of speech, together with that mysterious quality which we call personal magnetism. His publications were numerous.

MOORE, CLARA JESSUP, in London, England, January 5; born in Philadelphia, Pa., February 16, 1824; daughter of Augustus E. Jessup, scientist of Major Long's expedition to the Yellowstone, 1816, and was widow of Bloomfield H. Moore, from whom she inherited large wealth; was known as a writer of fiction and poetry under the nom de plume of Mrs. Clara Moreton; established the woman's Pennsylvania branch of United States Sanitary Commission, and later aided in founding the Union Temporary Home in Philadelphia; in 1880 established Bloomfield Moore Art Collection in Franklin Institute; in

1887 made her permanent home in London. From 1881 until his death in 1898 John E. W. Keeley was dependent on her bounty.

MORITA, KUMATO, in Japan, February 23; born in Japan in 1858; graduate of Yale in 1892; taught there, and also ten years in Japan.

MURRAY, JAMES ORMSBY, D. D., LL. D., in Princeton, N. J., March 27; born in Camden, S. C., November 27, 1827; graduated at Yale in 1854; was instructor at Brown University; was pastor for a period; was Holmes professor from 1875; dean of faculty from 1883.

NEWTON, WILLIAM MORRISON, in Provincetown, Mass., January 10; born May 26, 1867, in Truro, Mass.: graduate of Dartmouth, 1889; taught in high school of Watertown and Waltham, and for four years teacher in Charlestown.

ORCUTT, HIRAM, LL. D., in Brookline, Mass., April 17; born in Acworth, N. H., February 1, 1815; graduate of Dartmouth, 1842; was principal of Hebron Academy, N. H., Granville Seminary, N. Y., Glenwood Seminary, West Brattleboro, Vt., of Tilden Seminary, West Lebanon, N. H. In his forty years of teaching he had under his charge over 5,000 students, many of whom he trusted for their expenses and received payment as they earned the money. He was associated in the conduct of the Journal of Education and wrote for it until his death. He was classmate of Dr. John D. Philbrick and teacher of John Eaton. He published several books.

ORMISTON, REV. WILLIAM, D. D., LL. D., near Los Angeles, Cal., March 19; born in Lymington, Lanarkshire, Scotland; graduate of Victoria College, Canada, 1848; was pastor in Presbyterian Church, 1853-1857; professor of Toronto Normal School, 1854-1857; examiner in the university, 1853-1863; superintendent of classical schools, Ontario.

ORTON, EDWARD, LL. D., Ph. D., in Columbus, Ohio, October 16; born in Deposit, N. Y., March 9, 1829; graduate of Hamilton College, 1848; 1856-1865 taught in a normal school in Albany, N. Y.; became president of Antioch College, Yellow Springs, Ohio, 1873; for several years was president of the Ohio College of Agriculture; was assistant in United States Geological Survey; was president of the State Sanitary Association and of the Ohio Academy of Sciences; president of the American Geological Society, and two years later of the American Association for the Advancement of Science; published several works relative to his scientific specialty.

PARSONS, EBENEZER GREENLEAF, in Derry, N. H., December 10; born in Westport, Me., May 15, 1813; graduate of Bowdoin, 1833; taught one year; was pastor of several Congregational churches; principal of Pinkerton Academy, Derry, N. H., 1869-1882, and principal of Dummer Academy, Byfield, Mass., 1872-1882.

PATTEN, DANIEL DANA, in Cambridge, Mass., February 14; born in Candia, N. H., April 25, 1829; graduate of Dartmouth 1855; taught at Chester Academy and at Friends' School, Providence, R. I.; was admitted to the bar in 1861; was principal of high schools at Stoneham and Winchester, Mass., 1866-1873, of the high school, Portland, Me., 1873-1877; subsequently took charge of boys' school.

PAYNE, REV. CHARLES HENRY, D. D., LL. D., educator, at Clifton Springs, N. Y., May 5; born in Taunton, Mass., studied at the Concord, N. H., Biblical Institute; served as pastor in New York, Brooklyn, and Philadelphia conferences; 1875, was elected president Ohio Wesleyan University; resigned in 1888 to become corresponding secretary of the board of the Methodist Episcopal Church; was member of the commission to revise the church hymn book and of the Methodist conference in London in 1881, and was five times member of the general conference of the M. E. Church. He was the author of several publications.

PENDLETON, WILLIAM K., in Bethlehem, W. Va., September 1; born in Yancyville, Va., September 8, 1817; took an elective course at the University of Virginia and graduated in law. In 1841 he was associated with Alexander Campbell in founding Bethany College and in 1866 was elected its president. From 1846 he was coeditor of *The Harbinger* and was on the editorial staff of the *Christian Standard*; was a member of the constitutional convention of West Virginia, 1871, and was twice elected State school superintendent, and drafted the school law which has remained much the same to date. In 1887 he resigned his presidency and removed to Florida.

PERKINS, FRED. K. BEECHER, librarian at Morristown, N. J., January 27; born in Hartford, Conn., September 27, 1838; studied at Yale, but graduated at State Normal School, Connecticut, 1852; 1880-1887 was librarian of the San Francisco public library; contributed largely to the improvement of library administration; published many books, and was noted for his antiquarian attainments. He was a grandson of Dr. Lyman Beecher.

PERRY, AMOS, historian, in New London, Conn., August 10; born in South Natick, Mass., August 12, 1812; graduated at Harvard 1837 and immediately devoted himself to teaching; was one of the founders of Rhode Island Institute of Instruction; was for twenty-five years custodian of the Rhode Island Historical Society and for some time was in the diplomatic service.

PETTIT, Mrs. ANNA STOCKTON, Ph D., in Potsdam, N. Y.: born in Canton, N. Y., 1863; graduate of the St. Lawrence University of New York, 1882; assisted her husband as principal of the Lawrence school. Lost her sight and became proficient in the use of the point type for the blind.

PLACE, WILLIAM F., in Francess town, N. H., November 14; born at Alfred, N. Y., May 6, 1844, and graduated at Williams College in 1873; taught in Alfred University, 1873-1877, academy at Walworth, Wis., 1877-1879; professor in Milton College, 1879.

RAYNER, WILLIAM S., philanthropist, in Baltimore, Md., March 1; born in Bavaria, 1821; removed to Baltimore in early life; he gave the ground and erected a building for the Hebrew Orphan Asylum; director of the House of Refuge; vice-president of the Poor Association, and manager of the Home for Incurables, to both of which he gave money and time.

REBISSE, LEWIS T., in Cincinnati, Ohio, May 3; born in Italy in 1837; took part with Mazzini in the endeavor to establish an Italian republic; became distinguished as a sculptor. His work may be seen in the statue of McPherson, Washington; Grant monument, Chicago; and President Harrison's statue, Cincinnati. From 1875 was instructor in the McMicken School of Design.

REED, AMOS, author, in Remsenburg, Long Island, N. Y., August 19. Taught in Polytechnic Institute of Brooklyn; wrote an elementary text-book called "Graded Lessons in English," also other works on the same subject.

REYNOLDS, Gen. JOSEPH JONES, at Washington, D. C., February 26; born in Flemingsburg, Ky., January 4, 1822; graduate of West Point, 1843; major-general in the civil war; assistant professor at West Point; resigned from the Army to become professor in Washington University, St. Louis, Mo. He was a brave soldier and administered important commands with special approval.

RICHARDS, ZALMON, in Washington, D. C., November 1; born in Cummington, Mass., August 11, 1811; graduate of Williams, 1836, and began at once to teach; taught ten years at Stillwater, N. Y.; 1848-1851 principal of the preparatory department of Columbian College, Washington, D. C. He shared in the organization of the National Educational Association and was its first president. In 1861 was appointed to a clerkship in the Treasury, where he remained

for six years; 1860 was elected to the common council of the city, and made president of the council 1867; was a clerk under Dr. Barnard in the Bureau of Education; was appointed the first superintendent of the white schools of the city, holding the position one year; conducted a private school in Washington for several years, and throughout his life was an earnest worker for the promotion of public education.

**RICHARDSON, WILLIAM**, teacher, Ph. D., in New York city, April 15; born in Camaroon, Wales, 1859. He studied at Cooper Union, and subsequently held the post of director for nearly ten years.

**RICKOFF, ANDREW J.**, in San Francisco, Cal., March 29; born in New Hope, N. J., August 23, 1824. In 1830 his parents removed to Cincinnati. He began to teach at the age of 17, and by untiring application to his studies won from the Ohio University the degree of A. M.; was five years superintendent of schools in Portsmouth, Ohio; then taught in the public schools of Cincinnati, where after two years he was appointed superintendent of schools and continued in the office five years; conducted a private school nine years; was elected to the city board of education in 1864, and was its president for two years; subsequently superintendent of the schools in Cleveland; after fifteen years in this service he became superintendent in Yonkers, N. Y. Resigning this office he returned to Ohio and then removed to California. In 1859 was elected president of the National Educational Association. In 1885 was president of the Ohio State Teachers' Association. In 1880 was elected member of the National Council of Education, limited to 52 members. For several years after 1888 he was in charge of Felix Adler's workingman's school. He was the author of an arithmetic and other text-books, and joint editor of a series of six readers. He secured the reorganization of the educational system in Cleveland on a basis which is still maintained and which was highly commended at the Centennial Exposition in Philadelphia in 1876. His system has been widely followed. He paid special attention to school architecture and to the heating and ventilation of school buildings, and received at the Centennial Exposition a medal for his designs.

**ROPES, JOHN CADMAN**, in Boston, Mass., October 28; born in St. Petersburg April 28, 1836; graduate of Harvard, 1857; admitted to the bar in 1861; took great interest in military affairs; promoted the organization of the Military Historical Society, Massachusetts, and was largely instrumental in inducing the United States Government to attempt the collection and preservation of information relative to the civil war. He published several works on this subject.

**RUST, Mrs. RICHARD S.**, in Cincinnati, October 3; born near Baltimore, Md., in 1833. Her maiden name was Elizabeth Townes. Her family moved to the neighborhood of Dayton, Ohio, and she graduated at Cooper Academy in 1853; was one of the founders of the Methodist Home Missionary Society, June 8, 1880, of which she was secretary, Mrs. Rutherford B. Hayes being at the same time president. She greatly assisted her husband in the Freedmen's Aid and Southern Education Society. She was active in securing women supervisors for criminals and in securing the introduction of domestic science in public schools, as well as in those under the direction of the Freedmen's Society.

**RYDER, JOHN C.**, in Bangor, Me., February 15; born in Readfield, Me., in 1856; graduate of Colby University, 1882. He was teacher in Roxbury High School, and for three years was master of Brighton High School.

**SAVAGE, Rev. CHARLES ALBERT**, Orange, N. J.; born in Stowe, Vt., July 10, 1849; graduate of Dartmouth in 1871; taught at St. Johnsbury, Vt., three years, and was professor of mathematics, Robert College, for four years.

- SAVAGE, PHILIP H., in Boston, June 5; born in Boston, Mass., February 13, 1868; graduate of Harvard, 1893; was editor of Harvard Monthly; was instructor in the Massachusetts Institute of Technology, and became secretary to Librarian Putnam in the Boston Public Library, and his successor when Mr. Putnam was appointed librarian at Washington, D. C.
- SAWYER, THOMAS J., in Somerville, Mass., July 23; born in Reading, Vt., January 9, 1804; graduate of Middlebury College, 1829; was pastor in New York nearly twenty years: 1845-1852 was president of the Clinton Liberal Institute, New York, and in 1847 was one of the founders of Tufts College, at Medford, Mass., where he became active professor and later professor emeritus.
- SMITH, REV. BURRETT A., in Worcester, Mass., June 16; born in New Haven County, Conn., August 4, 1820; graduate of Yale, 1843; taught in New London; was instructor in University of Michigan; was five years instructor in Leicester Academy, Massachusetts. After leaving there was a successful teacher of boys' private schools in New Haven and New York.
- SOUTHWORTH, MRS. EMMA D. E. N., in Washington, D. C., July 30; born in Washington, D. C., December 26, 1819; taught public school in Washington for five years; wrote several stories to increase her income, which proving eminently successful she devoted herself entirely to this branch of literary work, in which she achieved wide reputation.
- SPAULDING, FRANK BRIGHAM, in Boston, January 21; born in Dracut, Mass., December 28, 1853; graduate of Dartmouth, 1881; taught in West Lebanon, N. H., Providence, R. I., Townsend, Vt., Bradford, Pa., and Winthrop, Mass.; was manager of the Teachers' Cooperative Association from September, 1887, until his death.
- STEVENS, MRS. MARTHA B., in Hoboken, N. J., April 1; born at Princeton, N. J. She aided education by bequests to Stevens Institute, by establishing a school for manual training and erecting a building for a free public library.
- STILLÉ, CHARLES JANEWAY, LL. D., at Atlantic City, August 11; born in Philadelphia September 23, 1819; member of the United States Sanitary Commission and author of its history; 1866 professor in the University of Pennsylvania, and in 1868 its provost or president, which office he held until 1880.
- STRIEBY, REV. M. E., D. D., at Clifton Springs, N. Y., March 16; born in Columbiana, Ohio; removed to Wooster, Ohio; entered Hudson College, but graduated at Oberlin, 1835; became pastor in Ohio and New York, and was chosen secretary of the American Missionary Association; was active in establishing its many schools in the South—Fisk, Hampton, Atlanta, and about twenty other chartered institutions; of these he was a helpful counselor till his death.
- SUMMERS, THOMAS O., M. D., in St. Louis, Mo., June 19; born in Charleston, S. C., November 10, 1849; was in the Confederate service; was professor in Vanderbilt University, and in 1895 was called to a chair in the College of Physicians and Surgeons in St. Louis. In the Spanish war was surgeon to the Second Tennessee.
- SWALLOW, GEORGE CLINTON, M. D., LL. D., April 21, Evanston, Ill.; born in Buckfield, Me.; graduate of Bowdoin, 1843; taught five years in Brunswick; for two years was instructor in the University of Missouri at Columbia; in 1853 State geologist; 1864-65 was State geologist of Kansas; 1867 engaged in exploring Montana; 1870 was recalled to Missouri, where he became dean of the Agricultural College.
- SYLVESTER, REV. CHARLES S., in Feeding Hills, Mass., January 25; born in Williamstown, Mass., 1826; graduate of Williams, 1846; was settled in several pastorates; for five years was associated with Mr. Quong in preparing textbooks for the schools of China.

SYNNOT, JAMES J., D. D., in Montclair, N. J., March 16; born on Long Island, N. Y., February 6, 1863; graduate of St. Francis Xavier College, 1882; studied six years in Austria; 1889 became professor in Seton College, South Orange, N. J., where he remained until he became president in 1897, which position he held until his death.

TALBOT, REV. BENJAMIN, at Columbus, Ohio, January 16; born in Brooklyn, N. Y., May 22, 1826; graduate of Yale in 1849; taught in New Haven, and was principal of Williston Seminary, Massachusetts; subsequently entered upon his life work as teacher of the deaf and dumb. After teaching for a period in the Columbus school he became superintendent of the Iowa Institute.

TALBOT, ISRAEL TISDALE, in Hingham, Mass., July 3; born in Sharon, Mass., October 29, 1829; graduated at the Pennsylvania Homeopathic Hospital; studied four years in Europe; originated the Homeopathic Medical Dispensary. He was active in organizing the Boston University School of Medicine, of which he was from its commencement dean and professor; was member of Homeopathic Congress in London, 1881; for several years edited the New England Medical Gazette.

TAYLOR, CHARLES FAYETTE, M. D., in Los Angeles, Cal., January 25; born in Williston, Vt., April 25, 1827; graduated from the medical department of the University of Vermont in 1856; studied the Swedish movement cure with Dr. Roth in London, and applied himself to the treatment of the crippled and deformed; made various useful contrivances to assist in this work; published extensively, and was a benefactor to those suffering from deformities.

THAYER, ELI, in Worcester, Mass., April 15; born at Mendon, Mass., July 11, 1819; graduate of Brown University, 1845, and became principal of Worcester Academy in 1845; he established the Oread Institute, Worcester, Mass., a collegiate school for girls, in 1848; was a member of the Massachusetts legislature; founded the town of Ceredo, Va., and was Representative in Congress, 1857-1861.

THOMPSON, MRS. ELIZABETH ROWELL, in Littleton, N. H., July 20; born in Lyndon, Vt., February 21, 1821; daughter of a poor farmer; in 1844 married a millionaire philanthropist, Thomas Thompson, of Boston, and at his death followed his charitable example; devoted \$10,000 to the investigation of the yellow-fever epidemic; founded the town of Longmont at the base of the Rocky Mountains, giving 640 acres of land and \$300 to each colonist; contributed to the purchase of a telescope for Vassar College. Presented Carpenter's painting of the signing of the Emancipation Proclamation to Congress, and was given the freedom of the floor of the House of Representatives. She was patron of the American Association for the Advancement of Science; she cooperated with the Bureau of Education in advancing the kindergarten, the teaching of industries and good manners.

THOMPSON, F. F., in New York City, April 10; born there in 1836; graduated at Williams College in 1851; was the founder of several banks; presented Williams College with chemical laboratories and a fund for the support of free courses of lectures; erected a building for Vassar at a cost of \$200,000; gave largely for the Teachers' Collegé, New York City, and for the Ontario orphan asylum; for many years supported four students at his favorite colleges, Williams and Vassar.

TRUFANT, ISALAH, in Cundy Harbor, Me., July 23; born in Harpswell; graduate of Bowdoin; taught school many years in the West and South, and was principal of Parsonsfield Academy, Parsonsfield, Me.

TUCKER, GIDEON J., in New York City, July 7; born there February 10, 1826; received a common school and legal education; became editor of the Albany Argus. In 1855 founded the Daily News; 1857 was elected secretary of state, and was made a regent of the university and granted the degrees of A. M. and LL. D. Was elected to the assembly in 1863, and secured the passage of the law for the prevention of cruelty to animals, and the act fixing provisions for the free college; was a member of the State constitutional convention 1867-1894.

TURNER, J. B., in Jacksonville, Ill., January 10; born in Templeton, Mass., December 7, 1805; graduate of Yale in 1833; became professor at Jacksonville College, but resigned in 1847 and devoted himself to farming, introducing the osage orange hedge to the Western prairie, and before 1850 formulated the plan for an agricultural and industrial university. By his persistent advocacy of this interest he helped to excite the attention of Congress to its importance and thus assisted in bringing about the act of 1862 establishing agricultural and mechanical colleges; was well known as lecturer, editor, and preacher; published a volume against Mormonism.

TURRENTINE, JOHN, in Marionville, Mo., October 27; born in Alabama, December 12, 1834; obtained his education with difficulty; taught in high schools at McLeansboro, Enfield, and Carmi, Ill., and in a college at Enfield until 1879, when he removed to Marionville, Mo., and became president of the Collegiate Institution, which position he held until his death.

VANDERBILT, CORNELIUS, in New York City, September 12; born in New Dorp, Staten Island, N. Y., November 27, 1843; educated in the common schools; became clerk, and in 1865 assistant treasurer of the Harlem Railroad. In 1877, after the death of his grandfather, was vice-president of the New York Central Railroad, having control of its finances. On his father's death, December 8, 1888, he became the head of the Vanderbilt family. At the time of his death he was connected with 54 railroad companies. He gave constant attention to the several charitable organizations with which he was associated. In 1886 was one of the contributors of the \$250,000 for the Vanderbilt clinic. In 1897 gave \$250,000 to the St. Bartholomew's Home; contributed to the railroad branches of the Young Men's Christian Association; made gifts to Yale College amounting to \$1,500,000; presented the Rosa Bonheur painting, "The Horse Fair," to the Metropolitan Museum, having paid for it the sum of \$53,000 at the sale of the Stewart collection; gave \$100,000 to the Cathedral St. John the Divine, New York City. He was also a member of a large number of beneficial associations.

WALKER, AARON, in Providence, R. I., January 22; born in Belchertown, Mass., August 22, 1815; graduate of Amherst College, 1841; taught in Ware, Mass., over twenty years; in Lowell 1842-1845, in Boston 1845-1864; was a member of the Christian Commission, New Orleans, La., 1854-1866, and superintendent of the Government schools for colored people. He studied medicine at Harvard and at New York, and secured the degree of M. D. in 1868; practiced his profession in Manchester, N. H., two years, and in Denver, Colo., for fifteen years.

WATERMAN, L., in New York City, March 16; born in Bavaria, Germany, February 22, 1817; studied at Erlangen; emigrated to America 1840; engaged in business in New Haven, and subsequently taught German at Yale, where he received a degree in 1848, being the first Jew so honored by the college; became a surgeon and for thirty years filled the post of police surgeon in New York City, doing good work during the riots of 1863; made a special study of spectroscopic analysis, and in 1868 introduced it into medical

practice; was for fifteen years physician of the Hebrew Orphan Asylum, New York; was professor in the eclectic medical college, and was one of the founders and medical directors of the home for the aged at Yonkers; was one of the founders of the Maimonides Library; was a man of exceptional talents and broad sympathies.

WATTERSON, Rev. J. A., D. D., in Columbus, Ohio, April 17; born in Blairsville, Pa.; graduated at St. Mary's College, Emmitsburg, Md., 1865; became a member of the faculty and succeeded Dr. McClosky in 1877 as president of the college. In 1880 was made bishop of Columbus, Ohio, established a college, and had under his supervision three academies and 22 parochial schools.

WEBB, JOSIAH B., in Portland, Me., May 20; born in Windham, Me., January 19, 1826; educated at Gorham; given an honorary A. M. by Bowdoin; was principal at Gorham four years, at Yarmouth one year; was several years county supervisor of schools.

WEBB, WILLIAM H., shipbuilder, in New York City, October 30; born there June 19, 1816. He built and endowed Webb's Free Academy and Home for Shipbuilders, on Fordham Heights, N. Y.

WHITNEY, I. S., in Riverdale, February 8; born in Henniker, N. H., September 20. For many years taught in the old-fashioned singing school; began to teach singing in Manchester public school in 1860, and was there employed eleven years; leader and promoter of musical affairs.

WILD, Mrs. MARY A. P., benefactress, in Boston, in December. She gave of her estate, valued at over \$200,000, gifts to public objects to the amount of \$60,000, and private gifts amounting to over \$100,000; divided the residue of her estate among important institutions.

WILKIE, WARREN, in Austin, Ill., February 10; born in Evans Mills, N. Y., February 25, 1835; graduated at Union College in 1855; was principal of the Aurora, Ill., Academy ten years and of Oak Park for nine years following; was also superintendent of schools at Lake and at Aurora, Ill.

WILLIAMS, ED. H., in Santa Barbara, Cal., December 21; born in Woodstock, Vt., June 1, 1824; graduated at Vermont Medical College in 1846; was assistant superintendent of various railroads from 1851-1865; 1865 general superintendent of Pennsylvania Railroad; traveled extensively; 1881 built Williams Hall for Carleton College, Minnesota, and presented that college a 16-inch telescope; 1884 he built and endowed the public library at Woodstock, Vt.; he also erected a building for the University of Vermont.

WILLIAMS, Rev. JOHN, in Hartford, Conn., February 7; born in Deerfield, Mass., August 30, 1817; graduate of Trinity College in 1835; was ordained in 1838; was president of Trinity College in 1848-1853, and retained active connection with the college for nearly forty years. Upon the founding of the Berkeley Divinity School at Middletown, Conn., in 1854, he became the first dean, and remained at its head until his death. He published several books on theological subjects.

WINTHROP, WILLIAM, at Atlantic City, April 8; born in New Haven, Conn., August 3, 1831; graduated at Yale in 1851, and after studying law at Yale and Harvard began to practice; 1861 enlisted as a private, was rapidly promoted, and in 1874 was made professor of law at West Point, which position he held until 1890. He wrote extensively on military affairs.

WOOD, WILLIAM, M. D., in Portland, Me., January 22; born at Scarboro, Me., October 2, 1810; graduate at Bowdoin 1829; was one of the founders and chief benefactor of the Portland Natural History Society, and its president for nearly half a century.

WOODBRIDGE, LUTHER DANA, M. D., at Williamstown. November 10; born at Perth Amboy, N. J., December 27, 1850; graduate of Williams 1872; taught a year in the American (Robert) College at Constantinople; was physical instructor in Williams, and took his medical diploma at the college of physicians 1877; lectured before the Boston college of physicians; was prominent in medical affairs.

YOUNG, JOHN RUSSELL, journalist and librarian, in Washington, D. C., January 17; born in Downingtown, Pa., November 20, 1841; was educated in the public schools of Philadelphia and New Orleans; 1857 was a copyholder on the Philadelphia Press; subsequently became war correspondent, and finally chief editor of the Philadelphia Press until 1865. In 1866 joined the staff of the New York Tribune and became its managing editor, 1871-1877. Accompanied ex-President Grant on his journey around the world as the correspondent of the New York Herald. In 1882 was appointed minister to China, which post he resigned in 1885; was appointed June 30, 1897, the first librarian in the new library building at Washington. He was the author of "Around the World with General Grant," two volumes; of a Memorial History of Philadelphia, from its first settlement to 1895.

## 1900.

ADAMS, ENOCH G., South Berwick, Me., November 4; born at Bow, near Concord, N. H., February 20, 1829; graduated at Yale. 1849; taught in Newmarket, Stratford, and Durham, N. H., 1850-1853, and in other New England towns; 1853-1856 taught in Missouri; returned to the East and taught in Newburyport, Mass., and Durham, N. H. Entered the Army as a private in the Second New Hampshire Regiment and served throughout the civil war. In 1866 for a few months edited the Frontier Scout; 1866-1868 taught in Portland, Oreg.; 1868-1871 was editor of the Vancouver Register, at Vancouver, Wash.; 1880-1886 edited and published the Columbia. In his latter years wrote and lectured.

ALEXANDER, W. S., in Cambridge, Mass., May 15; born in Killingly, Conn., August 29, 1835. Studied two years at Yale; graduated from Andover Seminary, 1861; same year received his degree from Yale; 1876 became professor in Straight University, New Orleans, and in 1877 was made its president. The degree of S. T. D. was conferred on him by Beloit College; 1884 resigned the presidency of Straight University and returned to Cambridge, Mass., where he held a pastorate until 1896.

ALLEN, JAMES THEODORE, in West Newton, Mass., June 9; born in Medfield, 1831. Taught in Easton and South Natick, Mass.; 1852-53 in Provincetown; subsequently instructor in the Rensselaer Polytechnic Institute, Troy, N. Y. In 1858 became associate principal of the West Newton English and classical school. Studied abroad, 1859-1862.

ARNOLD, OWEN B., August 30; born in Haddam, Conn., July 11, 1818. Graduated from Yale, 1837; taught in Oglethorpe University, Georgia, 1837-1840; for twelve years was active trustee of the Connecticut State reform school and president of Meriden Connecticut National Bank.

BALDWIN, Dr. JOS., in Austin, Tex., January 13; born October 31, 1827, in New-castle, Pa. In 1852 he graduated from Bethany College, Virginia. Shortly after his graduation he removed to Platt City, Mo., where he was engaged in teaching. He taught subsequently at different places in that State and also in Indiana, to which State he removed in 1857. During the civil war he was a soldier in the Federal Army. In 1867 he returned to Missouri and established in Kirksville, that State, a private normal school. In this enterprise he was so successful that his school was made a State institution, he himself

remaining as principal. In 1881 he went to Texas to conduct a summer normal school in San Marcos, the first summer normal ever held in that portion of the State. The principalship of the Sam Houston Normal Institute, located at Huntsville, that State, having become vacant, Dr. Baldwin was offered the position. This he accepted and served as principal of that institution until 1891, when he was elected professor of pedagogy in the State University. His university chair he held until 1897, when he was made emeritus professor of pedagogy. He was the author of the following educational works: (1) *The Art of School Management*; (2) *Elementary Psychology and Education*; (3) *Psychology Applied to the Art of Teaching*; (4) *School Management and School Methods*. Dr. Baldwin belonged to the great evangelistic school of modern education which converted the people of this country to two propositions: (1) Public education at public expense is a necessity; (2) teachers employed in these schools should have such training as fits for professional work.

**BARNARD, HENRY, LL.D.**, in Hartford, Conn., July 21; born in Hartford, Conn., January 24, 1811; graduate of Yale, 1830; admitted to the bar in 1835; spent fifteen months in study and travel in Europe, paying especial attention to educational and reformatory institutions; elected to the legislature of Connecticut in 1837, and selected to organize a common school system for the State, 1838-1842. He effected great improvements in schoolhouses and in methods of instruction; 1843-1849 was school commissioner of Rhode Island, and made similar improvements in that State. For four years, beginning with 1850, was State superintendent of schools in Connecticut; 1857-1859 was president of the University of Wisconsin; 1865-66 was president of St. John's College, Annapolis, Md.; for three years, 1867-1870, was Commissioner of Education for the United States, being the first incumbent of that office. He formed important plans for the advancement of education and gathered valuable material from this and from foreign countries, but on account of the failure of both Houses of Congress to concur, as required by law, in the resolution to publish, this material was not made available for the public as originally intended and urged upon Congress by his successor and Secretary Cox. The Senate ordered the publication of two reports by Commissioner Barnard. The bulk of the material collected by him he was permitted to retain, and it was eventually published in his journal and thus became the valuable possession of the public. He had begun the publication of this work, the *American Journal of Education*, in 1855, and after retiring from the Education Office he devoted his attention to it until his death. The publication reached a total of 31 volumes and contained more than 800 treatises. Each treatise was also published separately. The whole work constitutes an American library on schools and education. In celebration of Dr. Barnard's eighty-seventh birthday, January 24, 1898, the public schools of Hartford were closed, and a distinguished audience gathered in the capitol to do him honor.

**BARRY, Rev. J. E.**, vicar-general of the Catholic diocese of Manchester, N. H.; was killed by a cable car in New York City, November 14; born in Eastport, Me., August 11, 1836; was educated in the Academy of St. John, in New Brunswick, at Holy Cross College, and the Montreal Seminary. In his devotion to the care of the children of his church he founded the Sacred Heart school; was for a number of years member of the Concord school board, and was three times appointed trustee of the State asylum for the insane.

**BEALS, SAMUEL DE WITT**, in Omaha, Nebr., April 27; born in Chenango County, N. Y., January 10, 1826; early began to teach in his native village. In 1861 moved to Omaha and opened a private school; in 1869 was appointed by the

governor of Nebraska State superintendent of public instruction. In 1871-72 classified the schools of Omaha; in 1872-73 was principal of one of the Omaha schools; was elected superintendent of Douglas County in the fall of 1873, and resigned in 1874 to become superintendent of the Omaha schools, where he continued for six years; afterwards he was occupied as teacher in the high schools or as librarian.

BEECHER, REV. CHARLES, in Georgetown, Mass., April 21; born in Litchfield, Conn., October 7, 1815; was a son of Lyman Beecher; graduated at Bowdoin in 1834, and later from Lane Seminary; 1844-1871 was pastor of Second Presbyterian Church in Fort Wayne, Ind. Was for two years State superintendent of instruction in Florida; was a gifted musician and had charge of the music in the compiling of the Plymouth collection of hymns and tunes.

BEHREND, REV. A. J. F., D. D., in Brooklyn, N. Y., May 22; born in Nymwegen, Holland, December 13, 1839; came to this country in 1845; graduated at Denison University, Granville, Ohio, 1862, and at Rochester Theological Seminary, 1865. In 1886 was chosen the Ely lecturer at Hartford Theological Seminary. His lectures were published under the title of *Socialism and Christianity*. He was the Lyman Beecher lecturer at Yale Divinity School in 1890; was chaplain of Thirteenth New York Regiment; was prominent in the Ecumenical conferences on foreign missions.

BETHSON, U., in Louisville, August 16; born in Louisville, 1838; moved to New Orleans before the war; was professor in Tulane University.

BLODGETT, LORIN, in Philadelphia, March 24; born in Jamestown, N. Y., in 1821. He was an eminent statistician and one of the foremost authorities on the higher economics. In 1851 he received an appointment in the Smithsonian Institution at Washington, being placed in charge of the researches on climatology. His works on atmospheric physics were among the first on the subject published in this country.

BLONDEL, FREDERICK HERBERT, at Stamford, Conn., March 11; born August 7, 1856, at Topsham, Me.; graduate of Bowdoin College, 1882; taught at What Cheer, Iowa, and was superintendent of schools at Port Washington, Wis.

BOLTER, ANDREW, entomologist, in Chicago, March 18; born in Sigmaringen, Prussia, in 1820; was a member of the Academy of Sciences in Chicago and of the New York Entomological Society. Was regarded as an authority in entomology, although he published no works on the subject. His collection of insects, said to be the finest on the Continent and one of the most complete private collections in the world, will probably go to the University of Illinois.

BOWEN, Miss ANNA MAUD, in Chicago, January 28; born there in 1872; graduated from the Chicago University 1894; in 1895 was made a fellow of philosophy at Cornell, and two years later received the degree of Ph. D. She was made dean of the seminary at Martins Ferry, Ohio; was an editorial writer on *The Nation*; in 1899 was appointed dean of Woman's Hall, Northwestern University.

BRADEN, JOHN, educator, in Nashville, Tenn., June 10; born August 18, 1828; graduate of Ohio Wesleyan University in 1853; taught a year in Xenia Female Seminary; 1863 was appointed principal of the city schools of Nashville; 1869 became the founder of Central Tennessee University, one of the largest institutions in the South for the education of colored youth; he was its president from 1869.

BRADFORD, Mrs. JULIET S., August 29; bequeathed to Washington and Lee University \$100,000 as endowment.

- BROWN, H. W., in Daytona, Fla.; born in Worcester, Mass., 1832; was instructor twenty-one years in Worcester Normal School.
- BROWN, MOSES TRUE, elocutionist, in Sandusky, Ohio, September 11; born in Deerfield, N. H., March 4, 1827; taught school for some time and was for six years superintendent of the public schools of Tolédo, Ohio; for twenty years was professor of oratory in Tufts College. During this time taught in the Boston School of Oratory, and in 1886 became its president; 1899 was elected to the chair of the philosophy of expression in Ohio Wesleyan University.
- BROWNING, WILLIAM W., in Brooklyn, October 3; born in Metuchen, N. J., March, 1852; graduated from Yale 1873, and from Columbia Law School 1875; studied medicine and graduated from Bellevue Medical College; was demonstrator of anatomy in Long Island College Hospital 1885-1894; lecturer on anatomy; 1893 published a book entitled "Modern Homeopathy."
- BRUCE, CATHERINE W., in New York City, March 13; born there January 22, 1816. She built and endowed the George Bruce Free Library and branch of the New York free circulating library; in 1888 gave to Harvard College \$50,000 for a photographic telescope; 1897 gave a fund to the Astronomical Society of the Pacific for the award of a gold medal once a year for distinguished service in astronomy. She wrote and published a translation of the *Dies Iræ* in 1890.
- BUGBEE, EDWIN HOLMES, in Putnam, Conn., January 26, 1900; born in Thompson, Conn., April 26, 1820; for many years member of the general assembly of Connecticut; speaker of the house in 1871; 1870 lieutenant-governor and ex officio chairman of the senate. He left his large library by his will, together with the sum of \$15,000, to the Free Library Association of the borough of Danielson, Conn.
- CARMAN, ELBERT S., journalist, in New York City, February 28; born in Hempstead, L. I., 1836; graduated at Brown University 1858; was associate editor and later was owner of the *Rural New Yorker*. He established the experimental grounds at River Edge, N. J., which were devoted to the testing of new plants, vines, and seeds and the originating of new varieties.
- CHAMBERLAIN, Hon. MELLEN, lawyer, judge, author, and historian, in Chelsea, Mass., June 25; born at Pembroke, N. H., June 4, 1821; graduated at Dartmouth 1844; taught several years at Brattleboro, Vt.; practiced law in Boston; was judge of the municipal court 1866-1878; was librarian of the public library 1878-1890, and did much to promote its efficiency; was the author of several books.
- CHENERY, Dr. ELISHA, in Boston, August 1; born in Livermore, Me., August 23, 1829; graduated from the Wesleyan Seminary, Kents Hill, Me., and from Harvard Medical School 1853; 1876-1880 was professor of pathology and therapeutics at the Boston Dental College and dean of the faculty.
- CHURCH, FREDERICK E., landscape painter, in New York City, April 7; born in Hartford, Conn., May 4, 1826; was a pupil of Thomas Cole, the artist, in Catskill, N. Y.; established his studio in New York City. His pictures received extensive recognition and many honors. He did much for the establishment and development of the Metropolitan Museum of Art in New York City, and also to promote the study of art throughout the country.
- CHURCHILL, JOHN W., D. D., in Andover, Mass., April 13; born May 26, 1839; graduated at Harvard 1865 and at Andover Seminary 1868. On the day of his graduation was made professor of elocution and lecturer on literature, and afterwards was appointed professor of sacred rhetoric; was a regular instructor for the academy and Andover Seminary and in numerous institutions, and served as editor of the *Andover Review*.

- CLARK, JONAS G., philanthropist, in Worcester, Mass., May 23; born in Hubbardston, Mass., February 1, 1815. He worked on his father's farm and as an apprentice to the carriage maker's trade, and later engaged in the manufacture of tinware; in 1853 went to San Francisco and took up in addition to his hardware business the shipping of furniture. He made money rapidly, and invested freely in real estate. In 1880 he removed to Worcester, Mass., and in 1887 founded and endowed Clark University with \$2,000,000; also built a fine library in Hubbardston and gave property to endow it.
- CLARK, L. W., in Manchester, N. H., May 28; born in Barnstead, N. H., August 19, 1828; graduated from Dartmouth 1850; was principal of the Pittsfield Academy, N. H., two years.
- CLARK, MAJ. SELDEN NOYES, in Washington, D. C., October 9; born in Portageville, N. Y.; was educated in the common schools; enlisted as a private; was appointed adjutant of General Thomas's regiment in the corps raised by General Eaton; was retained in the Freedmen's Bureau; was for a time Indian agent, and subsequently a clerk in the Bureau of Education, engaged particularly on the report on libraries. He became finally correspondent of the New York Tribune, which position he held until his death. His son, Dr. Victor S. Clark, was for a time in charge of education in Porto Rico.
- COGSWELL, HENRY D., in San Francisco, July 9; born in Tolland County, Conn., in 1826. Left to care for himself in early life, he worked in a cotton factory, taught a district school, and studied dentistry in Providence, R. I., where in 1847 he opened an office for its practice. In 1849, in the midst of the gold excitement, he took a stock of merchandise to California, and remained there, practicing dentistry and trading, for thirty years. He founded a dental college in San Francisco and conveyed it in trust to the regents of the State University of California. He also established the Cogswell fund for the aid of students needing assistance. As a matter of public beneficence and to promote temperance, he caused to be erected at his own expense elaborate and highly ornamental drinking fountains of bronze or granite in 31 different cities and towns in the United States. The fountain erected in Washington, D. C., was accepted by a joint resolution of Congress July 6, 1882. He donated \$35,000 to the founding of the Cogswell Philanthropic Society, and established its annual course of lectures.
- CONKLIN, MRS. JENNIE M. DRINKWATER, author, in New Vernon, N. J.; born in Portland, Me., April 14, 1841. She was educated in the public schools of Portland and at Greenleaf Institute, Brooklyn; in 1880 married Rev. Nathaniel Conklin, pastor of Presbyterian church in New Vernon. She was the originator of the Shut In Society, a bureau of correspondence for invalids, which publishes the Open Window. She is best known as a writer for the religious press and author of books for girls.
- CONRAD, VICTOR L., journalist, in Philadelphia, January 7; born in Pine Grove, Pa., October 7, 1824; graduated at Gettysburg in 1851, and the same year was licensed to preach; 1852 was editor of the Evangelical Lutheran at Springfield, Ohio; in 1856 was principal of a public school at Pittsburg, Pa.; 1857 took charge of Cooper Seminary for Young Ladies at Dayton, Ohio; 1867-1870 was professor of natural sciences in Penn College, Gettysburg, Pa.; 1870 removed to Philadelphia and with his brother assumed the duties of associate editor of the Lutheran Observer, which post he held until his death.
- COX, JACOB DOLSON, in Magnolia, Mass., August 4; born in Montreal, Canada, October 27, 1828; graduated from Oberlin in 1851, and in 1852 began to practice law; was elected to the State senate; entered the service as brig-

dier-general, and for gallant services at South Mountain and Antietam was made major-general. In 1865 was elected governor of Ohio by the Republican party; 1869-70 was Secretary of the Interior; in 1876 was elected to Congress; was dean of the Cincinnati Law School from 1881 to 1897, and for a time was president of the Cincinnati University. He supported General Grant's Indian policy.

CRAVATH, REV. ERASTUS M., in St. Charles, Minn., September 4; born in Hanover, N. Y., July 1, 1833; graduated at Oberlin in 1857, and in theology in 1860; was settled as pastor and became chaplain in the Union Army and was mustered out in June, 1865; was appointed field agent of the American Missionary Association to open a school in the central South. Accompanied by Rev. E. P. Smith he reached Nashville, October 3, 1860, and found Gen. Clinton B. Fisk in charge of freedmen with Prof. John Ogden, superintendent of schools, under him. Ogden, Smith, and Cravath bought a square of ground on their own responsibility and General Fisk secured the turning over to them of the hospital buildings on it, which were about to be torn down, thus saving the buildings for school purposes. The new enterprise was opened January 9, 1866. It was named the Fisk School, and John Ogden became its principal. The American Missionary Association and the Western Freedmen's Aid Commission bought the land of Smith, Cravath, and Ogden and sent a corps of 20 teachers to instruct the thousand pupils who were gathered there. In July, 1866, Secretary Smith was called to New York and Mr. Cravath was appointed to the secretaryship in Cincinnati and had charge of the collection of funds in the central Western States and of school work in Kentucky, Tennessee, and northern Georgia and Alabama. In 1870 he became field secretary of the whole work of the society in the South. In 1875 he resigned the secretaryship and was elected the first president of Fisk University. For three years he managed the tours of the original jubilee singers through Europe to raise funds for the university. He returned in 1878 and devoted himself until his death to the care of the growing university.

DAVIDSON, THOMAS, educator and philosopher, in Montreal, Canada, September 14; graduated at the University of Aberdeen, Scotland, in 1860 as first graduate and Greek prizeman, and until 1863 was rector of the grammar (Latin) school of Old Aberdeen; 1863-1866 taught in various schools in England and Scotland. In 1866 accepted a professorship in the London Collegiate Institute, Canada, and in 1867 came to the United States, settling in St. Louis as the classical master of the St. Louis High School, and later became principal of one of the branch high schools. In 1875 he removed to Cambridge, Mass., and continued to make that city his home when in the United States. He traveled extensively in Europe. His interest in Thomas Aquinas led to an invitation from the Pope to settle in Italy and to assist in the preparation of a new edition of the writings of that philosopher. He was interested in many philanthropic and educational movements, and was the founder of the Glenmore Summer School of the Culture Sciences at Keene, in the Adirondacks. Professor Davidson was widely known as a lecturer on history, philosophy, and archaeology. His publications were numerous and important, and covered a wide range of subjects.

DAVIS, CHARLES M., at Bayonne, N. J., August 1; born in Bloomfield, N. J., in 1824; graduated at Princeton; taught in Bloomfield and Newark; was associated with Dr. Charles F. Deems in the American Institute of Christian Philosophy, of which he was secretary; was for several years superintendent of public schools at Bayonne; was a member of the New Jersey State sanitary board and of the State council of educators.

DAY, REV. WILLIAM HOWARD, A. M., D. D., December 3; born in 1827; graduated at Oberlin in 1847. After years of usefulness as a colored educator and helper of his race he was ordained in 1866. He was general secretary of the A. M. E. Zion Church.

DORE, JOHN C., in Boston, December 14; born in Ossipee, N. H., March 22, 1822; graduated at Dartmouth in 1847, having been a student during the time of Professors Sanborn, Haddock, and Crosby, and the presidency of Dr. Lord. On his graduation was appointed usher or assistant principal of the Boylston School, of Boston; two years later he became its principal. In 1854 was invited to Chicago to become the first superintendent of public schools in that city at a salary of \$1,500. He introduced new conditions throughout the schools, classified and graded pupils, and founded the high school, thus shaping the system which has grown to enormous proportions. In 1856 he resigned his office and afterwards devoted himself to business. He was interested temporarily in the lumber trade, but especially occupied himself with insurance and banking. His efficiency in preserving the contents of banks in the great fire was specially recognized. He served during two terms as member of the school board, and during one of these as its president. In 1868-1871 was State senator.

DUNBAR, CHARLES F., journalist and educator; in Cambridge, Mass., January 29; born in Abingdon, Mass., July 29, 1830; graduated at Harvard in 1851; was in business for a considerable period, when he retired to a farm for his health. Subsequently graduated at Harvard Law School in 1858 and was admitted to the bar. For years he was a regular contributor to the Boston Daily Advertiser, of which in 1859 he became part owner and editor with Charles Hale. From 1864-1869 he was its sole editor. He traveled abroad for several years, and in 1871 he became professor of political economy in Harvard University. He served as dean of the college faculty from 1876 to 1882, and after the reorganization of that body was the dean of the faculty of arts and sciences from 1890 until 1895. He wrote much on public questions; was president of the American Economic Association in 1893.

EDDY, REV. W. W., in Beirut, Syria, January 29; born in Penn Yan, N. Y., December 18, 1825; graduated at Williams College in 1845; taught two years in Jacksonville, Ill.; graduated at Union Theological Seminary in 1850; became a missionary instructor and prepared a complete commentary in Arabic on the New Testament.

EGLESTON, THOMAS, in New York City, January 15; born there December 9, 1832; graduated at Yale in 1854; was assistant to Professor Silliman until March, 1855; he then went to Europe and graduated in Paris at the School of Mines in 1860; 1861 was curator of the Smithsonian mineralogical collection; in 1863 he prepared the plans for the Columbia School of Mines, and in January, 1864, was chosen professor of mineralogy and metallurgy; he held this chair until 1897, when he resigned on account of failing health and was made professor emeritus. He was one of the founders of the American Institute of Mining Engineers and its president in 1886; he was one of the founders of the American Meteorological Society and of the societies of mechanical and electrical engineers; was connected with the scientific work of the Union Pacific Railroad in 1866, and in 1868 was United States commissioner to examine the Atlantic coast fortifications; was at the head of various religious and charitable organizations. His publications were numerous and valuable.

EMERSON, REV. JOSEPH, D. D., LL. D., educator, in Beloit, Wis., August 4; born in Norwalk, Conn., May 28, 1821; graduated at Yale in 1841 and was for a time tutor there. In 1846 he and his classmate, Jackson J. Bushnell, were

invited to Beloit College. There were only three students and no college buildings until 1847, and for a time Messrs. Emerson and Bushnell constituted the faculty. Professor Emerson held the chair of Greek until his death. He was a favorite professor, and is said to have raised \$150,000 for the college. He published a volume of lectures and sermons and was specially interested in art.

EVERETT, REV. CHARLES CARROLL, D. D., LL. D., in Cambridge, October 17; born in Brunswick, Me., June 19, 1829; graduated from Bowdoin College in 1850 and served as tutor, professor, and librarian; studied in Berlin one year and graduated at Harvard Divinity School in 1859; was pastor for ten years at Bangor, Me. In 1869 he became professor of theology at Harvard and in 1878 became dean of the theological faculty, and continued in both positions until his death. He left a valuable legacy in his books.

EVERETT, ERASTUS, LL. D., educator, in Brooklyn, N. Y., May 7; born in Princeton, Mass., 1831; graduated at Dartmouth in 1836; removed to Baton Rouge, La., and with two associates founded the High School of New Orleans in 1843, and became its principal in 1849 and its first president when chartered as a college in 1854; taught select school in Brooklyn 1853-1875, and was professor in Rutgers 1875-1879.

FARNHAM, GEORGE L., August 2, at Birmingham, N. Y.; born in 1824; for a time superintendent of schools at Council Bluffs, Iowa, and afterwards principal of the State normal school, Peru, Nebr.

FEWSMITH, WILLIAM., at Merchantville, N. J., June 19; born January 24, 1836, at Philadelphia, Pa.; graduated at Yale in 1844; was for thirty years principal of the Fewsmith Classical and Mathematical School in Philadelphia, where he fitted many boys for Yale. For seven years was superintendent of schools in Camden, N. J. He edited a "Grammar of the English Language" and an "Elementary Grammar of English."

FINNEY, REV. THOMAS M., M. D., in St. Louis, October 1; born in St. Louis, July 13, 1827; graduated at Yale, 1847; was licensed to preach, 1850; was editor St. Louis Christian Advocate, 1869-1873; was one of the founders of Central College, at Fayette, Mo., in 1855; for forty years a director and from 1877-1880 president of Bellevue Collegiate Institute at Caledonia, Mo.

FLOOD, REV. FREDERICK WHITNEY, in East Dennis, Mass., August 13; born at Ellsworth Falls, Me., January 26, 1870; graduated at Bowdoin, 1894; taught in Fryeburg, Hampton, and in Gould Academy, Bethel, Me.; died while pastor at East Dennis.

FOX, JUNIUS B., educator, in Staunton, Va., March 27; born in Lincolnton, N. C., June 7, 1860; graduated at Gettysburg, 1880; was teacher at King's Mountain, 1880-1882, and Charlotte, N. C., 1882-1884; was for some time pastor and again teacher at Newberry College, S. C., whence he moved to Virginia.

FRITSCHER, REV. SIGMUND, D. D., in Dubuque, Iowa, April 26; born in Nuremberg, Bavaria, December 2, 1833, where he was educated. He moved to this country and became connected with the Iowa Synod. He was professor and for a time president of the seminary at St. Sebald, Iowa.

FROST, MRS. ELIZA A. DU BOIS, widow of Dr. C. P. Frost, of Dartmouth College. She was for many years associate principal of Thetford Academy.

GALPIN, REV. SAMUEL HENRY, at Savin Rock, Conn., September 12; born in Westfield, Conn., October 18, 1812; graduated at Yale, 1835; for a time taught in Connecticut and Natchez, Miss.; graduated from Hartford Seminary, 1844; taught in Lexington, Ky., and Indianapolis, Ind., until 1853; was clerk in

the United States Treasury for over twenty years. The Latin prize to be awarded to the freshman class at Yale is named for him.

GARRISON, REV. S. OLIN, in Vineland, N. J., in May. He was the son of Rev. Stephen A. Garrison and a graduate of Wesleyan University. For a number of years minister in Philadelphia. He became interested in epileptics and turned his attention to their education and comfort. The result was the founding of the State institution for epileptics for which, through his efforts, there were secured 170 acres of land on which are 10 buildings representing an expenditure of \$200,000.

GERRY, CHARLES F., in Sudbury, Mass., September 4. Was born in Sudbury, June 3, 1823; graduated at Middletown, Conn., 1851. Was a teacher in the Mercantile Academy and later in the Fort Hill School, Boston. He served several terms in the house and senate of Massachusetts.

GETCHELL, ISAAC, in Bangor, Me., August 5; born at Carroll, Me., March 10, 1846; graduated at Bowdoin College in 1877. Before receiving his degree he taught school thirty terms.

GIBIER, PAUL, M. D., in Suffern, N. Y., June 9; born in Andre, France, 1851; graduated from the University of Paris, where he became professor of comparative medicine; was at different times employed by the French Government as an expert in cholera and yellow fever, and for his services was made member of the Legion of Honor. He established the Pasteur Institute of New York City.

GILLESPIE, Miss JENNIE E., in Chicago, August 24, where she was born in 1851. She began teaching at 18 years of age, in which work she was very successful. In the Foster School, where she was principal for the last ten years of her life, the usual enrollment was 2,000.

GILMAN, REV. EDWARD W., D. D., at Flushing, N. Y., December 4; born in Norwich, Conn., February 11, 1823; graduated at Yale in 1843; studied at Union Seminary; ordained at Lockport, N. Y., December 4, 1849; taught in West Point, N. Y., in a private academy, and several years in New York City; was tutor at Yale; was a frequent contributor to the press and was greatly honored for his thirty years' service as secretary of the American Bible Society.

GOULD, REV. EZRA P., at White Lake, N. Y., August 23; born in Boston, Mass., February 27, 1841; graduated Newton Theological Institution, 1868, where he was professor of New Testament interpretation. He afterwards entered the Episcopal Church and held a similar position in the Philadelphia Divinity School.

GRAY, LANGDON C., in New York, May 8, where he was born April 3, 1850; left Columbia College in his junior year on account of failing sight; he completed his education at Heidelberg, Germany; became a specialist in neurology and professor in Bellevue Medical College.

GREEN, REV. WILLIAM HENRY, in Princeton, N. J., February 10; born in Groveville, N. J., January 27, 1825; graduated at Lafayette College in 1840; was tutor there for two years; graduated at Princeton Seminary, 1846, and was immediately appointed instructor in Hebrew; was ordained May 24, 1848; was pastor of Central Presbyterian Church of Philadelphia, 1849-1851, when he was chosen professor of Biblical and Oriental literature in Princeton Seminary; was moderator of the general assembly, 1891; was chairman of the Old Testament committee of the Anglo-American revision committee. As senior professor was official head of Princeton Theological Seminary, and in 1868 was offered the presidency of Princeton College, but declined it. He was a voluminous writer.

GUITNER, JOHN E., in Westerville, Ohio, September 4; born in Greencastle, Pa., January 21, 1841; graduated from Otterbein University in 1860; was tutor of ancient languages at Otterbein, 1862-1864; was professor of Latin from 1865-1867; was professor of ancient languages, 1867-1869, and filled the chair of Greek language and literature from 1869 until his death; was for a number of years treasurer and financial secretary of the college.

HALE, Miss LUCRETIA PEABODY, in Boston, June 12; born in Boston, September 2, 1820; was a sister of Edward Everett Hale. To her efforts in particular Boston was indebted for vacation schools and for the teaching of sewing and morals in the public schools. She was especially active in charities and was the author of many books and stories for children.

HAMLIN, Rev. CYRUS, D. D., educator, in Portland, Me., August 8; born in Waterford, Me., 1811; graduated at Bowdoin College in 1834, and at Bangor Seminary in 1837, and was missionary of the American board in Turkey from 1837 until 1860, when he became president of Robert College, Constantinople, which he had organized after a seven years' contest with Turkish authorities. In order to give employment to Armenians he introduced the making of bread with hop yeast. During the Crimean war this yeast was in great demand, and at its close he had cleared \$25,000 which he expended on churches and schools. He resigned the presidency of Robert College in 1876 and became professor in Bangor Theological Seminary. He was president of Middlebury College from 1880 to 1885, when he removed to Lexington, Mass. He made the first steam engine built in Maine. He published translations in the Armenian dialect, and *My Life and Times*, and other works.

HAMMOND, WILLIAM ALEXANDER, M. D., in Washington, D. C., January 5; was born in Annapolis, Md., August 28, 1828; graduated at the medical department of the New York University, 1848; entered the Army in 1849 as lieutenant and became captain in 1854; October, 1860, he resigned, to become professor of anatomy and physiology in the University of Maryland. At the beginning of the civil war he resigned his chair and reentered the Army as assistant surgeon, and in 1862 was promoted to Surgeon-General, with the rank of brigadier, but in 1864 was tried by court-martial and dismissed from the service. In 1868 he became professor in the College of Physicians and Surgeons in New York City, and later filled chairs in Bellevue Medical College and in New York University. In 1893 he was one of the founders of the post-graduate medical school, in which he became professor of diseases of the mind. In the meantime the President and Secretary of War had been authorized to review the proceedings of the court-martial, and in 1879, after fifteen years, he was restored to his position and retired as brigadier-general. He wrote many books on nervous diseases.

HAMMONS, EVERETT, in Anoka, Minn., October 15; born in Cornish, Me., January 10, 1850; graduated at Bowdoin College, 1870. Studied law and was admitted to the bar in Minnesota in 1872 and to the Maine bar in 1873; taught successively at Paris and Hallowell, Me., and Princeton, Minn. Returned to Maine, and in 1874 and 1875 taught in Bethel, that State; was principal of the grammar school, Clinton, Me., 1877-1880; served also as secretary of the board of education.

HARVEY, FRANCIS L., in Orono, Me., March 6; born near Ithaca, N. Y., in 1850; graduated from Iowa Agricultural College; was president of that institution and was later connected with Humboldt College, Iowa, and Arkansas Industrial University.

HAZEN, HENRY A., meteorologist, in Washington, D. C., January 23; born in Serur, India, January 12, 1849; graduated at Dartmouth, 1871; was instructor

in drawing in Sheffield Scientific School of Yale University until 1875; 1875-1879 was assistant professor in meteorology. In 1881 was appointed computer in the United States Signal Service. In 1887 became one of the regular officers in this Department and made forecasts for the whole country. In July, 1891, was made professor of meteorology of the Weather Bureau. He devised a system for reducing barometric observations to sea level, a sling psychrometer, and a thermometer shelter. In 1888 he published Meteorological Tables, and The Tornado in 1890.

HENDRIE, JOHN W., philanthropist, in Sound Beach, Conn., November 25; born there November 18, 1821; graduated from Yale in 1851. In 1854 he went to California, where he amassed a fortune in business, after which he returned to his native town. His largest gifts were \$15,000 to the Mercantile Library of San Francisco and \$10,000 to the Academy of Arts and Sciences in that city, and \$100,000 to Yale Law School.

HENNESSY, Rev. JOHN, in Dubuque, Iowa, March 4; born in Limerick, Ireland, August 20, 1825; removed to Carondelet, Mo., in 1847, where he studied theology. He was first settled at New Madrid, Mo., January 20, 1851. In 1854 he was called as vice-president and professor to Carondelet Seminary. In 1857 he became its president; was made bishop of Dubuque, Iowa, September 30, 1866, and archbishop September 17, 1893. He was instrumental in founding New Melleary Abbey and St. Joseph's College, Dubuque.

HENRY, WILLIAM WIRT, in Richmond, Va., December 5; born in Charlotte County, Va., February 14, 1831; graduated at the University of Virginia, 1850; was admitted to the bar, 1853; was president of the Virginia and also of the American Historical Society; was one of the trustees of the Peabody educational fund; was author of several works, but specially known for his Life of Patrick Henry, his paternal grandfather.

HENSHAWE, MARSHALL, in Amherst, Mass.; born in Bethany, Pa., October 3, 1820; graduated at Amherst, 1845. In 1846 taught Latin and Greek in Williston Seminary. He spent one year in Union Seminary, and was tutor in Amherst College two years, continuing also his theological studies, and was ordained February, 1849. Deciding to make teaching his life work, he became principal of Hopkins Academy, Hadley, Mass., 1849-50; of Pinkerton Academy, Derry, N. H., 1850-1852, and of Dummer Academy, Byfield, Mass., 1852-1859. From 1859 till 1863 was professor in Rutgers College, New Jersey; 1863-1877 was principal of Williston Seminary; 1877-1881 was in charge of a private preparatory school for boys in Newton, Mass. From 1881 to 1890 was lecturer on physics in Amherst College. He gave forty-five years of unremitting toil to the cause of education without the loss of a single day through illness.

HILL, NATHANIEL PETER, metallurgist, in Denver, Colo., May 22; born near Montgomery, N. Y., February 18, 1832; graduated at Brown University, 1856. For three years was instructor in chemistry there, and from 1859 to 1864 was professor. Later he developed a process of extracting gold and silver from matte; organized the Boston and Colorado Smelting Company and was made its general manager. Served a term as United States Senator.

HINSDALE, BURKE AARON, LL. D., educator, in Atlanta, Ga., November 29; born in Wadsworth, Ohio, March 31, 1837. At the age of 16 he entered the Eclectic Institute, which afterwards became Hiram College, where he remained the next thirty years of his life as student, professor, or president, and there made the acquaintance of Garfield. He often occupied the pulpit; was an associate editor. After serving as president of Hiram College twelve years he was chosen, on the resignation of W. H. Payne, to the professorship of the art and science of teaching in the University of Michigan, which position he held

until his death. He was a trusted educational leader and the author of a number of important books pertaining chiefly to the history of education.

**HITCHCOCK, HIRAM**, in New York City, December 30; born in Claremont, N. H., August 27, 1832; prepared for Dartmouth College, but by failing health turned aside to become a clerk in the St. Charles Hotel, New Orleans. In 1859, in association with others, opened the Fifth Avenue Hotel, New York. In 1866 he traveled extensively in the East and became interested in archaeological researches. He promoted various learned and scientific bodies, and especially the American school in Athens. He built the hospital for the benefit of Dartmouth College, and also repaired the village church. He was especially active in advancing the interests of the Nicaraguan Canal.

**HOFFMAN, JAMES H.**, in New York City, July 8; born in Sieligenstadt, Bavaria, November 5, 1833; was founder and president of the Hebrew Technical Institute, trustee of the Baron De Hirsch fund, and for more than thirty-five years prominent in Hebrew charities.

**HOWE, EDWARD**, in New York City, November 2; born in Portland, Me., March 8, 1820; graduated at Bowdoin College in 1841. His entire life was given to the study and practice of music, as private instructor, as teacher of music in Union Seminary, and as organist in several of the churches of New York City. His services at the Bethany Presbyterian Church and the Church of the Messiah extended over a period of forty years.

**HUBBARD, OLIVER PAYSON, M. D., LL. D.**, in New York City, March 9; born in Pomfret, Conn., March 31, 1809; graduated at Yale College in 1828. For five years he was assistant of Prof. Benj. Silliman and aided Charles Good-year in his experiments in vulcanizing india rubber until he was appointed professor at Dartmouth, 1836. He continued his medical-school lectures until 1883, when he was made professor emeritus. He supervised the building of the Shattuck Observatory in 1863. From 1867 to 1895 he was one of the overseers of the Thayer School of Engineering. In 1841 he shared in founding the Association of Naturalists and Geologists, and in 1848 the American Association for the Advancement of Science, becoming its secretary and vice-president between 1885 and 1892. He occasionally made contributions to scientific periodicals noted for their accuracy and valuable information. He published the *History of the New Hampshire Medical Institution: the Chandler School; Account of the Seven Nineveh Slabs; sketches of the Yale class of 1828*, of which he was a member; also college memorabilia.

**HUGHES, EDWARD**, in Wales, England, January 22, where he was born. He came to this country in early life, taught five years in Kentucky, and gave to the world the Hughes type-printing instrument for the telegraph.

**HUMPHREYS, FREDERICK, M. D.**, at Monmouth Beach, N. J., July 8; born in Marcellus, N. Y., March 11, 1816; taught three years in Chillicothe, Ohio; was five years itinerant Methodist minister; studied homeopathy, and in 1853 became professor in a homeopathic medical college in Philadelphia.

**HUNTINGTON, COLLIS P.**, near Lake Raquette, N. Y., August 13; born Harwinton, Conn., October 22, 1821; educated in the district school and remained on his father's farm until he was 14, when he started upon an independent career; in 1849 he went to California and engaged in the hardware trade; in 1860, with Leland Stanford, Charles Crocker, and Mark Hopkins, he matured a plan for a transcontinental railway; in 1886 he erected a church in Harwinton as a memorial to his mother, and in 1897 presented the celebrated portrait of Washington, by C. W. Peale, to the Metropolitan Museum of Art; he gave considerable sums to the institute at Hampton, Va., and to Tuskegee (Ala.) Institute \$50,000 in 1899.

- JESSING, REV. JOSEPH, educator, in Columbus, Ohio, November 2, 1899; born in Münster, Westphalia, November 17, 1836; entered the Prussian army at an early age and served in the Schleswig-Holstein war; after coming to the United States he completed the theological course at Mount St. Mary's of the West; was ordained and assigned to the charge of the Sacred Heart Church in Pomeroy, Ohio; he devoted his attention and means to the education and support of homeless orphan boys, and established an orphan asylum at Pomeroy; he afterwards removed to Columbus and set to work to build up the Pontificium Collegium Josephinum de Propaganda Fide.
- KEELER, JAMES EDWARD, Sc. D., astronomer, in San Francisco, Cal., August 12; born in Lasalle, Ill., September 10, 1857; in 1869 he removed with his parents to Mayport, Fla., where he soon began to show a fondness for the study of astronomy; 1875-1877 he had charge of the Mayport Astronomical Observatory in which were a quadrant, a 2-inch telescope, a meridian circle, and a clock; while there he constructed a meridian circle instrument; he graduated from Johns Hopkins University in 1881 and meantime accompanied the United States Naval Observatory expedition under Edward S. Holden that observed the solar eclipse of July 29, 1878, from Central City, Colo.; was appointed assistant at the Allegheny Observatory, Pittsburg, under Samuel P. Langley, whom he accompanied on his expedition to Mount Whitney, California; remained at the observatory two years, then spent a year in Heidelberg and Berlin pursuing higher scientific studies; in 1884 he returned to the Allegheny Observatory and aided Mr. Langley in his work on lunar heat and the infra red portion of the solar spectrum; was appointed assistant to the Lick trustees in 1886 and proceeded to establish a time system, also aiding in the installing of the instruments on Mount Hamilton, California; when the observatory was completed he was appointed astronomer and placed in charge of the spectroscopic work; in 1889 he observed the solar eclipse at Bartlett, Cal., and resigned in 1891 to become the director of the Allegheny Observatory and professor in the Western University of Pennsylvania, where he remained seven years continuing his spectroscopic work; in 1898 he became director of the Mount Hamilton Observatory, which place he held until his death; he received several medals and was greatly honored.
- KINGSBURY, MRS. HELEN B., at Santa Clara, Cal., October 22; born in New York; moved to Michigan in early life; taught to pay her way through Albion College, where she graduated in 1855, during the presidency of Dr. Sinex; taught successfully in Miles and Ann Arbor, and in 1863 accepted a position in Benicia, Cal.; in 1864 was elected preceptress of the Female College at Santa Clara, and became identified with the University of the Pacific, of which she was elected preceptress.
- KNOX, REV. CLARENCE EUGENE, D. D., in Point Pleasant, N. J., April 30; born in Knoxboro, N. Y., December 27, 1833; graduated at Hamilton College in 1856; pastor in Bloomfield, N. J., 1864-73; subsequently became president of the German Theological Seminary.
- KOEHLER, SYLVESTER R., died in Littleton, N. H., September 15; born in Leipsic, Germany, February 11, 1837; wrote extensively on art subjects; was for many years curator of the printing department in the museum of fine arts, Boston, and also of the section of graphic arts in the National Museum at Washington, D. C.; he was a fellow of the American Academy of Arts and Sciences and lectured on engraving and etching; his publications were highly prized.
- LANGLOIS, REV. AUGUSTUS B., in St. Martinville, La., July 31; born in Department of the Rhone, France, April 24, 1832; came to the United States in 1855; finished his education at Mount St. Mary, Cincinnati, Ohio, and was ordained

in 1855; he settled in Louisiana, where he labored thirty years; as a boy he was interested in botany and gathered, in France, an herbarium of 1,200 plants; he renewed his study of the subject in Louisiana and became the leading authority on the flora of this region; he supplied many specimens to the scientific museum; several plants were named for him; his literary works were written in French.

**LAWLER, REV. FRANCIS X.**, in Alexandria, S. Dak., September 10; born in Ireland, January 22, 1822; removed with his parents to New York; studied for the priesthood and was ordained priest in 1845; was vice-president four years and president a like period of St. Mary's College, Marion, Ky.; was two years at Notre Dame, Ind., and later superior of St. Pius Seminary in Kentucky; he served as priest in Indiana and Kansas, from 1859 to 1881, when he went to Dakota where he became superintendent of the Yankton school.

**LEWELLING, EX-GOVERNOR LORENZO D.**, in Arkansas, Kans.; born in Salem, Iowa, December 21, 1846; was an orphan at 9 years; until he was 16 years of age he worked for neighboring farmers and attended the district schools during winters; at the age of 17 he went to Burlington and became a common laborer on the railroad; he was cattle drover and bridge builder in the war for the Union; studied at Knox College, Ill., and Whittier College, Salem, Iowa, where during his last two years he taught to pay his expenses; became a teacher in the reform school; in 1872 he and his wife took charge of the girls department of the reform school which they retained fifteen years; in 1887 he removed to Wichita, Kans., and five years later was elected governor of that State.

**MCCORMICK, LEANDER J.**, in Chicago, Ill., February 20; born in Walnut Grove, Va., February 28, 1819; in 1871 he presented an observatory and a 24-inch refracting telescope to the University of Virginia.

**MCGUIRE, HUNTER**, in Richmond, September 19; born in Winchester, Va., October 11, 1836; graduated at the Winchester Medical College, 1855; was professor of the medical college of his native State, 1856-58, when he removed to Philadelphia; in 1865 he was called to be professor of surgery in the Virginia Medical College, where he remained till 1880; in 1885 was made professor emeritus in that institution; he organized St. Luke's Home for the sick, in Richmond, with a training school for nurses; he wrote on medicine and surgery.

**McMYNN, JOHN G.**, in Madison, Wis., June 5; born at Palatine Bridge, N. Y., July 9, 1824; graduate of Williams College, 1848; taught five years at Kenosha, Wis., and four years at Racine; was colonel of the Tenth Wisconsin Volunteers; in 1865 he built the Racine Academy, which under his direction became a prosperous preparatory school; he was regent of the State University of Wisconsin for twenty-two years, and State Superintendent of Public Instruction for four years, and was also one of the Board of Visitors at West Point.

**MERRITT, DR. SALOME**, in Somerville, Mass., November; born in Templeton, Mass., February 22, 1843; studied in the common schools and Greenwich Academy, Rhode Island; she taught school; graduated in 1874 from the New York Free College for Women, and in 1875 became professor in the same college; in 1876 removed to Boston and remained in the practice of her profession until 1896; she was active in various clubs and other organizations for the promotion of charitable and educational efforts for the physical, intellectual, and moral education of children.

**MERRITT, JOHN WESLEY**, in Concord, N. H.; born May 9, 1808; graduate of Wesleyan University in 1834; in 1837 was elected president of McKendree College, Lebanon, Ill.; after four years resigned and returned East; in 1854 he was elected professor in the Methodist General Biblical Institute, Concord, N. H.

- MITCHELL, Rev. EDWARD C., in New Orleans, March 2; born in East Bridgewater, Me., September 20, 1829; graduated from Colby College; was professor in Shurtleff College at Upper Alton, Ill., and in 1872, when the theological department was transferred to the University of Chicago, he was made professor of Hebrew in that institution; in 1876 he went to London, England, as professor in Regents Park College, serving there two years; in 1878 he established a Baptist theological school in Paris, where he remained four years; in 1883-84 he reorganized the colored schools of the South under Baptist auspices; in 1887 he became president of Leland University, New Orleans, La., where he remained until his death; he published *Principles of Hebrew Grammar* and *Critical Handbook of the Greek New Testament*.
- MONTFORT, R. V. K., in Newburg, December 29; born in Fishkill Village in 1835; graduated from the Albany Medical College in 1856. In September, 1862, he entered the Federal Army as assistant surgeon in the One hundred and twenty-fourth New York Volunteer Infantry. He was present at every engagement of the Army of the Potomac, and was one of the five original officers who served with the regiment during the whole term of service. For forty years he was superintendent of the schools of Newburg.
- MORROW, GEORGE ESPEY, educator, in Paxton, Ill., March 27; born in Cincinnati, Ohio, 1840; served in the civil war as a member of the Second Regiment, Ohio Volunteers. He graduated at the Law Department of the University of Minnesota, 1866; was editor of an agricultural journal 1866-1875. In 1876, was elected president of Iowa Agricultural College. In 1877, he became dean of the College of Agriculture of the University of Illinois, which position he retained until the close of 1896, when he accepted the presidency of the Agricultural College of Oklahoma, where he served till 1897.
- MULHALL, M. G., statistician, December 12; born in 1836. In 1861 he founded the *Buenos Ayres Standard*, the first English daily paper printed in South America. He was a member of the British Association, and in 1884 took part in the Anglo-American Scientific Congress held in Philadelphia. His principal works were the *Dictionary of Statistics*, *The Progress of the World*, and *The Industries and Wealth of Nations*.
- NASH, H. C., at Amherst, December 19; born in Hopkinton, N. H., February 21, 1829; graduated at Amherst College, 1851. From 1851-1854, was teacher at Mount Pleasant Classical Institute, and principal from 1874 to 1877. During this time he fitted some 800 young men for college or for business.
- NORTHRUP, Rev. GEORGE W., in Chicago, December 30; born in Antwerp, N. Y., October 15, 1825; graduate of Williams College, 1854; studied theology in the Rochester Theological Seminary, and for ten years was professor of church history in that institution. He then became professor of systematic theology in the Baptist Theological Seminary at Chicago, and continued there until 1892. His name remained in the list of the faculty of the University of Chicago until his death.
- NORTON, Rev. E. F., Ph. D., in Bath, N. Y., September 23; born in Cortland County, N. Y.; graduated at Yale, 1885; taught at Freehold, N. J., and Morrisville, N. Y., and in 1888 became professor in Olivet College, Michigan, where he remained until 1894; became pastor and preached for a period, when he resumed teaching in the State of New York.
- OLSSON, Rev. OLOF, Ph. D., D. D., in Rock Island, Ill., May 12; born in Sweden, March 31, 1841; was educated at Upsala, Sweden, and entered the ministry of the Lutheran Church in 1863. In 1869 came to Kansas with a number of his people. In 1877 became professor at Augustana College, Rock Island, where he remained until 1888, when his health failing, he resigned. He became pas-

tor in Illinois, and in 1891 was called to the presidency of Augustana College and Theological Seminary.

OTTENDORFER, OSWALD, in New York, December 16; born in Moravia, February 26, 1826; was educated at Vienna and Prague; participated in the revolutionary movement and was condemned to death with Robert Blum, but he escaped and reached this country in 1850. He was employed on the *Staats-Zeitung*, of which, in 1858, he became editor in chief. He gave \$300,000 to build an educational institution in his native town; founded the free library on Second avenue, New York, the Isabella Home for chronic invalids, and the woman's pavilion of the German Hospital.

PADDOCK, ROBERT H., in Detroit, Mich., March 19; born in Woodstock, Vt., February 18, 1814; graduate of Yale, 1837; taught in the Hopkins Grammar School, New Haven, Conn., 1838, and in New York City, 1839-40; graduated in medicine at Castleton, Vt.; 1843-1847 was professor and dean of the faculty of the Willoughby Medical College, Ohio; 1851-1853 was professor at Starling Medical College, Columbus, Ohio, and in 1854-55 professor at Berkshire Medical Institute.

PARK, REV. EDWARDS A., D. D., LL. D., at Andover, Mass., June 4; born in Providence, R. I., December 29, 1808; graduated from Brown University in 1826, and at Andover 1831, and was ordained the same year at Braintree, Mass. In 1833 he became professor at Amherst College; 1836-1847 professor at Andover. In 1847 was appointed professor of Christian theology at Andover, which chair he held until 1881, when he was elected professor emeritus. He was one of the founders of the *Bibliotheca Sacra*, of which he was editor from 1871 to 1884. He was distinguished both as a preacher and a writer on theological subjects.

PARKER, HORACE, at Eliot, Me., December 11; born at Kittery, Me., November 16, 1815; graduated at Bowdoin, 1845. After graduation taught two years at Eliot Academy; was then purser twelve years in the United States Navy. He again taught in Eliot, 1860-1880; was principal of York County Free High School, and for nine years was superintendent of the Eliot schools.

PARKS, JOHN R., at Salt Lake City, September 29; was for a time president of the Utah University and died greatly lamented in the midst of his official term as State superintendent of schools. Several of the leading towns of the State honored him with special commemorative services.

PARR, S. S., St. Cloud, Minn., February 23; born in Dell Roy, Ohio, 1848; graduate of State normal school, Terre Haute, Ind.; was school superintendent, Marshall, Ill., 1872-1874; teacher in high school, Indianapolis, 1875-76; 1876-1881 teacher in normal school, Terre Haute. The next four years he was in educational work in Minnesota and edited School Education; 1885-1889 dean of normal department De Pauw University; was appointed superintendent of schools in St. Cloud, which position he held until his death.

PARSONS, DAVID, at Del Ray, Mich.; born in Oswego County, N. Y.; educated in the common schools and at the Regents Academy, Oswego County, N. Y.; began teaching at 16 years of age; was one of the founders of the Ohio State Teachers' Institute, of a normal school in Ohio, and of the Tafton Collegiate Seminary of Wisconsin. In 1864 he aided in grading the schools of Dubuque, Iowa, and subsequently aided in the development of the public schools of Freeport, Ill.

PARSONS, JAMES, in Philadelphia, March 21; born near Savannah, Ga., 1835; removed to Philadelphia, 1877; was engaged in the general practice of law, and for more than thirty years was professor in law school of Pennsylvania University and a well-known legal writer.

PATRICK, JOHN B., at Anderson, S. C., August 30; born in Barnwell County, S. C.; graduated at South Carolina Military Academy, 1855; 1856 became tutor in Furman University; in 1858 was professor at South Carolina Military Academy; was in the Confederate service during the civil war, and in 1866 became principal of the Furman University preparatory department; in 1869 resigned to take charge of the Peabody School at Greenville; in 1878 he organized the Greenville High School, changing the name to Greenville Military Institute and then to Patrick Military Institute.

PERKINS, Miss GRACE H., in Somerville, Mass., in April; born in Exeter, N. H.; graduated at Wellesley, 1894; taught four years in Arlington High School, and then became teacher in the Boston High School.

PHELPS, E. J., LL. D., diplomat, in New Haven, Conn., March 9; born in Middlebury, Vt., July 11, 1822; graduate of Middlebury College, 1840; taught school in Virginia; after studying a year at Yale Law School was admitted to the bar in 1843; practiced law in Middlebury; in 1851 became Second Comptroller of the United States Treasury; afterwards returned to Burlington, Vt., continuing his general practice and residence at Burlington; was professor in Yale Law School, 1881-1885, and also lecturer on constitutional law in Boston University; in 1885 he was sent as United States minister to England, where he remained four years; in 1893 he served in the Bering Sea court of arbitration, and on his return to this country resumed his chair at Yale Law School.

PIERCE, MOSES, in Norwich, Conn. He gave \$100,000 to the American Missionary Society, New York City, to be known as the Edward Milburn Pierce fund, to be used for the education of colored common-school teachers in the South; another \$100,000 was bequeathed in ten equal parts for the Norwich Free Academy, and \$30,000 for the Rock Nook Childrens' Home, which he founded twenty years ago.

PORTER, Miss SARAH E., teacher in Farmington, Conn., February 18, where she was born August 17, 1813. She was a sister of President Noah Porter, of Yale College. She began her life work with a small day school for girls, which grew into a large seminary and attracted students from all parts of the United States.

PUTNAM, GRANVILLE B., in West Newton, Mass., March 9; born in Danvers, Mass., August 27, 1835; graduated from the Bridgewater Normal School and immediately began to teach. He afterwards graduated at Amherst College in 1861; in 1864 became submaster in the Bigelow School, Boston, and later master of the Franklin School, where he remained until his retirement. He was associate editor, with Professors Hagar and Kneeland, of the Massachusetts Teacher, and wrote for the New England Magazine, Youths' Companion, Wide Awake, Education, and other publications.

RAMBAUT, Mrs. MARY L. BONNEY, at Hamilton, N. Y., June 8; born in 1816; graduated at the Troy Female Seminary in 1835. In 1850 she founded the Chestnut Street Female Seminary in Philadelphia. In 1883 the school was moved to Ogontz and became known as the Ogontz School for Young Ladies. In 1888 Mrs. Rambaut retired from the active management of the school. In 1879 she became deeply interested in the Indians and started a movement for their support that ended in the Woman's National Indian Association. She sent out 7,000 copies of a petition protesting against the contemplated encroachments of white settlers upon the Indian Territory, which petition was circulated in fifteen States and resulted in a memorial which was forwarded to the White House, November 14, 1880, and subsequently presented to the House of Representatives. This memorial led to the Dawes Indian severalty bill.

- RIDPATH, J. CLARK, historian, in New York City, July 31; born in Putnam County, Ind., April 26, 1841; graduated at Asbury, now De Pauw, University in 1863. Taught in his senior year in Thorntown Academy, Indiana, and after graduating was made its principal. In 1866 was elected superintendent of public schools, Lawrenceburg, Ind., and from 1869 to 1885 was professor in his alma mater, and vice-president of the university from 1879. After resigning his professorship he devoted himself to literary work and wrote a number of books.
- RIPLEY, ERASTUS L., in Kansas City, September 11; born in Weybridge, Vt., February 14, 1822; graduate of Yale 1850. For seven years was principal of the public schools in Jackson, Mich., and for about the same length of time was professor in the Michigan State Normal School. In 1867 became principal of the college of normal instruction in the University of Missouri. He wrote and published a number of text-books.
- ROBERTS, B. W., in Cambridge, Mass., June 27; born in 1817; he taught school more than fifty years.
- ROGERS, FAIRMAN, civil engineer, in Vienna, Austria, August 23; born in Philadelphia, November 15, 1833; graduate of the University of Pennsylvania in 1853. While in college devoted himself especially to mathematics and mechanics and on graduation was appointed lecturer on mechanics in Franklin Institute, which place he held until 1865. From 1865-1871 he was professor of civil engineering in the University of Pennsylvania; 1871-1886 was trustee of the university; in 1878 gave the university a large library of works on engineering. At the beginning of the civil war was a member of the First Troop, Philadelphia City Cavalry, and was for a time its commander. Later served as volunteer engineer officer. Under the auspices of the United States Coast Survey he completed the survey of the Potomac River northward from Blakiston Island; was for many years manager of the Pennsylvania Academy of Fine Arts, and was one of a committee in charge of the exhibition building at the Centennial Exposition in Philadelphia. He wrote a number of scientific books.
- SACHTLEBEN, AUGUST, in Charleston, S. C., January 11; born in Brunswick, Germany, March 5, 1824; graduated at Marburg University. When only 19 years of age he came to Charleston and was engaged as teacher of the classics in Coates Academy. During the war he taught in Columbia, S. C. Soon after the war he returned to Germany. From Germany he was recalled to South Carolina and appointed professor of modern languages in the University of South Carolina. While there he wrote the work by which he will be best remembered. "The Seven against Thebes." When colored students were admitted to the university he resigned his position and returned to Charleston, where he opened a private school. Was subsequently elected professor in the College of Charleston, where he remained until two years before his death, when he resigned on account of failing health.
- SAYRE, LEWIS A., M. D., in New York City, September 21; born in Madison, N. J., February 29, 1820; graduated at Transylvania University, Kentucky, in 1837, and at the College of Physicians and Surgeons of New York, 1842. The office of prosecutor to Dr. Willard Parker, professor of surgery in that institution, was at once given him, which position he held until made emeritus prosecutor in 1852; 1853-1873 was surgeon at Bellevue Hospital; 1859 surgeon at Charity Hospital on Blackwells Island; was one of the active founders of Bellevue Hospital Medical College in 1861, and was made its professor of orthopedic surgery, which chair he retained until the college was consolidated

with the New York University, when he was made emeritus professor. He was the first American to remove the head of the femur in hip-joint disease. In 1876 he was sent by the American Medical Association as delegate to the International Medical Congress in Philadelphia, and in 1877 to the British Medical Association. In 1872 was made a knight of the Order of Wasa by Charles XIV, of Sweden and Norway, for his services to medical science. He invented many surgical appliances.

SCOVILLE, JOHN F., educator, in Brooklyn, N. Y., March 25; born in Sandy Hill, N. Y., May 9, 1812; graduated at Yale in 1832, and in 1833 became the first president of Oberlin.

SEYMOUR, Rev. C. H., D. D., in South Groveland, Mass., November 19; born in Watertown, Conn., 1829; was a graduate of Trinity College, Hartford. In 1850 was professor in Hamden Military School and in 1857 established a similar school in West Hartford. In 1854 he established the Wolcott School at Litchfield, Conn. In 1855 he was chosen principal of the Pynchard Free School at Andover. In 1868 he went to Dubuque, Iowa, and later became president of Griswold College, Davenport, Iowa.

SHAKESPEARE, E. O., M. D., in Philadelphia, June 1; born at Dover, Del., in 1846; graduate of Dickinson College, Carlisle, Pa., in 1867; studied medicine at the University of Pennsylvania; was especially commissioned by President Cleveland in 1885 to investigate causes and condition under which Asiatic cholera thrives in Europe and India, and spent a year in that work.

SHELDON, WILLIAM E., in Boston, Mass., April 16; born in Dorset, Vt., in 1832; graduate of Middlebury College, Vermont; 1865 was the master of Hancock School of Boston, also taught in the New Britain, Conn., normal school and in schools in North and East Abington. Subsequently he engaged in journalism, and was assistant to A. E. Winship in editing and publishing *The Primary Teacher* and *The Journal of Education*. He was one of the organizers of the National Educational Association, and its president one year.

SHELLEY, WILLIAM H., near Penmar, Md., August 12; born on Hill Island, on the Susquehanna, in 1840; studied at Dickinson College, Carlisle, Pa.; began teaching in Lancaster County, Pa., and taught several years in Columbia and York counties, and for five years was professor in Albion College, Mich. In 1870 was elected the first superintendent of schools in York, Pa., and held the office for many years, grading the schools and establishing the high school; for a time was connected with the Woman's College of Baltimore, and later elected principal of the Girl's Latin School of that city, which position he held until his death.

SILCOX, Miss JULIA C., in Cleveland, Ohio, in August; born in Portsmouth, Ohio, in the year 1857. Occupied several positions in the Cleveland schools during her nineteen years of successful service.

SKENE, ALEXANDER J. C., M. D., in Highmount, N. Y., July 4; born in Fyvie, Scotland, June 17, 1837; graduated at the Long Island College Hospital in 1863; was surgeon in the Army 1863-64. He devised a scheme for a hospital corps which is now in use in the Army and the National Guard; in 1864 was appointed adjunct professor in the Long Island College Hospital; in 1872 was made professor of gynecology, and in 1886 became dean of the faculty of that institution. He wrote many medical works.

SMART, JAMES H., LL. D., in Lafayette, Ind., February 21; born in Center Harbor, N. H., June 30, 1841; was educated chiefly at the high school, Concord, N. H.; 1859-1863 taught in New Hampshire schools; 1863-1865 was principal of the intermediate school in Toledo, Ohio; 1865-1875 was superintendent of schools

in Fort Wayne, Ind. For six years was State superintendent of schools for Indiana. In 1883 became president of Purdue University and so remained until his death. For twenty-seven years was member of the Indiana State board of education. In 1870 was one of the United States commissioners to the Paris Exposition and for two years was assistant commissioner for Indiana to the Vienna Exposition. In 1881 was president of the National Educational Association, and in 1891 was appointed United States commissioner to the International Agricultural Congress at The Hague. He was the author of various reports and several books on educational topics.

SMITH, GEORGE W., at Winchendon, Mass., in February; born in 1862; graduated at Colby; was professor at Johns Hopkins, and was elected president of Colgate University, July 2, 1895.

SMITH, THOMAS SNELL, in Easthampton, Mass., December 17; graduated at Amherst College in 1866; after graduation was teacher in Williston Seminary; graduated at Bangor Theological Seminary in 1869. In the service of the American Board of Missions he was sent to the island of Ceylon and became there manager of the Jaffna board of education and was also in charge of the medical department until 1881; was principal of the Tillipally English Normal and Industrial School. For fifteen years he was in charge of other schools and of the general educational work in one of the missionary districts, comprising more than a hundred schools, attended by from eight to ten thousand children.

SMITH, WILLIAM MANLIUS, in Syracuse, May 4; born in Manlius, N. Y., September 26, 1823; graduate of Yale, 1844; was teacher in Manlius, 1846-47; studied and received M. D. at Pennsylvania University, 1849; practiced in Manlius. During the winter of 1872-73 lectured in New York College; 1877 was professor in Syracuse University.

STALLO, JOHN BERNHARD, lawyer, in Rome, Italy, January 6; born in Sierhausen, Oldenburg, March 16, 1823; came to the United States in 1839; taught in a private school in Cincinnati, and later was professor in St. John's College, Fordham, N. Y.; studied law, and was admitted to the bar 1849; served two years as judge of the court of common pleas. This position he resigned to resume his law practice. In 1885 he was appointed minister to Italy, which post he filled until 1889. His published works include *General Principles of the Philosophy of Nature*, *Concepts and Theories of Modern Physics*, *Abhandlungen und Briefe*; was a strong advocate of the retention of the Bible in the public schools.

STILLÉ, ALFRED, M. D., LL. D., in Philadelphia, September 24; born there October 30, 1813; graduated at the University of Pennsylvania 1832, and at the medical department in 1836; studied in Europe; returned to Philadelphia; became prominent as a physician; 1854-1859 was professor in Pennsylvania Medical College. He occupied the same chair in the University of Pennsylvania 1864-1884; 1865-1871 was also lecturer on clinical medicine; was active in the formation of the Medical Association, and was a writer of authority on medical subjects.

STOCKWELL, Rev. AUSTIN PARSONS, in Brooklyn, N. Y., November 21; born in Hadley, Mass., December 2, 1837; graduated at Amherst 1862; graduated in theology at Union Seminary in 1865; was superintendent of the industrial schools connected with the Children's Aid Society in Brooklyn from 1887 to 1893, and from 1893 to 1899 was superintendent of the Howard Mission, New York City.

- TALBOT, EMILY (FAIRBANKS), in Holderness, N. H., October 29, 1900; born in Winthrop, Me., February 22, 1834. Taught in Augusta, Me., and Baltimore, Md.; married Dr. I. T. Talbot, of Boston, 1856. She was one of the organizers of the Massachusetts Society for the University Education of Women; founder of the Association of Collegiate Alumnae; secretary of the education department of the American Social Science Association; secretary and one of the founders of the Round Table Club of Boston; an active leader in the movement which resulted in the establishment of the Boston Girls' Latin School.
- TUPPER, REV. HENRY MARTYN, in Ormond, Fla., September 12; born at Hardwick, Mass., June 10, 1830; graduated at Yale 1850; taught in Monson Academy, Massachusetts, and in Gates County, N. C.; also in Illinois College and in Griggsville, Ill.; studied theology and was licensed in 1866, and was successful in his various pastorates.
- TYLER, REV. MOSES COIT, LL. D., L. H. D., in Ithaca, December 28; born in Griswold, Conn., August 2, 1835; graduated at Yale in 1857; studied theology at Yale Divinity School and at Andover; in 1862, on account of ill health, gave up preaching; spent four years in England in literary pursuits, and during that time was a regular correspondent of *The Nation*; in 1867-1881 was professor in the University of Michigan; 1873-74 was also literary editor of the *Christian Union*; from 1881 to his death was professor in Cornell University. He was widely known for his literary works.
- WEST, C. E., LL. D., in Brooklyn, N. Y., March 16; born in Washington, Mass., February 23, 1809; began teaching school when he was 18 years old; was specially devoted to the higher education of woman. He taught in Buffalo, and in 1876 established his school, the Brooklyn Heights Seminary, where he continued in charge from 1859 to 1889, the enrollment increasing to 600.
- WHITE, MOSES CLARK, in New Haven, October 24; born July 24, 1819, in Oneida County, N. Y.; received his M. D. at Yale; was missionary to China; instructor in Sheffield Scientific School 1861-1864, and in Yale Medical School 1862-1867; later was professor at Wesleyan University. He was recognized as an authority in medical jurisprudence.
- WHITMORE, N. McLELLAN, in Gardiner, Me., February 26; born in Bowdoinham, Me., October 1, 1812; graduate of Bowdoin College, 1833; was instructor in the United States Navy one year; two years principal of Monmouth Academy, and of Waterville Institute an equal period; in 1838 was admitted to the bar.
- WILLIAMS, S. G., at Ithaca, N. Y., May 9; born near Winfield, N. Y., 1827; graduate of Hamilton College, 1852; was principal of Groton Academy, Seneca Falls Academy, N. Y., and the Central High School of Cleveland, Ohio; in 1879 was elected professor of geology in Cornell University, and in 1886 became professor of pedagogy in the same institution; in 1898 he resigned and was made professor emeritus. He was the author of various publications, mainly on geology and pedagogy.
- WILLIAMS, THOMAS A., botanist, in Takoma Park, D. C., December 23; born in Fremont County, Iowa, November 25, 1865; graduated at the University of Nebraska in 1889, and engaged in teaching; in February, 1891, he was appointed assistant in Dakota Agricultural College, where he remained six years, and for two years held a similar position in Columbian University, Washington, D. C. In 1896 he became assistant in the Agricultural Department at Washington, and edited the *Asa Gray Bulletin*.
- WILSON, WILLIAM L., LL. D., educator, in Lexington, Va., October 17; born in Jefferson County, Va., May 3, 1843; graduated at Columbian College, Washington, D. C., in 1860; served as private in the Virginia cavalry; from 1865 to

1871 was professor in Columbian College; was admitted to the bar in 1866; in 1882 was elected president of the University of West Virginia, and the same month was elected to Congress, and resigned from the University; was five times reelected to Congress; in 1895 was made Postmaster-General, which position he held two years; in 1897 was made president of Washington and Lee University, which position he held until his death; for three years was one of the Regents of the Smithsonian Institution.

YERBY, JOHN D., in Mobile, Ala., August 10; born in Greensboro, Ala.; was a successful teacher in that city, and for five years superintendent of the city schools.

## 1901.

ABBOTT, CHAS. R., in Brooklyn, January 20. Was a teacher four years in Westchester, N. Y., then in grammar school in New York City; from 1859 to 1862 principal of Farnum Preparatory School, Beverly, N. J. From 1862 to 1869 was superintendent of schools in Kingston, N. Y. Became principal of grammar school in Brooklyn in 1869, and remained in that position until his death. Was one of the oldest teachers in that region.

ADAMS, HERBERT BAXTER, in Amherst, Mass., July 30; born in Shutesbury, Mass., April 16, 1850. Graduated at Amherst in 1872. In 1873 taught Latin and Greek in Williston Seminary. The next three years were spent in study in Europe. In 1876 he received the degree of Ph. D. from Heidelberg University. From 1876 to 1878 was a fellow in history at Johns Hopkins University. Was lecturer in history at Smith College from 1878 to 1881. Was trustee of Amherst College and of the Country School for Boys, Baltimore. Subsequent to 1887 was the editor of the Contributions to American Educational History of the United States Bureau of Education. Was the editor of the Johns Hopkins University Studies in Historical and Political Science, and the author of the Life and Writings of Jared Sparks, and of numerous historical and educational monographs. Was associate professor and professor of history at Johns Hopkins University from 1878 until his death.

ALEXANDER, JOHN E., January 21, in Monmouth, Ill.; born in Middletown, Frederick County, Md., March 4, 1833. Graduate of Franklin and Marshall College in 1853. In 1853-54 was professor of English in Landon Military Academy, Maryland. In 1857-58 was principal of the female seminary at Mercersburg, Pa. Studied law in Illinois and practiced his profession until 1900, when his health failed. Was for fourteen years secretary of board of trustees of Monmouth College, and was one of the founders of the Warren County Library and a member of the board of directors.

ALEXANDER, ROBERT, in Philadelphia, February 27; born in Belmont County, Ohio, in 1837. Graduated at Washington College, Washington, Pa., in 1855, and afterwards studied theology at Princeton and Edinburgh. Was pastor of First Presbyterian Church, St. Clairsville, Ohio, for thirty-two years. He was greatly interested in the educational work of the Presbyterian Church, and was for many years trustee of Washington and Jefferson College, and director of the Western Theological Seminary in Allegheny, Pa.

ALEXANDER, W. S., D. D., in Cambridge, Mass., May 15; born in Killingly, Conn., in 1835; graduated at Yale in 1858 and at Andover Theological Seminary in 1861; was pastor of a church in Pomfret, Conn., and also in Racine, Wis.; was many years a missionary in Italy and in the South. He was president of Straight University, New Orleans, for some years.

ALLEN, SIMEON OLMSTED, in West Springfield, Mass., April 22; born December 23, 1837, at Enfield, Conn. Graduated at Yale in 1865; studied at Yale Divinity School, from which he received the degree of B. D. in 1868, and was licensed to preach in June of that year. Was professor of mathematics at Olivet College.

ARMOUR, PHILIP D., in Chicago, Ill., January 6; born in Stockbridge, N. Y., May 16, 1832. He grew up in the country and was educated in the district school and at Cazenovia Academy, New York. In 1852 he started for the gold fields of California, traveling overland with three or four young companions, walking much of the way. He made several thousand dollars soon after reaching California by developing ditches to supply water for placer mining, and in 1856 he returned home with a fortune. Shortly thereafter he went West and with a brother-in-law established a large wholesale grocery house in Milwaukee. In this he was also successful, and in a year's time purchased the largest grain elevator in Milwaukee, then more elevators, and other property. He afterwards went to Chicago to take charge of a New York packing establishment, which soon came to be the largest packing and provision house in the world. The property interests for which Mr. Armour stood are estimated at \$150,000,000. His personal share in this property is variously estimated at from \$25,000,000 to \$50,000,000. Of his many charities the most noted were the Armour Mission, the Armour Flats, and the Armour Institute, all in Chicago. The Mission was established by a bequest of \$100,000 by Joseph Armour, which was more than doubled by Philip, his executor. The Armour Institute was established at an original cost of \$1,500,000, to which sum Mr. Armour, in 1899, added \$750,000.

ARMS, JESUP ADAMS, in Providence, R. I., March 9; born June 9, 1841, in Norwich, Conn. He left Yale College for the Army and received his degree later, in 1875; became regimental adjutant in 1862. In 1863 was captain on the staff of General Hartranft; was admitted to the bar in 1866; was editorial writer on the Philadelphia Times, also on the Examiner and Express, of Lancaster, Pa. In 1876 was appointed colonel on the staff of Governor Hartranft. In 1894 he represented the town of East Greenwich in the State senate. He was at one time superintendent of the public schools and president of the Free Library.

ASH, GEORGE WASHINGTON, in Kirkwood, Ill., March 5; born at Putney, Vt., December 31, 1808. Graduated from Amherst College in 1839 and from Andover Seminary in 1842. Was pastor at Halifax, Vt., and Westmoreland, N. H., also at Salisboro, N. H. Taught in various places in the South and West. Was principal of Washington Seminary, Richview, Ill., from 1869 to 1871; professor of languages at the Illinois Agricultural College, Irvington, Ill., from 1873 to 1875.

ATKINSON, WILLIAM R., in Williamsport, Pa., March 5; born in Alabama. Was a student at the South Carolina College, and left his studies to enter the Confederate Army. At the close of the war went to Virginia University. Taught school in Abbeville County. Studied for the Episcopal ministry; was appointed chaplain of the Virginia University; taught in Raleigh. Later took charge of the Charlotte Female College, where he achieved great success. In 1890 founded the Presbyterian College for Women in Columbia, South Carolina, which under his administration attained a high reputation.

BACON, CHARLES A., in Beloit, Wis., November 6; born in Brattleboro, Vt., in 1860. Graduate of Dartmouth College in 1883. In 1883-84 was instructor in science and mathematics in Hallowell Classical Academy, Maine. In 1884-85 taught in Wakefield, Mass. In 1885 he took charge of the new Smith Observatory at

Beloit College, where he spent several years in study and observation. He was a brilliant mathematician and astronomer, and his discussions of meteoric showers, sun spots, and eclipses gave him a wide reputation. For six years he had been physically helpless, but continued to teach his classes until his death.

BANCROFT, CECIL FRANKLIN PATCH, in Andover, Mass., October 4; born in New Ipswich, N. H., November 25, 1839. Graduate of Dartmouth College in 1860 and of Andover Theological Seminary in 1867. From 1860 to 1864 was principal of an academy at Mount Vernon, N. H. He studied at the University of Halle, Germany, and late in 1867 became principal of Lookout Mountain Educational Institution in Tennessee, where he remained till 1872. He was ordained in the Congregational ministry May 1, 1867, but never became a pastor. In 1873 became principal of Phillips Academy, Andover, Mass., where he remained until his death. He received the degree of Ph. D. from the University of the State of New York in 1874, that of Litt. D. from Williams College in 1891, and that of LL. D. from Yale in 1892. He was trustee of Andover Theological Seminary, and after 1897 of Dartmouth, and was active in many other educational, religious, and charitable institutions. He gave many addresses and wrote much for the periodical press on religious and educational subjects. At Phillips Academy he trained nearly 5,000 young men, fitting for college a larger number than have been prepared by any other principal or preparatory school in this country.

BARBOUR, VOLNEY G., in Minneapolis, Minn., June 4; born in Canton, Conn., June 2, 1842. Graduated at Yale in 1867. In 1868 was assistant in engineering at the Sheffield Scientific School. In 1869 was called to the professorship of civil engineering in the University of Vermont at Burlington, and filled that chair for thirty-one years; was also superintendent of the buildings and grounds. From 1886 to 1888 was special professor of sanitary science in the medical department of the university. Was city engineer of Burlington from 1871 to 1874, also in 1885-86. Was school commissioner from 1896 to 1900. For many years was director of the Mary Fletcher Hospital. Was a member of the Congregational Church, and served as private throughout the civil war.

BARKER, EDMUND PLUMMER, in Worcester, Mass., October 31; born in Mystic Conn., November 21, 1850. Graduated at Amherst College in 1876. He was principal of Deerfield Academy from 1876 to 1878; of Nichols Academy, Dudley, from 1878 to 1880; of Hopkins Academy from 1880 to 1883, and of Swampscott High School, all in Massachusetts. In 1890 was appointed superintendent of schools of the district which embraced Ayer, Littleton, and Westford, and a part of the time Harvard and Pepperell, which office he filled very acceptably until 1898, when ill health compelled his retirement. His school reports were valuable as historical and educational works. He was the founder of the Ayer Citizens' Course of Lectures, now known as the Ayer Lyceum.

BARNES, JEREMIAH ROOT, in Marietta, Ohio, January 1; born in Southington, Conn., March 9, 1809. Graduated at Yale College in 1834. Studied two years in Yale Theological Seminary. Was pastor in Evansville and Salem, Ind. In 1840 was financial agent for Marietta College. He preached eighteen months at Piqua, Ohio. In 1850 he established a young ladies' seminary in the suburbs of Cincinnati, and at the same time published the Western Magazine. He was one of the founders of Carleton College in Northfield, Minn. From 1861 until the close of the war was in the Freedmen's Bureau. He assisted in the preparation of Olney's Geography. In 1892 Yale conferred on him the honorary degree of M. A.

BARTLETT, G. M., in Knoxville, Tenn., October 23, aged 81 years. He was for twenty-one years president of Maryville College, Tennessee.

BATTERSON, JAMES GOODWIN, at Hartford, Conn., September 18; born in Bloomfield, Conn., February 23, 1823. At the age of 16 went to Ithaca as an apprentice in a printing house. During this service he began to fit himself for college, and later studied law, but the necessity for earning a livelihood became pressing and he abandoned this study and entered the employ of his father, who was a stone mason. He later became a manufacturer of monuments. In 1857 he constructed the Worth monument in New York City. He was president of the New England Granite Company. He invented a lathe for turning out granite columns. He erected the national monument at Gettysburg, the statue to Alexander Hamilton in Central Park, New York, and other noted memorials. He constructed the Masonic Temple and many great office buildings in New York, and the city hall of Providence. He will, however, be best remembered as the constructor of the Congressional Library at Washington and the State capitol at Hartford. He was founder and president of the Travelers' Insurance Company, and was called the father of accident insurance. He devoted much time to languages and geology. In the winter of 1858-59 he was in Egypt with the great engineer, Brunel. He became an authority on Egyptology and was appointed honorary secretary of the Egyptian exploration fund. He devoted many months to art while in Europe, and presented many rare and valuable paintings to the museums of Philadelphia and Hartford. He wrote essays on labor and capital, on taxation, and on scientific subjects. He also wrote poetry, and excited admiration by the felicity of some of his translations from the Iliad. In Greek and Latin he was more than proficient, and received the degree of A. M. from Yale and Williams. He was director of the Hartford National Bank, trustee of Brown University, and was a member of a number of societies—literary, historic, and scientific.

BEAMAN, WARREN HARRISON, in Amherst, Mass., February 26; born in Wendell, Mass., January 7, 1813. Graduate of Amherst College in 1837. Studied theology, and for thirty-one years was pastor at Hadley, Mass. For twenty-eight years was a member of board of trustees of Hopkins Academy, Hadley. From 1876 to 1884 was superintendent of schools at Hadley.

BELKNAP, CHARLES, in Baltimore, Md., June 15; born in Jersey City, August 26, 1846. Was appointed to the Naval Academy in 1864. Received his commission as ensign in 1868. Became commander December 6, 1896. Was one of the most efficient officers of the Navy. Was three times instructor in physics and chemistry, and later torpedo instructor at the Naval Academy. Was assigned to the command of the training ship *Dirie* December 4, 1899.

BENTON, GEORGE HENRY, in Minneapolis, November 16; born July 20, 1853, in Syria, Asia. Graduate of Yale in 1875. Professor in Little Rock, Ark. Last part of his life engaged in railroad service.

BILLINGS, SANFORD WATERS, in Sharon, Mass., December 30; born in Sharon, October 3, 1834; graduate of Amherst College in 1859. He was a teacher for more than thirty years. Taught a district school in his native town two years, when he organized the Stoughtonham Institute and was its principal for fifteen years. From 1878 to 1891 was principal of the Sharon High School; resigned to become superintendent of schools of the Provincetown-Harwich district, which office he filled with credit for two years; was four years member of the Norfolk County Teachers' Association, and president several terms; was town treasurer and trustee of the public library; was a member of the State legislature, and largely instrumental in securing the passage of the first Massachusetts free text-book law; was editor of the Sharon News.

BLISS, CHARLES ROBINSON, at Longmeadow, Mass., February 26; born there November 5, 1828; graduate of Williams College in 1854, and of Andover in 1858; preached four years in Beverly, and fifteen years in Wakefield, Mass. Declining health caused him to remove to Colorado, where he aided President Tenney in building up Colorado College; he also established preparatory academies in Utah and New Mexico; was professor in Colorado College; was made secretary of the New West Education Commission, and was editorial secretary of the Congregational Education Society.

BOLTON, CHARLES EDWARD, in East Cleveland, Ohio, October 23; born in South Hadley Falls, Mass., May 16, 1841; graduate of Amherst College in 1865. After graduation became manager of Hall's Safe and Lock Company for northern Ohio; was for some years vice-president and manager of the Cleveland Machine Company. He patented in this country and Europe several practical inventions. In the panic of 1873 he sustained very heavy losses, but instead of taking advantage of the bankruptcy laws he devoted himself for nearly twenty years to the work of paying his debts. He delivered more than 2,000 illustrated lectures, chiefly on subjects connected with his travels. In 1892 he engaged in real estate business and made a success of it. His study of wage-earners and his interest in them led him to establish the Cleveland Educational Bureau, which for several winters, in the tabernacle, each Saturday night, gave to large audiences educational entertainments of interest and profit. Talks were given by Mr. Bolton in 150 workshops of the city. He was several times mayor of East Cleveland. He published a few Civic Problems of Greater Cleveland, and a Model Village and Other Papers.

BRADBURY, JAMES WARE, in Augusta, Me., January 6; born in Parsonsfield, Me., June 10, 1802. Graduate of Bowdoin College in 1825. Was principal of Hallowell Academy for a year. For several months conducted a school for the instruction of teachers. He studied law, was admitted to the bar in 1829, and practiced his profession in Augusta. Was county attorney in 1835, delegate to the Baltimore convention of 1844, and in 1846 was chosen United States Senator from Maine. He was chosen overseer of Bowdoin College in 1850 and trustee in 1860. He received the degree of LL. D. from Bowdoin in 1872.

BROCKWAY, FRED JOHN, in Brattleboro, Vt., April 21; born in Sutton, N. H., February 24, 1860. He received the degree of M. D. in New York in 1887. Was two years in Roosevelt and Johns Hopkins hospitals. Was instructor in the College of Physicians and Surgeons, New York. Was author of Chemistry and Physics and a Compend of Anatomy.

BURLESON, RUFUS C., in Waco, Tex., May 13; born August 7, 1823, near Decatur, Ala. President of Baylor University at Independence, Tex., from 1853 to 1861, when he removed to Waco and established a coeducational school known as Waco University. Waco and Baylor were consolidated into Baylor University in 1885, Dr. Burleson being its president until 1897.

BURNHAM, MISS SARAH M., in Cambridge, Mass., August 24; born in Chester, Vt., 1819. Taught in the public schools of Cambridge from 1843 to 1879. Published various works.

BURROUGHS, GEORGE STOCKTON, D. D., LL. D., in Clifton Springs, N. Y., October 22; born in Waterloo, N. Y., January 6, 1855. Graduate of Princeton in 1873 and of Princeton Theological Seminary in 1877. Professor at Amherst from 1886 to 1892, when he became president of Wabash College, and after retiring from that office accepted the chair of Old Testament language and literature at Oberlin.

- CAPEN, EDWARD, in Haverhill, Mass., October 20; born in Dorchester, Mass., October 20, 1821. Graduate of Harvard in 1843 and of Cambridge Divinity School in 1845. Was secretary of the Boston school board and librarian of the public libraries in Boston and Haverhill for forty-seven years, and was at the time of retiring the oldest librarian in the State.
- CHASE, MILTON, in Boston, May 19; born in Haverhill, Mass., July 13, 1832. Graduate of Dartmouth in 1856. Read law, taught in the Lowell high school. Was principal of the Adams school in Dorchester, Mass., from 1857 to 1864. Later was in charge of the Davis school in Newton for two years. In 1866 became master of Dudley's boys' school in Boston, where he remained until 1901.
- CHITTENDEN, ALBERT JEROME, in New Marlboro, Mass., February 4; born in Westbrook, Conn., July 26, 1838. Graduate of Ripon College, Wis., in 1868, and of Chicago Theological Seminary in 1874. Was nominated superintendent of public instruction. Taught in Wheaton College, Ill. Engaged in educational work in the South. Was author of several works.
- CLARKE, STEPHEN WATKINS, March 13, at Spencerport, N. Y.; born in Naples, N. Y., April 24, 1810. Graduate of Amherst in 1837. Taught in Groton, N. Y., and elsewhere. Published several works on grammar and language.
- COGSWELL, GEORGE, in Bradford, Mass., April 21; born in Atkinson, N. H., February 8, 1808. Graduate of Dartmouth Medical College in 1830. Was for fifty years trustee of Bradford Academy. Received his A. M. degree from Dartmouth. Was eminent in his profession and in his general relations to the public.
- COOK, JOSEPH, in Ticonderoga, N. Y., June 24; born in the same town January 26, 1838. He studied at Keeseville, N. Y., and at Phillips Academy, and at Yale from 1858 to 1861, when illness interrupted his studies; later he entered Harvard as a junior, and graduated in 1865. Took the full course and a two years' post-graduate course at Andover Theological Seminary. Supplied several pulpits. Studied at Halle, Leipsic, Berlin, and Heidelberg, also traveled in Egypt, Syria, and Europe. In 1874, while residing in Boston, began giving his well-known Monday lectures, which continued through several seasons before large audiences. From 1880 to 1882 he was engaged in making a tour of Great Britain, India, Japan, and Australia, and in a journey of more than two years averaged more than one address on every other working day while on land. In 1895, on a second tour of the world, with his wife, he was interrupted by sudden illness in Australia. His last public appearance was at Haverhill, March 20, 1901. Was made LL. D. by Harvard in 1892. Was a member of the Victoria Institute, London. He published *Biology, Transcendentalism, Orthodoxy, Conscience, Heredity, Marriage, Labor, Socialism, Occident, Religious Perils, and Defenses of the Lord's Day*. He edited *Our Day* from 1888 to 1895.
- CROCKER, MARGARET ELEANOR (RHODES), in New York City, December 1; born in Stark County, Ohio, February 25, 1823. Joined her husband in large charities and in beautifying the city of Sacramento. Gave works of art valued at \$500,000 and a fine school building to that city, and endowed an old ladies' home in New York City.
- CURRY, ROBERT, Ph. D., in Allegheny, Pa., December 13; born in Murraysville, Pa., June 8, 1821. Graduate of Washington and Jefferson College in 1848. Became principal of West Newton Academy, the normal school at Mansfield, and New Brighton Female Seminary. In 1873 was deputy superintendent of public instruction of Pennsylvania. Afterwards engaged in teaching in Nebraska.

- DAGGETT, MRS. LYDIA HILL, in Wyoming, October 2. She was engaged in educating the colored people under General Butler. She published the *Heathen Woman's Friend*, the organ of the Woman's Foreign Missionary Society of the Methodist Episcopal Church. She founded the Jesse Lee home in Alaska, and promoted the Lyndon Home for Indians in the State of Washington.
- DE GROOT, MRS. ANN B., in Mount Tabor, N. J., July 10; born in Mendham, N. J., February 28, 1813. Aided in establishing a home for the friendless in Newark, and established the Boylan Home for the education of colored children in Jacksonville, Fla.
- DENFIELD, LEWIS E., in Waverly, Mass., March 23; born in Westboro, Mass., September 26, 1854. Taught in Fairfax, Vt., and in Wellesley, Mass.
- DE PUY, W. H., D. D., in Canaan, Conn., September 4; born in Penn Yan, N. Y., October 31, 1821. Graduate of Syracuse University in 1845. Agent of the college and professor. Was the author of several books.
- DICKINSON, FLAVEL A., in New Mexico, January 22; born January 8, 1820, in Chenango County, N. Y. Graduate of Yale in 1841. Taught at Delaware, Ohio, and Fayette and Pulaski, Tenn.
- DICKINSON, JOHN W., in Newtonville, Mass., February 16; born in Chester, Mass., October 24, 1827. Graduate of Williams College in 1852. Taught in Westfield Normal School from 1852 to 1877, when he succeeded Dr. Joseph White as secretary of the State board of education. Was an indefatigable worker along the lines of developing the normal instruction of teachers and making efficient the system of the State in raising up good citizens. His opinions were greatly respected throughout the State. He was chairman of the local city committee and was associated with the Emerson School of Oratory.
- DOHERTY, REV. DANIEL H., S. J., in Boston, January 15; born August 3, 1858. Graduate of Boston College 1872. Taught in Woodstock, Md., College of St. Francis Xavier, New York, and College of the Holy Cross, Worcester.
- DONNELLY, IGNATIUS, in Minneapolis, January 1; born in Philadelphia, November 3, 1831. Educated in the public schools. Attempted to show Bacon as the author of Shakespeare. In Congress was an earnest friend of the Bureau of Education, and advocated the planting of trees by the Government.
- DRESSER, ALVIN C., at Portland, Me., April 26; born December 6, 1866, at Standish, Me. Graduate of Bowdoin College in 1888. He was principal of Gould's Academy, Bethel; of the Rockland High School, and of Brighton Academy. Later he engaged in the practice of law.
- DUFFIELD, JOHN T., D. D., LL. D., in Princeton, N. J., April 10; born in McConnellsburg, Pa., February 19, 1823. Graduate of Princeton College in 1841. He entered Princeton Theological Seminary in 1844, and in 1845 was appointed tutor of Greek in Princeton. From 1847 to 1854 was adjunct professor of mathematics at Princeton, and in 1854 was appointed to a full professorship. He was an abundant contributor to religious literature, and served as pastor of the Second Presbyterian Church and president of the board of trustees of Princeton College.
- EATON, JAMES WEBSTER, in Albany, N. Y., August 1; born in Albany, May 14, 1856. Graduate of Yale in 1879. Taught Latin and German in the Albany Boys' Academy. Was admitted to the bar in New York in 1882. Was professor of law in Columbia University. Was district attorney of Albany County for three years. In 1889 was appointed professor in the Albany Law School. From 1895 was treasurer of the school. Was lecturer in Boston University Law School. He published a number of works on law and was editor of *American Bankruptcy Reports*. Was long a member of committee on law reform of the State Bar Association.

EVARTS, WILLIAM MAXWELL, LL. D., in New York City, February 28; born in Boston February 6, 1818. Graduate of Yale in 1836. Was grandson of Roger Sherman. Taught school in Windsor, Vt. Was admitted to the bar in New York in 1841. In 1849 was appointed United States district attorney. He prosecuted the Cuban filibusters, afterwards conducted the Lemmon slave case. Was delegate to the National Convention at Chicago in 1860. Was at first for William H. Seward, and finally moved to make the nomination of Lincoln unanimous. Was elected to the United States Senate in 1885. During the civil war was engaged in most important legal cases, visited England and France semiofficially, and was the principal counsel for the defense of President Johnson in 1868; was afterwards made Attorney-General. In 1871 was counsel for the Government in prosecuting the Alabama claims. He was counsel for Henry Ward Beecher in his noted trial; his summing up lasted eight days. In 1877 he was the leading counsel of his party in the decision which made Mr. Hayes President, and began to publish the consular reports. In 1881 he was delegate to the International Monetary Conference at Paris. He delivered many orations on noted public occasions. Was trustee of the Southern education fund. He was a member of the Calvary Protestant Episcopal Church.

FAULHABER, OSCAR, in Haverhill, Mass., December 6; born in Isny, Wurtemberg, in 1832. Was educated at Stuttgart and Tübingen. Received his degree of Ph. D. at the University of Tübingen. Perfected his mastery of French in France. After a short residence in England, came to the United States, and was instructor in German and French at Harvard and professor of the same languages at Phillips Exeter Academy from 1874 to 1893, when he resigned. He afterwards taught in Robinson Seminary at Exeter.

FEE, JOHN G., LL. D., Presbyterian clergyman, in Berea, Ky., January 11; born in Bracken County, Ky., September 9, 1816. Graduate of Augusta College, Augusta, Ky., and also studied at Miami University, Oxford, Ohio, and Lane Seminary, Cincinnati, where he became so ardent an abolitionist that on returning home in 1844 he incurred his father's lasting anger by selling all his possessions and buying one of his father's slaves and setting her free. He then removed to Lewis County and there began his evangelistic work. The presbytery sought to suppress him. He suffered many indignities. He was fired at in his doorway. An assistant was flogged in his presence. While he was preaching at College Hill a mob of sixty surrounded the house with pistols and guns. He was dragged out and a man with a rope swore that he would hang him if he did not leave the county. But Fee persisted in his work and went on preaching, unarmed and unafraid. In 1848 the American Missionary Association came to his aid with \$200 a year. Cassius M. Clay, who had, in 1853, bought a large tract of land in the Kentucky mountains with the intention of keeping it forever free from slavery, asked Fee to become the pastor of the district. Fee accepted and began the foundation of Berea College, open to all without regard to sex or color, which has now more than 800 students. Mobs repeatedly threatened to break it up, and the members of the colony were driven from their homes, but the work prospered in their hands. - He built schoolhouses in the counties around, which were sometimes destroyed by fire. He lived to see opposition turned to favor.

FELLOWS, GEO. STEVENS, in Exeter, N. H., August 26; born in Galveston, Tex., November 4, 1859. Graduate of Amherst College in 1884. Teacher at Monson, professor in Maryland Agricultural College, and teacher in the high school, Washington, D. C. After teaching was engaged in mining onyx in New Mexico.

- FISK, FRANKLIN W., D. D., LL. D., in Chicago, Ill., July 4; born in Hopkinton, N. H., February 16, 1820. Graduate of Yale in 1849. Was four years professor in the seminary at Beloit, Wis. Was appointed professor at Chicago Theological Seminary in 1858, which position he held until 1900, and was president of the institution the last thirteen years of his incumbency. Acted as pastor and served in various pulpits. Was author of a manual of preaching, and highly esteemed by the religious public. Olivet, Yale, and Beloit colleges honored him with doctorates. After resignation from his professorship was made professor emeritus.
- FISKE, JOHN, LL. D., in Cambridge, Mass., July 4; born in Hartford, Conn., March 30, 1842. Graduate of Harvard in 1863, and of Harvard Law School in 1865. Lectured on positive philosophy at Harvard in 1869, and the following year was an instructor in that institution; was assistant librarian from 1872 to 1879, and was afterwards made member of the board of overseers. In 1881 he began an annual course of lectures at Washington University, St. Louis. He lectured on American history at University College, London, in 1879, and before the Royal Institution in 1880. After 1871 he delivered hundreds of lectures in the United States and Great Britain. He became a prominent expounder of the doctrine of evolution and published numerous historical and philosophical works. He was one of the editors of Appleton's *Cyclopædia of American Biography*.
- FISKE, LEWIS R., D. D., in Michigan, February; born at Penfield, N. Y., December 24, 1825. Graduate of Ann Arbor in 1850. Professor in Albion College and then in State Normal School, and in 1856 in the Agricultural College, from which he entered the ministry in 1863; became president of Albion College in 1878, which office he held until his death.
- FOSTER, FREDERICK F., in Weare, N. H., January 18; born in Winthrop, Me., November 3, 1843. Graduate of Dartmouth in 1865. Devoted himself to teaching in Maine, Massachusetts, and New Hampshire. Was very able in mathematics and languages.
- FOSTER, RICHARD B., D. D., in Okarche, Okla., March 30; born in Hanover, N. H., October 25, 1826. Graduate of Dartmouth in 1851. Engaged in teaching at Jacksonville, Ill. Was a free-soiler, and in 1856 one of John Brown's company at Fort Titus, where a cannon was first fired in a free-soiler's fight. In 1862 enlisted in the First Nebraska Regiment, and afterwards became first lieutenant in the Sixty-third Colored Infantry, United States Volunteers. He was in command of the rear guard at the battle of Palmetto Ranch, May 25, 1865, said to have been the last battle of the war in which cannon were used. At the close of the war he established Lincoln Institute, Jefferson City, Mo., a school for freedmen. In 1872 he resigned and entered the ministry as a Congregational pastor in Kansas. From 1890 to 1894 was county superintendent of schools. From 1896 to 1899 taught in Kingfisher College, Oklahoma.
- GARDNER, ANNA, in Nantucket, Mass., February; born there January 25, 1816. Was of Quaker ancestry. When a girl read the *Liberator* and became interested in the antislavery cause. In 1841 published the call for the first antislavery meeting in Nantucket, at which Frederick Douglass made his first public speech and electrified his audience. She delivered many lectures in the years immediately preceding the civil war, and after the war taught in the freedmen's schools in Virginia and North and South Carolina. Published a work of prose and poetry, entitled *Harvest Gleanings*.
- GILLESPIE, MRS. ELIZABETH D., in Philadelphia, October 13; born there January 5, 1821; great-granddaughter of Benjamin Franklin. Supervised hospital for wounded soldiers in the civil war. At the Centennial she was efficient on the

committee securing money and erecting and furnishing the Woman's Building. Was active among the poor in Europe. Led in organizing the Colonial Dames. Was interested in litigation to set aside the trusts provided for in the will of Benjamin Franklin, which failed.

GOERECHE, WILLIAM H., in Washington, D. C., July 19; born in Philadelphia March 17, 1838. Graduate of Pennsylvania Medical College, March 7, 1849. Was appointed demonstrator of anatomy until he was transferred to the professorship. He rendered important service in the line of his profession during the war, and was honorably discharged in 1866 with the brevet rank of lieutenant-colonel. After the war he served as professor in a medical college in Ohio, and later was referee surgeon in the Pension Office.

GOODALE, JAS. H., at Monticello, N. Y.; born in Orange County, N. Y. Was devoted to the care of the poor; superintended building the county insane asylum and established the Children's Home in Middletown, N. Y.

GRAHAM, Rev. ROBERT, in Pittsburg, Pa., January 20; born in Liverpool, England, August 14, 1822. Graduate of Bethany College, Bethany, W. Va., in 1847. Taught in Kentucky and Ohio; was president of Hamilton Female College, Lexington, Ky., from 1869 to 1875; professor in Kentucky University from 1875 to 1897, and professor emeritus from 1897 to the date of his death.

GREEN, THOMAS PORTER, in Canastota, N. Y., July 4; born in Auburn, Mass., August 11, 1818. Graduate of Amherst College in 1836. Was mainly devoted to teaching; taught in Connecticut, Massachusetts, and Waterloo, N. Y., and later engaged in mercantile business.

HAILE, W. H., at Springfield, February 13; born in Chesterfield, N. H., September 28, 1833. Graduate of Dartmouth in 1856. In the State legislature and elsewhere promoted education. Was mayor of Springfield.

HAILE, HORACE M., in Denver, Colo., October 24; born in Hollis, N. H., March 6, 1833. Graduate of Union College in 1856. Taught in New York and in Nashville, Tenn. Was county superintendent in Colorado, and from 1873 to 1876 Territorial superintendent of public instruction; while holding the latter office he drew the bill which became the fundamental school law of Colorado upon its admission as a State; in 1887 was made president of the State University.

HALL, FITZ EDWARD, LL. D., in Suffolk, England, February 1; born in Troy, N. Y., 1825. Graduated at Rensselaer Polytechnic Institute in 1842 and at Harvard in 1846. Was professor in India, and in King's College, London. Was a distinguished oriental scholar.

HARRINGTON, B. T., in Westchester, N. Y., December 13; born in Heath, Mass., June 1, 1826. Graduate of Amherst in 1852. Was a teacher for over fifty years.

HARRISON, BENJAMIN, in Indianapolis, Ind., March 13; born in Northbend, Ohio, August 20, 1833. Graduate of Miami University in 1852. Studied and afterwards practiced law. In 1860 was elected reporter of the State supreme court. Was colonel in the civil war; distinguished himself in various battles. Was member of the Mississippi River Commission. Was elected to the United States Senate and took his seat March 4, 1881. Was chairman of the Committee on Territories. Secured the passage of laws for Alaska. Was noted as an able debater. Was inaugurated as twenty-third President of the United States March 4, 1889. His administration was noted for the defense of American interests abroad and for the promotion of industry and prosperity at home. In 1892 was renominated for President and was defeated. Resumed the practice of law. Delivered a course of lectures at Stanford University. Was

counsel in international cases. Was appointed member of The Hague peace conference. Gave much time to church and beneficent work. He was a member of the committee on creed revision of the Presbyterian Church.

HERRICK, HENRY JUSTUS, in Cleveland, Ohio, January 28; born in Aurora, Ohio, January 20, 1833. Graduate of Williams in 1858. Was a surgeon in the Army. Was a prisoner in Libby, and after parole took part in Sherman's march to the sea. After the war settled in practice in Cleveland and became professor of medicine in Western Reserve University, and so continued until his death. Stood high in his profession.

HERTZOG, J. G., in Philadelphia, Pa., September 12; born in Bechtheim, Germany, January 2, 1831. Educated there. Teacher of languages from 1850 to 1864 in La Salle College, Philadelphia, and from 1877 until his death principal of a private school.

HILDER, F. F., in Washington, D. C., January 20; born in England. Was educated at Rugby, and entered the Indian service. He afterwards came to this country. His geographical eminence attracted attention and he was active in promoting education in this line. He visited the Philippines in the interest of ethnology, made valuable collections, and furnished interesting information.

HINTON, RICHARD J., in London, England, December 20; born there in 1830. Removed to the United States in 1851. Worked at his trade of mason; became topographical engineer; was journalist, lawyer, and author. Traveled in the South as the Confederacy was forming, and saw Jefferson Davis inaugurated. He served through the civil war; participated in the Cuban uprising in 1870. In 1886, as a labor expert, wrote for the Labor Bureau and for the Bureau of Education on education and labor. Was an ardent abolitionist.

Taught in Philadelphia, and in 1851 became professor at Bucknell University, in Pennsylvania. In 1882 became president of Monongahela College, Pennsylvania. Was engaged in educational work all his active life.

JAMES, H. M., August 5, at Chapel Hill, N. C.; born at Troy, Ohio, March 3, 1837. Graduate of Williams in 1861. Teacher in Cleveland, Ohio. Superintendent of schools at Omaha, Nebr., Portland, Oreg., and in Tacoma, Wash.

JANES, LEWIS G., in Greenacre, Me., September 5; born in Providence, R. I., February 19, 1844. Received the degree of A. M. from Brown University. Was president of the Brooklyn (N. Y.) Ethical Association from 1885 to 1896, instructor in history in Adelphi Academy in 1894 and 1895, and lecturer on sociology in the School of Political Science, Brooklyn, from 1893 to 1896. In 1896 became director of the Cambridge Conference and the Monsalvat School of Comparative Religion, and in 1899 president of the Free Religious Association. He published various books.

JOHNSON, WILBUR, in Canterbury, Conn., February 9; born in New York, March 1, 1831. Graduate of Yale in 1856. Taught in Massachusetts and Connecticut.

KENT, A. E., at Genoa, Nebr., January 8; born at Suffield, Conn., September 1, 1830. In 1885 furnished funds for the erection of the Kent Chemical Laboratory, and in his will left a liberal bequest for its enlargement.

KING, CLARENCE, in Phoenix, Ariz., December 24; born in Newport, R. I., January 6, 1842. He was for three years under Professor Whitney in the California geological survey. He made the first survey of the Yosemite Valley. Under the United States he was occupied five years (1867 to 1872) in making the "survey of the fortieth parallel." He detected the effort to salt certain lands with diamonds. He originated and promoted the plan for a permanent geological bureau, and after its establishment served for three years as its head. Was a member of the National Academy of Sciences.

- KLEINSORGE, J. A.,** Ph. D., at Denver, March; born in Iowa. Received his Ph. D. degree from Jena, Germany. Graduated at Cedar Falls Normal School, and his short life was specially devoted to normal instruction. Was called to the New York State Normal School at Oswego, and at the time of his death was in charge of Training School and pedagogy of the normal school at Greeley, Colo. Was a young man of great promise.
- KYLE, JAS. H.,** in Aberdeen, S. Dak., July 1; born in Xenia, Ohio, January 24, 1854. Graduate of Oberlin in 1878, and of the Western Theological Seminary, Allegheny, Pa., in 1882. Devoted himself to educational and pastoral work in Utah and Colorado. Was elected Senator from South Dakota in 1890, and was reelected in 1897. Was Chairman of Committee on Education and Labor.
- LAY, JOHN FOOTE,** September 27, in Batavia, N. Y.; born in Batavia, May 1, 1822. Graduate of Yale in 1841. Studied law and was admitted to the bar in 1844. Was secretary of the board of education for nine years, trustee of Batavia union school, and an active member of the committee which superintended the erection of its fine building, completed in 1874. Was afterwards appointed regents' examiner at the school.
- LEAVENWORTH, ABEL E.,** in Castleton, Vt., June 3; born in Charlotte, Vt., 1828. Graduated at the University of Vermont in 1852, and became principal of Bolivar (Mo.) Academy. In 1855 took charge of Hinesburg (Vt.) Academy. Was editor and proprietor of the State School Journal and principal of the West Brattleboro Academy from 1859 to 1862, when he enlisted as sergeant in the Ninth Vermont Volunteers. Was appointed captain in 1864. From 1863 was assistant inspector-general of Wistar's brigade and assistant adjutant-general until 1865. After the war was again principal of Hinesburg Academy and later of Beaman Academy. In 1874 took charge of the normal school at Randolph, Vt., and in 1881 of Castleton Seminary and Normal School. For two years was president of the Teachers' Association of Vermont.
- LE CONTE, JOSEPH, LL. D.,** in Yosemite Valley, Cal., July 6; born in Liberty County, Ga., February 26, 1823. Graduate of the University of Georgia in 1841 and of the College of Physicians and Surgeons in 1845. Began the practice of medicine, but left it to enter Lawrence Scientific School, Harvard, where he studied the natural sciences and geology under Louis Agassiz, receiving the degree of B. S. in 1851. Spent some time with Agassiz in exploring the reefs and keys of Florida. In 1852 was chosen professor of natural science in Oglethorpe College, but resigned in 1853 to accept a professorship in the University of Georgia. In 1856 became professor of geology and natural history in South Carolina College, where he remained until 1862, when college work was abandoned. During the war was chemist in the Confederate government laboratory and in the niter and mining bureau in Columbia, S. C. In 1866 again became professor in South Carolina College, but two years later joined the original faculty of the University of California as professor of geology, botany, and natural history, which chair he held until his death. Was member of the National Academy of Sciences and one of the editors of the Journal of Geology.
- LINSLEY, JOSEPH H.,** in Burlington, Vt., February 17; born in Windsor, Vt., May 29, 1839. Graduate of the University of Vermont in the medical department in 1880. Was lecturer on physiology and instructor in microscopy and chemistry in that institution. Was appointed instructor in clinical microscopy in the New York Post-Graduate Medical School, and became director of laboratories in St. Luke's and Presbyterian hospitals. Later was professor in University of Vermont.

- LYON, APPLETON P., in Mount Vernon, N. Y., November 27; born in Erie, Pa., June 12, 1840. At 16 was tutor in a normal school, Lebanon, Ohio, and later professor of mathematics in the same school. He studied at Brown, at Amherst, and at Union Theological Seminary. Was the friend and adviser of students and botanists. His library was one of the best botanical libraries in the United States, and was much used for reference. It contained at the time of his death 22,000 books and pamphlets and a collection of 265,000 classified pictures of plants, with texts, to compile which took Professor Lyon and his wife twelve years.
- MAPES, WALTER DECKER, July 30, in Brooklyn, N. Y.; born in Matamoras, Pa., September 26, 1863. Graduate of Williams College in 1886. Was instructor at Williams one year; at Central High School, Cleveland, for twelve years, and the last year of his life taught at Erasmus High School, Brooklyn.
- MARKOE, THOMAS M., M. D., at East Hampton, N. Y., August 26; born in Philadelphia September 13, 1819. Graduate of Princeton in 1836 and of the New York College of Physicians and Surgeons in 1841. Was professor of surgery in the latter institution for thirty years (1860 to 1890).
